Mr. St. John Hope, the secretary of the Society of Antiquaries, who has been in charge of the excavations both of 1893 and 1894, then proceeded to explain what had been accomplished this year, and how far the mapping out of the ground-plan had been carried. They had completed the excavation of the church by uncovering the walls of the south chapel, about 30 feet long, which was entered by an archway from the south side of the nave. In this chapel the altar had been found stripped of its covering slab, but still fairly perfect, whilst the original tiles of the altar-face were yet in position. The unusually large chapter-house on the east side of the cloister had been chosen as the site of a small kiln erected there for the purpose of obtaining lime from the old chalk-walls by the first set of demolishers; but still a good deal of the chapter-house area was not much damaged, and the side benches and the raised platform at the east end and patches of ornamental floor-tiles had been found. The outer walls and central pillars of the ground-plan of a groined undercroft that ran beneath the great dormer or dormitory had also been found on the same side of the cloister. On the north side the vaulted rooms beneath the frater or refectory had been uncovered, as well as the cellarers' block to the west. The kitchen, with hearth and ovens, was found at the north-west angle of the cloisters. A variety of outlying buildings and enclosing walls had also been tested. The smaller finds included many good varieties of early pattern tiles, a great variety of Mediaeval broken pottery, some of much interest, beautifully-designed lead ventilators for windows, fragments of glass, keys, a small pair of shears, a colour-palette formed of a thin tablet of marble, &c., which were carefully inspected by the visitors. The moulded stones of different dates that had been uncovered were

arranged according to their periods, and clearly labelled for the advantage of visitors. These will shortly be moved to the vestry of the parish church, where most of those of last year are already placed.

A short visit was also paid to the closely adjacent parish church. It is built of Mediæval brick with stone facings. Dr. Cox briefly described it. In the chancel are two Early English windows in the north wall, and on the opposite side is a small piscina drain of the same period. Dr. Cox believed that these thirteenth-century windows are in brickwork of the same date, and that they have not been rebuilt into it at some later period as others suppose. He said he was satisfied that there were three stages of brickwork in the edifice which made it of exceptional interest, namely, thirteenth-century, fifteenth-century (the date of most of the building), and a general repair in 1706, the bricklayer's name of that date being recorded on a south buttress. The bricks of these three periods had all their own characteristics and shapes, and each of them differed from their modern successors.

Mr. and Mrs. Beckitt kindly entertained the members to tea in their beautiful garden, and a most cordial vote of thanks was passed to them for their hospitality, and for Mr. Beckitt's kindness in putting up with all the inconveniences that are necessarily connected with excavations on pasture land.

The winter meetings have been already planned, as well as summer excursions in May and July, the annual meeting for 1895 to be held in September at Bridlington.

HOUSING OF THE WORKING CLASSES.

A PAPER on "The Housing of the Working Classes: Sanitary Powers relating thereto in Liverpool," was read by Mr. W. Goldstraw, surveyor of buildings, Liverpool, at the Sanitary Congress. He said when the era of sanitary legislation began to dawn, more than fifty years ago, Liverpool was the first town to set a good example. In 1842 a local Act was passed "for the promotion of the health of the inhabitants" and "the better regulation of buildings." Before that date builders of house property were on the whole left free to build as they pleased, so far at least as concerned questions of health. The chief points in which the Liverpool Building Act, 1842, aimed at improving the sanitary conditions of dwellings were these:—"Increased width of streets and courts, prohibition of certain cellar dwellings, ventilation of rooms, provision of sanitary conveniences." Mr. Goldstraw then alluded to the other Acts passed, including the Liverpool Sanitary Act, 1846, the Sanitary Amendment Act, the Liverpool Improvement Act, 1864, the by-law made in the same year on the subject of open spaces in connection with dwelling-houses, the Liverpool Improvement and Waterworks Act, 1871. In the same year the restrictions as to occupation of cellar dwellings were further amended in certain details by a Local Improvement Act. But best of all in this regard the Public Health Act, 1875, had clearly laid down that no cellars were to be occupied as dwellings unless they were lawfully so occupied at the passing of the Act, and not even then unless certain structural conditions are fulfilled. It hardly need be said that no cellar dwellings had been constructed in Liverpool for more than twenty years past. Further powers affecting dwelling-houses were obtained in the Liverpool Improvement Act, 1882, when the Corporation were enabled to deal more effectually with cases of land filled up with offensive material, of streets laid out in awkward directions, of houses being built with damp foundations and of buildings occupied as dwelling-houses. The next sanitary measure bearing on the subject was the Liverpool Improvement Act, 1889. The chief provision was the prohibition of any erection on the existing open spaces in connection with houses unless in accordance with certain regulations. These regulations were afterwards applied with great advantage to all new houses by the adoption of a new by-law in 1890. He made no reference to the rather numerous and complicated statutes known as the Artisans' Dwellings Act. With this very large exception, they had now traced in outline all the general sanitary powers of the Corporation with regard to the housing of the working classes, and it only remained to inquire what was the broad result, as seen at the present time? The answer to this question might best be given briefly in the form of statistics taken at the end of 1893. The number of dwelling-houses of all kinds at present existing in the city was 106,946. Of this number it was reckoned that about 82,444 were let at gross rentals of not more than 20*l.* a year, or 7*s.* 8*d.* a week. It might therefore be said that 77 per cent. of the dwelling-houses within the city were occupied by the working classes. Out of this number of 82,444 houses of the working classes, 26,182, or 32 per cent., had been erected since 1864, under the improved regulations, and might be regarded as being in a fairly sanitary condition, and having sufficient open space. A further distinction might be drawn by classifying the occupiers of houses of which the gross rental was not more than 13*l.* a year, or 5*s.* per week, as

"the labouring class." Under this heading there were in the city about 40,400 houses, *i.e.* 38 per cent. of the whole number of houses in the city. In this number of labouring-class houses there appeared to be about 14,600 which were "insanitary," and which ought to be demolished or structurally improved. This might seem a large number, but it should be stated that during the thirty years that the Corporation had had the requisite powers 4,126 houses had been so dealt with. It might, therefore, be reasonably expected that during the next thirty years the remainder would be cleared away by the action of the Corporation, combined with the forces of natural decay and of lawless destruction. When that consummation was reached it might be hoped that Liverpool would have a labouring population moderately well housed. But as a precedent condition it would be necessary that the newer houses be let at such rentals as "the labouring class" could afford to pay. This was certainly not the case at present, for the smallest houses now being built (with the exception of a very few tenement houses) were generally let at rentals of 5*s.* 6*d.* per week, which was about double the sum which thousands in that rank of life could possibly spend on house-rent. These unfortunate or unthrifty ones now inhabited the dilapidated, and insanitary houses which must, in no long time, disappear. But where would they or their like successors live when the court houses and cellar dwellings had gone? This problem was still unsolved, yet they might hope that it was not unsolvable.

Mr. H. Percy Boulnois, city engineer of Liverpool, read a paper on "The Housing of the Working Classes: Tenement Houses, or Dwellings in Flats." It might be well, he said, to define the expression "working classes" for the purpose by taking it to apply only to the tenants of houses which were rented at not more than 20*l.* a year, or about 7*s.* 8*d.* per week—a limit which was quite sufficiently high. It might also be premised that one condition which had been rather strongly insisted upon was that the rent to be paid by the poorest of working people ought not to exceed an average of one shilling per room per week. Now it was a fact which would cause no surprise that in Liverpool the nearest approaches which had been made towards a compliance with this requirement had been in "tenement" houses or dwellings in "flats." As to the ordinary houses, all those which had been built in this city during the last thirty years might be said to come under two classes—six-roomed houses letting at a rent of about 7*s.* 6*d.* per week, and four-roomed cottages letting at a minimum rent of 5*s.* per week. It might therefore be reckoned that the rents of the usual modern houses averaged 1*s.* 3*d.* per room per week. It was said that these rents were too high for labouring men who earned only 20*s.*, or perhaps only 18*s.*, per week when in regular employment, and too high also for those whose weekly earnings were from 24*s.* to 30*s.*, but were reduced to an average of 15*s.* to 20*s.* per week by the lack of regular work. It was urged that persons of this condition in life could not possibly pay more than one-fifth of their income in rent, and even that was double the proportion paid by those more well to do. None of the cottages built in Liverpool since 1864 could be let at 1*s.* per room per week. And it was hardly probable that any such would be built in the near future, unless, perhaps, on certain sites which might have been cleared of insanitary property by the Corporation and too shallow to contain four-roomed cottages of two rooms in depth. An objection was frequently made that houses containing less than four rooms ought not to be permitted. In response, it could only be said that there were many families which do not require more than two or perhaps three ordinary rooms for reasonable conditions of decency and health, and many more which could not possibly pay a greater rent than those two or three rooms must of necessity command. Now, there was a comparatively large number of houses erected in rows or blocks of two storeys in height, in which there was on the "ground floor" level a series of complete houses, each containing two or three rooms, and on the "first floor" level another set of complete houses of the same dimensions as those below, each one entered by an independent stair directly from the street. These are commonly known as "Scotch" houses, though the term appears to be rather a misnomer. Of "tenement" houses, "terrace" houses or dwellings in "flats," more properly so-called, there are about 120 blocks containing some 3,000 houses or dwellings. They varied somewhat as to size, arrangement and rental, as there had been a degree of development in their characteristics. He proceeded to describe them as nearly as possible in order of date. In the first place, he described a certain attempt to provide cheap dwellings in 1863, these dwellings being three storeys in height and let at rentals of from 1*s.* 4*d.* to 1*s.* 2*d.* per room. In an adjoining street dwellings four storeys high were erected in 1867, and were let at from 1*s.* 10*d.* to 1*s.* 4*d.* per room. Both were built by an able and enterprising builder, who still retained the ownership. The net rent on outlay was 4 per cent., 17 per cent. of the dwellings being at present unoccupied. The next instance were three-storey blocks built in 1865, and let at from 4*s.* 6*d.* to 5*s.* 9*d.* per dwelling. There were fifty-one

tenements. The original owner regarded the venture as a failure. Mr. Boulnois then described a tenement block of different kind built in 1867, and consisting of tenements of four and six rooms. The rents were 3s. 6d. and 5s. 6d., which were less than 1s. per room per week, but the profit on capital invested was *nil*. He proceeded to speak of the erection by the Corporation of St. Martin's Cottages, Sylvester Street. The lettings of these buildings were at the rate of from 1s. 3½d. to 1s. 7½d. per room. The net return had averaged 3½ per cent. These cottages were a strong and intelligent effort to make a worthy contribution to the necessities of the times, and no important improvement had been made in subsequent designs. In 1868 two blocks of 150 dwellings each were erected by a public-spirited company, but recently the property was transferred to a private owner. From 1869 to 1871 two large blocks were built near to the northern boundary of the borough, and very near to the line of docks. Each block occupied the whole of one side of a street which opened at each end into a main road where tramways were laid. No conditions could be more favourable. A large common open space was provided at the rear of each block. Each of the three storeys formed a separate "flat" and had a continuous balcony running along the front. Every house consisted of a living room, three bedrooms and a scullery with other convenient places, making practically a five-roomed tenement. But even if they reckoned it as having only four rooms, it would be found that as the rents were 5s., 4s. 6d. and 4s., according to the height, the rate per room was but 1s. 3d., 1s. 1½d. or 1s., as the case might be. And as the rent included a free gas supply, worth, say, 3d. per week, the rate per room was actually reduced to 1s. 2½d., 1s. 0¾d. and 11¼d. Surely, it would be said, here was a success. Unfortunately the facts told a different tale. Whether it was that the houses were practically too large for the wretched class of tenants, who might prefer a two-roomed house at half a crown a week to a four-roomed one at 4s., or whether the property generally was rather unattractive from its want of repair—not a strong reason with such tenants—certain it was that the houses "let" badly. Out of 180 tenements in the street there are 41, or nearly 23 per cent., unoccupied, and many had apparently been so for years past. Almost all were dirty and somewhat disreputable-looking. The fine open spaces at the rear were of no advantage as either drying-grounds or playgrounds; they were places for refuse and ruffians. One section of the property was under the management of an agent of wide experience and high standing, who evidently was striving to keep it in good repair, and to secure fairly suitable tenants. Yet he assured him (Mr. Boulnois) that "the rents collected were not sufficient to pay charges, namely, rates, gas and ground-rent." He had dwelt on this example because it was typical of a number of similar cases. It was during the years from 1863 to 1871 that the tendency to the erection of dwellings in "flats" was most strongly manifested. Trade was good and wages high; the newly-erected tenement property then paid easily 10 per cent. on the outlay. In many of these cases the return was now practically nothing. After that time there was no movement of special interest until 1883, when the Corporation undertook the erection of the Victoria Square Dwellings, on a site cleared of insanitary property by a compulsory demolition known as the Nash Grove scheme. These imposing erections were designed by the city engineer of that time. The cost of the buildings alone was 58,000*l*. They were five storeys in height, and 272 tenements had been provided at rentals of 5s. 3d. for three rooms, 4s. 3d. for two rooms, and 2s. 9d. for one room, inclusive of gas. It would be seen that the rates per room, when 3d. per week was deducted for gas, were 1s. 8d., 2s. and 2s. 6d.—much above the 1s. standard. The Corporation were able to secure the reasonable return of 2½ per cent. and to provide good houses at a moderate rent; but the problem before them was hardly one step advanced. In 1887, however, the Corporation made another incursion into the region they were exploring. They erected on the opposite side of the street four blocks of tenements, each four storeys high and comprising 100 separate dwellings. They were erected to the premiated designs of eminent Liverpool architects, and formed probably one of the best examples of good and inexpensive dwellings on the block system which had yet been devised. The interest received by the Corporation on the total cost was about 3½ per cent. The rentals of the two classes of dwellings are as follow:—Two rooms, 4s.; one room, 2s. 6d. It appeared therefore that the desired one shilling rate had not been reached. It now only remained to refer to the latest instance, which was on a small scale. An owner of property who had had a wide experience had just finished the erection of twenty self-contained cottage "flats," in blocks of two storeys. They were planned by an able civil engineer and architect, fully acquainted with all the conditions of the problem. This was in a great degree a reversion to the type of the so-called "Scotch" houses. But it is a developed type. The upper houses had a small yard at the rear, on the same level as the living rooms, and the water-closets and dust-shoots are detached from the main building.

There was a rather large open space on the ground level at the rear of each house, the by-law in that behalf being fully complied with. Each tenement consists of two rooms, and is let at a rental of 5s. and 5s. 6d. per week. Here, then, we have a case of the looked-for kind of houses—houses having the character of independent cottages, with a reasonable minimum of accommodation. The great point of interest was whether in twenty-five years' time it would be found that, in spite of all leakage and deterioration, this property, from the owners' point of view, will sufficiently justify its existence. This last-cited example was one of several indications that the ordinary builders and owners of cottage property did not now regard the "tenement" or "flat" type of house with favour. It was evident that the ordinary builder would not readily undertake the supply. So far as he was concerned, the past experiments had been chiefly failures. The dilapidated and dirty condition of the tenement blocks which were in the hands of individual owners, and the great losses which those owners undoubtedly suffered from low-class and unmanageable tenants, seemed to point to the conclusion that such blocks should be owned and managed by powerful bodies, companies or corporations, who could and would keep both the buildings and the tenants in fairly decent order. The cheapest of cheap dwellings were unquestionably wanted; they could only be supplied by the strongest of strong hands.

Sir Francis Powell said the two papers had made it clear that the cost of providing dwellings in which the humblest classes might live in circumstances of decency was in excess of the wages which those classes had at their command. The more they discussed the question the more difficult did it appear. Parliament had fully armed the municipal authorities with the powers to erect those dwellings, but his own doubts had been increased almost to a certainty that it was impossible to make this enterprise attractive to private capital, because if they built houses cheaply the life of those houses would, from the character of their occupants, be short; so that in the long run the cheaply built house would be no more remunerative than the dearer one. He was adverse to having the common fund of the community used in competition with private capital, and yet they were driven to the conclusion that if they were to deal with populations of a humble type densely gathered together in limited areas as in Liverpool, they must have recourse to a public fund. Practically, they could accommodate these people in no other way.

Dr. Sykes said the London County Council did not derive more than 3 per cent. on their outlay at a standard rental of 2s. 6d. per room; the rental per room was in no case less than 2s. If Liverpool could not make this class of dwellings pay, the problem appeared, as far as London was concerned, unsolvable.

Dr. Pernewan asked why the Liverpool Corporation had not put the Housing of the Working Classes Act into operation over the large insanitary areas of the city? There could be no question, in his opinion, that buildings of this class must be done by corporations.

Mr. H. H. Collins said that in Deptford there were in existence whole streets of tenements which paid their owner 6 and 7 per cent. He suspected that the failures recorded lay very largely in management, and in the tenements being allowed to fall into dilapidation. Another difficulty was the increased cost of building, which he attributed to strikes and want of care, judgment and generosity on the part of workmen. It was right that if the latter created the difficulty they should pay for it in increased rent. He deprecated private enterprise being discouraged, and mentioned that the Rothschild buildings in London paid 4 per cent. Mr. Robert Vigers, an administrator of the Peabody fund, found that dwellings built in London on the Peabody system could not be let at less than 1s. 10½d. per room per week. The dwellings erected by private enterprise let at 7s. 6d. per four-roomed flat, which was self-contained. It was preferable that dwellings should be erected by wholesome enterprise rather than either by public bodies or by philanthropists.

Mr. C. S. Pain regretted that the experiments in tenement houses in Liverpool had not been successful, because if this provision had to be made by corporations it would be made without that moral influence on the tenants which was exercised, for example, by Miss Octavia Hill, and could be brought to bear by philanthropic private persons.

Professor Spinks condemned back-to-back houses, and pointed out that it had gone forth from the Congress that they had been spoken of with approval. In Salford the death-rate in houses of that class was 50 per cent. in excess of the mortality in houses with through ventilation.

Mr. Boulnois, replying, said he had arrived at the 1s. per room standard as being all that labouring men ought to be called upon to pay. The Artisans' Dwellings Act had not been put in force because the compulsory acquisition of valuable properties would mean a heavy burden on the ratepayers.

The President, in closing the discussion, desired to say that the approval of back-to-back houses had not been expressed by any body holding an official capacity in the present Congress.

SANITATION IN LIVERPOOL.

THE subject selected by Mr. G. F. Deacon for his presidential address in the Section of Engineering and Architecture at the Sanitary Congress at Liverpool was the sanitation of the city, many of the works having been carried out by him. He said:—

It is natural, and it will no doubt be expected, that this great city, in which for twenty-five years, beginning in 1865, I was professionally engaged, should receive the first share of my remarks, and it is natural also that a later portion should be devoted to the Metropolis, to which some years ago I gravitated, in that spirit of evil centralisation which as sanitarians we all so greatly deplore, but nevertheless recognise as an inevitable incident of modern life. In his masterly address as president of the health section of the Social Science Congress held in Liverpool eighteen years ago, the late Mr. Thomas Hawksley pointed out that the habit of sanitary philosophers to regard the health of Liverpool as exceptionally and pre-eminently bad, was even then not justified. Mr. Hawksley compared the state of Liverpool with the state of the other large cities most nearly approaching her in magnitude—namely, Manchester and Glasgow—showing successfully that even at that time the comparison was favourable to Liverpool; and, if we continue the investigation, we find that from 1876 the relative death-rate of Liverpool has very materially decreased. But when in conjunction with these facts we take into consideration the circumstance that the mean density of the population of Manchester and Glasgow, though lower in 1876 than that of Liverpool, has decreased, owing partly to the extension of boundaries, much more rapidly than in the case of Liverpool, and that the absolute density of Manchester is now only 40 per cent. and of Glasgow only 58 per cent. of that of Liverpool, the significance of the change becomes still more striking. According to the Registrar-General's returns the number of persons per acre at the different dates had been as follows:—1871: Liverpool, 97.0; Manchester, 78.0; Glasgow, 95.0. 1876: Liverpool, 100.1; Manchester, 83.4; Glasgow, 90.4. 1893: Liverpool, 97.9; Manchester, 39.9; Glasgow, 57.3.

If instead of considering the total mortality in the towns very appropriately compared by Mr. Hawksley, we regard only the deaths from those zymotic diseases which are chiefly affected by sanitary conditions, and make the comparison with the seventeen large towns and cities of England for which, in addition to Liverpool, the Registrar-General in 1872 enumerated the zymotic diseases separately, we find an equally satisfactory improvement. It appears that, compared with the other seventeen towns having a density of population only one-third that of Liverpool, the excess of mortality in Liverpool from the diseases in question, which prior to 1876 was nearly 2 per 1,000, has from 1876 onwards been less than 1 per 1,000.

If now, instead of investigating the mortality returns of the great towns of this country and discovering by that investigation that at or about the beginning of 1876 a change took place for the better in the health of Liverpool which was not equally shared in by the mean of the other seventeen towns, we study the history of her sanitary engineering—of the physical development of those principles upon the importance of which we, as sanitarians, are substantially agreed—what do we find? Running over the various operations of the whole twenty-five years we notice, for example, that remarkable activity was shown between the years 1871 and 1875. Let us begin with the water supply. From the year 1865 the supply had been intermittent, under conditions which, as I had occasion to report at the time, and firmly believe now, caused impurities of the most serious kind to find access to the mains during the intermissions, and to be delivered to consumers on each occasion of the resumption of supply. In 1874 the remedy for this state of things was begun. On the last day of 1875 every district of Liverpool had been provided from the old sources with a constant supply of water under higher pressure than before. On that day the valve of the last intermittent district was turned full open with much circumstance and rejoicing by the then chairman of the water committee, the late Mr. J. H. Wilson, to whose energy and steadfast conviction was largely due the completeness of the success attained, and thus before our critical year of 1876, Liverpool has received the full blessing of a constant supply, which has rarely been interrupted since.

To turn now to the sewerage. It had been the dream of my predecessor, the late Mr. James Newlands (the first borough engineer created, for he, like his successors, held office under a special Act passed in 1846), to seal hermetically the whole of the sewage directly it passed into the drains. It was a greatly to be desired vision, but one which, as we now well know, never could have been realised. It was essential that there should be a flow of pure air into the sewers, and accordingly before 1876 the system of ventilation now in operation, consisting simply of the familiar open grid in the middle of the carriageway, had been largely carried out. But this work was not undertaken without first considering in each case the

internal condition of the sewer to which it was to be applied. Except when actual renewal was called for, the worst sewers were thoroughly repaired, and provided where necessary with new inverts of Portland cement. Sewers so treated and others in good condition were then ventilated, without causing the slightest nuisance except in the neighbourhood of places where they were used for the discharge of hot water or steam. By my immediate successor, Mr. Dunscombe, and by my successor Mr. Boulnois, this work of sewer renewal had been most ably continued. It possessed features which were, I believe, novel when the work was begun, and which, so far as I know, had not been adopted elsewhere. I commend them to the attention of all engineers who had to deal with old sewers. The principal other sanitary work carried out before the critical year of 1876 was the removal of the cellar water taps and the closing of the cellar drains in a large proportion of the houses of 1,674 courts occupied by the lowest classes. These private drains and their traps were generally defective, and the work of closing them was done by the Corporation as a result of a bargain with the landlords concerning the supply of the substituted water-fittings—a suggestive instance of the advantage of municipal control of waterworks. Before the same critical date many other sanitary improvements were made; impervious paving, for example, was introduced in 1871, and has since been rapidly continued; but the changes of greatest importance I have already enumerated, and it was impossible not to be struck by their coincidence with the great comparative reduction of zymotic and general mortality. The conclusions I leave to others, only remarking that it must be exceedingly satisfactory to the people of this great city to know that the reputation for pre-eminently bad health had long ceased to be merited, and that when properly compared with other similar places the health of Liverpool takes a high position.

Liverpool has the good fortune to be situated upon a great estuary, and to experience but little difficulty in disposing of her refuse. The liquid sewage is discharged into a wide and deep channel, which also receives and discharges twice daily during neap tides 282,000,000 cubic yards, and at spring tides no less than 700,000,000 cubic yards of water—volumes so enormous in relation to the sewage that, prosper as Liverpool may, there can never be any sound objection, if the outfalls are properly chosen, to maintaining the present condition of things. The population within the watershed of the Mersey is less than twice that within the watershed of the Thames above Molesey, near which place 70 per cent. of the London water-supply is drawn, while the mean ebb of the Mersey is about 140 times that of the mean discharge of the Thames past the same place.

Again, as regards the disposal of solid refuse, Liverpool is well placed. In 1871, when I was first called upon to inquire into the matter, all such refuse was sent away by railway or canal, or used for filling up claypits. In 1872 I used with success a considerable quantity of asphalt refuse for the purpose of raising steam. The possibility of conveying this refuse to sea was also investigated, and in 1879 the *Alpha* was designed and built. She carried 380 cubic yards, and on reaching her destination in the outer estuary of the Mersey beyond the bar, at a distance of about twenty-two miles from the Liverpool landing-stage, deposited her load in a few seconds in deep water. The low cost of this mode of disposal left little room for the successful competition of "destructors," and for a time burning was suspended. But with the rapid extension of suburban Liverpool the available outlets in a landward direction have year by year diminished, and the present city engineer, Mr. Boulnois, has very successfully revived the destruction of a portion of the refuse by fire. There is absolutely no objection to tipping this refuse into deep water, and where it is the cheapest it is the best course to adopt. Where it is not the cheapest, destruction by fire, with proper precautions, is from a sanitary point of view quite satisfactory. The combustion may be made complete, and there need not be a sign of smoke.

In 1869 Mr. William Williams, a very ingenious member of the Corporation of Liverpool, patented a joint for cast-iron pipes on the principle, not of the ball and socket, but of the sphere and cylinder, and that principle has since been applied to stoneware pipes. Under certain conditions to be attained by sufficient and intelligent inspection and by the use of proper jointing material and special but simple pipe-laying apparatus, the principle of such joints may be employed with perfect success and even with economy in first cost. Pipes so jointed may be rapidly laid in any ground. The spherical segment and its containing cylinder admit both of flexure and longitudinal extension, and if the jointing material is satisfactory it will permit, as I have ascertained on a large scale, of far more movement than in practice ever occurs while the ground is settling down, and that without any leakage even under pressure, and I have no doubt other methods of securing the same end may be devised. This being so it is to be hoped that engineers will in future insist upon water-tightness—not merely upon the insertion of the word in the specification, but upon

the antecedent conditions necessary for its attainment, and upon its actual accomplishment by the contractor. This absence of water-tightness is a serious matter in point of expense. It is a still more serious matter in its sanitary aspect. There is certainly room for great improvement in these matters, but we cannot hope to attain even approximate perfection. The thought of this and of inevitable increase in the density of our population emphasises in my mind the very strong feeling that for our supplies of potable water we ought so far as possible to go beyond the limits of human habitation.

Returning to Liverpool, I find it necessary to revert to the water-supply. The facts are not difficult to comprehend. Comparing the mean supply of the four years prior to 1874 with 1876, when intermittent service had entirely ceased and a constant service under increased pressure has taken its place, we find that in 1876 the loss by leakage had already been so far moderated that a supply was given for metered trade purposes increased by 25 per cent., and unrestricted for domestic and all other purposes to a population already increased by 33,000 persons, with 12 per cent. less water than in the previous period. When to this I add that the revenue went on increasing from additional water sold to new populations and to new trade consumers, who continued to be supplied from constantly-increasing savings of the water formerly lost by leakage, you will understand the otherwise inexplicable fact that without any increase in the charges for water Liverpool continued from the year 1880 up to the year 1889 to pay the interest upon the expenditure, amounting at that time to more than 1,750,000*l.*, incurred in connection with the great scheme of water-supply which was opened and brought into use in 1892, and so important had the surplus thus realised continued to be that even now, after the expenditure of 2,250,000*l.* upon the new works, the charge for domestic water-supply—nearly two-thirds of the whole—has only been increased, and that temporarily I think, by 1*½d.* in the pound, while the charge for manufacturing supplies, about one-third of the whole, has been reduced from 9*d.* to 6*d.* in the pound. Never, I believe, in the history of waterworks has a financial condition so satisfactory in all its bearings accompanied the completion of new works, the interest upon the cost of which has been defrayed entirely from the revenue of the waterworks undertaking. I make no apology for referring to financial success of this kind in an address devoted to sanitary advancement. The case of Liverpool, it may be said, must have been exceptional. A pretty large knowledge of the works of this country, and of many of those on the Continent, enables me to assert that this is not so. In many other places equally satisfactory results have been attained, and there are still many in which, with proper personal attention, similar results can be attained, but active personal attention, I would almost add enthusiasm, on the part of some one properly qualified in relation to the magnitude of the undertaking, and determined to make his work a success, is a prime necessity. To Liverpool such services have been most ably and completely rendered by Mr. Joseph Parry, the present water engineer, who from its inception took a leading part in the organisation and management of the work which has brought about the remarkable changes I have explained to you. In this, as in many other particulars, it would be difficult to over-estimate the value of Mr. Parry's services to the water estate. Of the great supply of water which Liverpool has thus so cheaply secured from the river Vyrnwy, in Montgomeryshire, there is little time to speak to you. I will therefore only observe that it is drawn from a source of the greatest possible purity, so far as organic matter of animal origin is concerned; that, as delivered to the consumer, it is free from any other impurity which can render water unwholesome, hard or unpleasant to the sight, and that it is abundant in quantity. When speaking of the means by which the sanitary and financial success which I claim for Liverpool have been attained, I stated that many other places may still be similarly benefited; the greatest of all, London, is not an exception. I shall not suggest that municipal management in matters of water supply is of necessity better than the management of trading companies, but I feel very strongly that the water supply of the Metropolis will not be placed upon a satisfactory footing until it is worked entirely in the interests of the consumers.

The history of the companies, even since the Metropolis Water Act, 1871, was passed, abundantly supports this view. After twenty-three years there are 1,250,000 persons in the Metropolis still receiving an intermittent supply. Liverpool, as a municipality, made up her mind in the matter in the beginning of July 1874, and in less than eighteen months, as I have already explained to you, the work had been accomplished with financial profit.

It does seem to me to behove us to throw our weight against a policy which would substitute for waters such as those of Loch Katrine, of Lake Vyrnwy, or of Lake Thirlmere other waters, for the supply of our great communities, the bacteriological purity of which has only been negatively determined, the constant quality of which is uncertain, and the origin of

which is impure. The day is very far distant—if, indeed, it will ever come—when pure mountain water, taken virtually from above the limits of human habitation, or drawn from perfectly safe sources underground, will be insufficient to supply the wants of this country; till then, is it wise to continue to invest our capital in, and to prolong the life of, undertakings which are dependent for their safety entirely upon the continuity and perfection of artificial processes of purification? Much has been said about "sentimental objection." The term may be one of opprobrium, or it may not, but it is certainly a very real objection. It is an objection which I do not think will be removed by any discoveries as to the wonderful efficacy of microbes, mud enwrapped in dead or living myriads, lying in a fine film over the surface of our filter beds, to prevent the passage of on-coming bacilli, and while it exists a greater question is involved.

AIR PURIFICATION IN HOSPITALS.

AT the Sanitary Congress at Liverpool, at the instance of Mr. William Henman, the question of the purification of air emitted from hospitals devoted to the treatment of infectious disease was considered. At the outset Mr. Henman insisted that the air was a chief means for the conveyance of disease, and that the evidence at command left little doubt of the presence of numerous disease spores in the atmosphere. In these circumstances, the importance of purifying the air emitted from infectious disease hospitals became evident. Discussing the means of purification by heat, he illustrated with the aid of plans and sections ventilating apparatus in operation at hospitals in Nottingham, Bradford, Blackburn, Barnsley, and other towns, all designed, though differing in details, to draw the air from the wards through furnaces, where it was exposed to a given temperature before being allowed to pass into the outer atmosphere. As the apparatus referred to were ingenious, he discussed them collectively and comparatively from four points of view—first, initial cost; second, cost of maintenance; third, effective ventilation of the buildings; and, fourth, the state of the air discharged. His conclusion was that the method was expensive. In addition to these appliances, he had, however, inspected one which had given good results at the Victoria Infirmary, Glasgow, and designed by Mr. William Key, C.E. It was a system adopted after inquiry for the large new general hospital at Birmingham. An important feature of it was the air-washing screen, which cleansed the air entering the buildings of all dirt, fog, flies, moths and a large proportion of disease germs. Bearing this in mind, he was led to believe that outgoing air might be similarly purified, and he had adopted that improvement at Birmingham. By means of the completed method the fresh air continually entering forced the vitiated air again through the cleansing screens, so that the air in the wards was kept always in a state of purity and equalised humidity. A simple contrivance was employed to keep the screens constantly charged with a weak solution of carbolic, and which was found by experiment perfectly effective in destroying the germs of disease. By finer screens and a slower current of air the results were still more complete, and the current could be regulated to any velocity by a rotary fan. In conclusion, he expressed the opinion that the destruction and entrapping of disease germs emitted from infectious hospitals would do much to banish infectious disease entirely from our coasts.

Sir T. Crawford expressed an opinion adverse to the system advocated by Mr. Henman, on the ground that no hospital ought to be built in a position where the ingoing air had to be pumped.

THE LATE GIAN BATTISTA DE ROSSI.

THE Florentine correspondent of the *Scotsman* gives the following reminiscences of the renowned archæologist:—

Three years ago I gave some account of the Senator Pietro Rosa, the excavator of the Appian Way and of the Palace of the Caesars, of which latter he remained till death the official conservator, having his residence, in fact, on the north-eastern aspect of the Palatine overlooking the Via Sacra. To-day I have to perform a similar task for a yet mightier historical "rehabilitator," the Commendatore Gian Battista de Rossi, the true "Columbus of the Catacombs," the leader of Christian archæology, if not, in the strictly scientific sense, its actual creator. For more than a year a sufferer—he had two apoplectic seizures within a brief interval of each other—he had lived in retirement at Castel Gandolfo, under the shadow of the summer palace of the Popes, a magnificent yet deserted mansion, as silent and as melancholy as the Alban Lake over which it hangs. Within the last day or two his condition had become hopeless, and on September 20, when all Rome (except the Vatican) was celebrating the twenty-fourth anniversary of the triumphal entry of the Italian troops, he died of what his

physician describes as "cardiac and intestinal paralysis." He was in his seventy-third year.

When last I saw him, in the December of 1892, at the German Archæological Institute on the Capitol, he was indeed a changed man from what he used to be in the old days when Henzen was its first secretary, and Helbig the second in command. Then he was one of the phalanx that in the library of the Institute gathered round the green table under the presidency of the German ambassador, generally sitting to the right of Henzen and facing the distinguished excavator of Pompeii, Giuseppe Fiorelli. Almost no archæological problem, however difficult, could resist the combined attack of that phalanx. Epigraphy, of which Henzen was a master, hardly superior, if at all, to De Rossi himself, or to Mommsen, who frequently took part in those encounters; excavation in all its aspects, topographical, architectural and constructive, of which Fiorelli and Lanciani were the representatives; antique fine art, in which Helbig was a practised connoisseur; the archæology of coins and gems, in which Bernabei has still no equal—such were the departments, such their heads, apt to be called upon in the discussion of the question of the day, all of them capable singly, and still more collectively, of setting it in the clearest light and forcing it to yield up its secret. Well do I remember after Lanciani's brilliant account of his excavation of the House of the Vestal Virgins, a problem started in the conversation that followed—a problem dealing with the discipline of the Vestals in cases when punishment had to be inflicted on one of their number for breach of duty. Before the conversion of Constantine to Christianity, the Emperor was still Pontifex Maximus, and as such the control of all religious orders, including the Vestals, remained in his hands. But when by that conversion the dignity of Pontifex Maximus lapsed, and with it his authority, the question arose, on whom devolved the power of exercising discipline over the Vestals? An animated discussion circled around the point, but no real light was thrown upon it till De Rossi put his finger on a passage in the letters of Symmachus, proving clearly that authority over the Virgins (who were still tolerated as a sisterhood) was vested in the Prefect of Rome. In fact, the *Præfectus Urbis* (the mayor or lord provost of the city) exercised on more than one occasion the discipline in question.

This was but an incidental example of the comprehensive reading and prompt acumen De Rossi had ever at command in researches and speculations of the highest historical import. Fortune, too, favoured the ardent votary, and enabled him to put more "discoveries" to his credit than almost any of his compeers. He was not yet thirty years of age when he made a special study of the inscriptions in the Catacombs, particularly those of the first century, and, in the course of it, settled more than one question of collateral interest. Let me cite one. Pomponio Leto, the great humanist of the fifteenth century, founded in Rome an academy for the study of the classics, and was joined by celebrities like Cardinal Platina, author of the "Lives of the Popes;" Giovanni Antonio Campano, Bishop of Teramo; Pietro Sabino, professor of epigraphy in the University of Rome; Marc Antonio Sabellico, Pietro Pallini and many others. These enthusiastic philologists, either for having adopted the names of heathen magnates or for their zeal in favour of classical philosophy and civilisation, were popularly denounced as apostates from Christianity, as adorers of false deities and as traitors to the Pope's authority, if not conspirators against his life. Thrown into the prison of Castel Saint Angelo by Paul II., they were accused of conspiring to supplant the Pontiff in favour of their chief, Pomponio Leto. Cardinal Platina defended himself and his colleagues, and Pomponio addressed the tribunal in a memorable speech, the original of which is preserved according to Lanciani in the Vatican. Positive evidence was lacking to incriminate them, and this, aided by the intercession of powerful friends, secured their release and the rehabilitation of the Academy. How lucky they were would never have been known but for a discovery made by De Rossi in the Catacombs of St. Callixtus on May 12, 1852. In a "cubiculum" (dormitory) in the remotest recess of that subterranean labyrinth he came upon the spot where Pomponio and his confederates assembled in secret. "On the white plaster of the ceiling," writes Lanciani, "the following inscription had been written with the smoke of a tallow candle:—January 16, 1475. Pantagathus, Mammeius, Papyrius, Minicius, Ærailius, Minucius, all of them admirers and investigators of antiquities and the delight of the Roman dissolute women, have met here under the reign of Pomponius, Supreme Pontiff." Whether meant in burlesque or in sober earnest, that inscription if it had been known to Paul II. and his tribunal, would have cost those distinguished humanists their necks.

Time would fail me even to catalogue the treasure-trove De Rossi has added to the history of Christianity and of its religious development in Rome. I need but allude to his epoch-making "Inscriptiones Christianæ Urbis Romæ septimo Seculo antiquiores" (Rome, 1857); his "Roma Sotterranea" (1864-77), a mine of lore reproduced in French and English;

his "Musaici Cristiani," from the basilicas of Rome (1872-85, parts 1-14), to say nothing of his contributions to the periodical founded by himself in 1863—the "Bollettino di Archeologia Cristiana." A list of his collected works was compiled on the occasion of his jubilee in 1882, and published in the "Albo dei Sottoscrittori per la Medaglia d'Oro in onore del Commendatore G. B. de Rossi." Those subscribers included nearly every name of note in the study of classical and Christian antiquities throughout the world, and the presentation of the medal itself, which took place in the Lateran, was one of the most impressive scenes ever witnessed in the Eternal City. One memorable piece of work in which he was engaged must not be passed over—his collaboration with Mommsen in the "Corpus Universale Inscriptionum Latinarum," published at Berlin.

He had the rare distinction of being equally welcome and beloved in Pontifical and in Young Italian circles. He was not only, as I have mentioned, one of the "Dii Majorum Gentium" of the German Archæological Institute in Rome, but also of that very exclusive body, the "Pontificia Accademia di Archeologia." His work in the Vatican library was as unique and valuable as his communications to the "Atti," or transactions of German, Austrian, or French antiquarian societies, of nearly all of which he was a corresponding member. He was a devoted adherent of the Holy See, and, like his great countryman Manzoni, laboured in its defence, though from the antiquarian rather than the polemical side. Highly esteemed at the Quirinal, it was not in King Humbert's power to confer on him the honour bestowed on Rosa—that of Senator in the Italian Legislature. I am not sure whether it was not offered to him, but if it were loyalty to his Pontifical master must have made him decline it. As his presence was striking, so his disposition was singularly lovable and engaging—always placing his unique stores at the service of students, and never more happy than when accompanying a party of scholars of the most diverse nationalities over the basilicas or through the Catacombs in and around the Eternal City.

THE ISLE OF MAN.

THE members of the Cumberland and Westmorland Archæological and Antiquarian Society last week went on an excursion to the Isle of Man. The party, numbering nearly fifty members of the Society and friends, says the *Carlisle Journal*, left Barrow shortly before two o'clock on Monday, and had a delightful passage across the Irish Sea in bright sunshine until nearing the Manx coast, when the voyagers began to recall the local legend that the magician Mannanin kept the island to himself by concealing it from the sea under a cloud of mist. The beautiful Bay of Douglas was much admired. The party was landed at the Victoria Pier at about a quarter to six. They were met and cordially welcomed by his Honour Deemster Gill, Mr. P. M. C. Kermodé, F.S.A., honorary secretary to the Isle of Man Natural History and Antiquarian Society, the Rev. S. A. P. Kermodé, vicar of Onchan, and others interested in archæological and antiquarian studies.

The Society's headquarters in the island were at the Castle Mona Hotel, an imposing building which stands in the centre of the crescent of Douglas Bay, and was formerly the residence of the Dukes of Athole, "Lords of Man," by whom it was built at a cost of 40,000*l.* After dinner a meeting was held at which papers were read, new members were elected and general business of the Society was transacted. The following papers were on the agenda of the week:—"Chap-books," by the president, Mr. Chancellor Ferguson; "Church Bells of Leath Ward, No. 4," by the Rev. H. Whitehead; "Cumberland Registers, No. 1, Eskdale Ward," by the Rev. H. Whitehead; "Roman Tiles found in Carlisle," by the President; "Roman Figure from Old Carlisle," by the President, and "Some Manx Names in Cumbria," by Mr. W. G. Collingwood. The President's paper was founded upon the remarkably fine collection of about 200 "chap-books" which form part of the Jackson Library in Tullie House. More than half of these books having been printed in Carlisle or other towns in the county, the Chancellor took the opportunity of introducing into his long and exhaustive paper some information which he had collected about the early history of printing in Cumberland. Some of the chap-books—little stitched brochures which pedlars hawked about the country—were printed between 1770 and 1800. About fifteen of the Tullie House collection were printed by the Jollies, the founders of the *Carlisle Journal*, towards the end of last century; but Ann Bell, of Penrith, was the printer of the largest number, about forty of them having issued from her press. Soulbey, of Penrith, also produced about fifteen, and the other local printers included Hetherington of Wigton, Dunne of Whitehaven, Harrop of Alston, Allison of Penrith and others. Chancellor Ferguson's paper was of considerable importance, and Mr. W. G. Collingwood's paper on Manx names in Cumbria was of much archæological interest. Both will be

published in due course in the Transactions. The Roman figure from Old Carlisle exhibited was that silver ornament which was described lately in the Journal.

The antiquarians were astir early on Tuesday morning, and the weather being bright and fine the bay and its surroundings were seen to great advantage. The day's explorations lay in the southern district of the island, and onward as far as Port St. Mary. By nine o'clock the party was *en route*. The first halt was made at Oatlands, in Santon parish, to view an old sepulchral mound. At Ballasalla the ruins of Rushen Abbey were inspected, at Malew some old church furniture, and at Castletown, under the guidance of Her Majesty's Attorney-General in the Island, the party roamed over Castle Rushen. This castle is one of great strength, and is of Edwardian or Concentric style. The rooms occupied by the Derby family were inspected with great interest, as also the museum, where several crosses and other ancient monuments were shown. At Ballaqueeney, near Port St. Mary, two fine ogham stones, the property of Mr. Henry Kelly, were shown to the antiquarian party. They were discovered in a sepulchral mound close by, where, as shown by excavations, both Christian and Pagan interments had been made. The excursionists returned to Douglas in the evening, calling on the way at Arbory Church. Every facility, it should be stated, had been afforded to them to prosecute their researches. The Lieutenant-Governor of the island, Sir Joseph West Ridgeway, had placed Peel Castle, Castle Rushen and other places of antiquarian interest in the custody of the insular Government at the disposal of the Society, who had also been cordially invited to inspect antiquities controlled by private individuals.

Fine weather again favoured the party on Wednesday. Having explored the south on Tuesday, the field chosen for the second day's investigations was in the western district. The visitors left Douglas in good time in the morning under most agreeable circumstances. The air was clear and the sunshine bright. They drove first to Braddan Churchyard, which was inspected under the guidance of the Rev. W. S. Calverley, F.S.A. Some runic crosses and other monuments of antiquity were examined with much interest. The next stage was the Tynwald Hill, on which the Manx Legislature yet annually assembles, as it did nine centuries ago in King Orry's days, for the promulgation *viva voce* of the laws passed during the year. "Tynwald Day," says Mr. Hall Caine, "is more to the Manxman than Independence Day to the American. Not only is it the sign manual of his liberty; it is the story of his people. Tynwald Day is a witness to the Manxman's descent from his Norse ancestors." Tynwald Day is Old Midsummer Day, the fifth of July by the present calendar. On Tynwald Hill the Manxmen gather in thousands, and the ancient ceremonial of reading the titles of the new laws in English and then reciting the same titles in Manx is gone through. Mr. Hall Caine, who was present at this promulgation of laws on Tynwald Day last year, found that the scene had not been well stage-managed. "Nevertheless," he adds, "I should be sorry to see the old custom of Tynwald abandoned. Some day some Manxman may have it in him to breathe life into those dry bones. Meantime the Open-air Parliament of Man is unique if not overpowering, and beautiful if not solemn and stirring." As the antiquarians were viewing the scene of these quaint and curious ceremonials Deemster Gill favoured them with an interesting exposition of Manx government generally, and the Tynwald Hill legislative assemblage in particular. The party afterwards drove to Peel Castle, which stands on the extreme western coast of the island, and was the scene of part of Sir Walter Scott's "Peveril of the Peak." This fortress stands upon a bold rocky headland upon which a Norwegian ship, the *St. George*, was wrecked some four or five years ago, when the Peel lifeboat crew, commanded by their famous coxswain, "Charlie," performed prodigies of gallantry. The picturesque ruins of Peel Castle and Cathedral were also explored on Wednesday, and proceeding to Kirk Michael the party viewed in the churchyard some fine crosses, which were explained by Mr. Kermodé. Of course the tomb of Bishop Wilson was not overlooked. The party returned to Douglas through the beautiful pass of Glen Helen—otherwise Rhenass. Mr. Hall Caine, who must still be quoted as the chosen exponent of the beauties of Manxland and of the history, the manners and customs of its people, regards as the peculiar feature and special charm of the landscape of the Isle of Man, "its narrow, winding, sinuous, dark and slumberous glens." Glen Helen is not the largest of these, but it is one of the most picturesque, and the archaeologists, after spending so many hours of the day in contemplating the past, found it very delightful on their return towards Douglas to admire the natural beauties which lay spread around them.

On the day following the route of the explorers lay northwards to Ramsey, by way of Kirk Onchan, where there were more crosses to be inspected, and through the beautiful Sulby Glen, which Mr. Hall Caine has invested with fresh interest by laying there the scene of his latest clever novel "The Manxman," and peopling it with those life-like creations of his

fancy, Pete and Philip and Kate. At Ramsey the exhibits included a chalice from Jurby, casts from several crosses, and neolithic remains. In the afternoon the course of the excursionists lay by way of Kirk Maughold and the famous Laxey, by the grave of King Orry and Cloven Stones, and so back to Douglas, where the programme was concluded and preparations made for returning home next day.

SPECIFICATION WRITING.

(Concluded from last week.)

Tinner.—(Refer to General Clauses.)

Roofing.—Flat joint? standing groove? cleated? tinned nails. Quality of tin, branded? IC? IX? painted? what kind of paint? paper under, what quality and make, trade thickness. Flashings: continuous, width; broken? sizes, around chimneys, nailed? bonneted? Around skylights, carried up under galvanised iron or under sashes, if wood. Trap-doors, up rim, tacked to top edge, over scuttle down sides of rim. Gutter-strips: Twenty-inch tin, same quality as roof, brought once over edge of strip, tacked, paper under, same as roofing. Cut for rain-conductors. Eaves-troughs: quality tin? bead-edges? hung level? hung with grade? kind of hangers. Rain-conductors: kind, size, quality, trade thickness, connect with gutters, wire-balls; do conductors connect with terra-cotta pipe or discharge on ground? proper shoes.

Heat-boxes.—Quality tin, bright tin, cleated, stayed, sizes, collars for registers, for heater-pipes, for radiator-boxes, asbestos paper around studs, wire-lathing over boxes, dampers, boxes double?

Registers.—Does tinner supply or does plasterer or heater-contractor? kind, sizes.

Tin Shingles.—Any particular make? painted two coats when on.

Plasterer.—(Refer to General Clauses.)

Lathing.—White pine? spruce? hemlock? free from bark, sap. Wire-lathing?—stiffened? Other lathings: dovetail iron? expanded metal? Are outside walls stripped? Wire-lathing over heat-boxes, or does tinner do this?

Mortar.—Lime, any make? Sand, for brown coat? bar? road? creek? bank? screening? Hair, cow's hair, fresh. Run mortar two weeks before using.

Kind of Plastering.—Two coat? slip coat? three coat? with scratch coat, brown coat and finish coat? white coat? white sand. Sand float? white sand? Lath and brown coat cellar ceiling. Plastering free from cracks, blisters, wind, marks of float. Must stop, or is heat provided in cold weather? Who provides heat? does plasterer set registers? crocks for stove-pipes with caps and setting.

Ornamental Plastering.—Cornices—enriched? centre-pieces? panels? moulded? enriched? coved ceilings? Arches or arch moulds? soffits?

Patent Plasters.—What kind? make? guarantee.

Fire-protection.—Over beams, over columns, woodwork, what kind?

Galvanised Iron.—(Refer to General Clauses.)

Cornices, crestings, finials. Weight of iron or No. gauge; painted before setting inside and outside. What paint?

Skylights.—Hyatt's patent? ventilating? condensing? glass? does painter supply? ventilators, attachments for handling, rods, levers, cams, shafts, cog-connections. Show shapes on drawings; flat? pitched one way? hipped? gabled?

Roofer.—(Refer to General Clauses.)

Tin roof, under "Tinner."

Slate.—Quality, quarry, sizes, colour, grade, weathering. Tinned-nails, two to each slate, double at eaves, blind hips and ridges, cemented? snow-guards?—wire, at each joint, or other form of guard?

Tiles.—Kind, quality, bedded in hair-mortar? copper nails? copper wire? pattern, shapes, colour. Any conical roofs? special tiles. Tile-crestings, hip-rolls.

Tin Shingles.—Make. See "Tinner."

Iron-worker.—(Refer to General Clauses.)

Stirrups, joist-sockets, bolts, rods, washers, shoes for trusses, upset ends, anchor rods and plates, straining-rods, bearing bars for openings. Iron carpet-strips, iron-bricks for screwing on to. Manhole rims and caps, cellar-gratings, window-bars, grilles, painted; patent process? Store-gratings, galvanised? with hasps? padlocks? Pavement hoist doors, cellarway doors, with glass? brass-hinges? Archimedean-lifts for cellar-doors? Iron-stairs:—rails, posts, iron-treads, risers, rubber-tops? marble or slate treads and risers? in cut stone? Steel-beams:—lengths, widths, weight, angle-plates, connections, bolts, rivets, for floors, to have bearing-plates, painted before setting. Columns, cast:—thickness, bore for test, planed tops, bottoms, caps, bases—loose? drilled for bolts. Columns, wrought:—kind, make, length, required strength. Brackets, struts, wrought? cast? for bolts? cornice-rods. Clean-out

doors. Ash-pit doors. Fireproof doors, vault-doors, no burglar-proof—give all dimensions, thicknesses, fastening. Iron-shutters:—lugs for hinges? built-in? open from inside? open from outside? Wrought window-frames? sash? sills outside? heads outside? Iron-trusses refer to details, separate specifications. For trusses, contractor submit drawings. Chimney-stack cap—cast-iron? wrought-iron? bolted? Expansion-bolts. Fire-escapes? Iron-gates, railings. Harness-hooks. Feed-boxes, steel-wrought? cast-iron? Iron-mangers: cast? wrought? Water-troughs: This specified elsewhere. Stall-guards: wire galvanised? cast-iron? wrought-iron? Heavy-wrought strap-hinges, special?

Painter, Glazier.—(Refer to General Clauses.)

Old Work.—Burn off? wash off? sandpaper? Putty-stopping nail holes, cracks. Shellac-stopping knots, sap.

Painting.—To sandpaper woodwork. Priming. Three coats paint. How many colours tints? What kind of paint: mixed or ground? what lead? any zinc? what colours? any make? all paint to have white-lead body? any ready-mixed paints? what make? Ironwork painted? how many coats? China gloss-painting? how many coats? Enamel-paints: on tub? on walls? Paint to be gloss finish? paint to be dull finish? painter to protect floors, stonework, &c., while painting.

Natural-wood.—Varnish: any particular make? how many coats? Rub each coat. Finish: full gloss? dull polish? egg-shell finish? floors varnished? or wax finished? Stained: what colour? Putty-stopping, coloured to match wood. Shingles stained: what make of stain? what colour and number? Porch floors painted? Porch ceilings painted or varnished? Walls or ceilings painted? sized? how many coats? colours?

Glazing.—Any floor-lights? rough-plate? how thick? Any skylight glass? rough-plate? how thick? In galvanised-iron specification? Plate-glass, specify windows, American? French? American cylinder-glass, double strength, what grade? single strength. Chances crystal sheet? French crystal? Ground-glass? Obscured glass? Glazed doors—specify. Inside windows. Stained-glass? leaded? specify price per foot? omit? lump sum?

Heater.—(Refer to General Clauses.)

Hot-air.—Name make of heater? bricked in? who does it? Portable? Specify size, or make contractor guarantee and leave size to him. Cold-air duct: brick? wood? terra-cotta pipe? from separate opening? if so, see that it shows on plan: from cellar-window? see that carpenter boxes in and sets sash. Does carpenter make box? Bright tin-pipes to flues: size, or leave to contractor if he guarantees. Dampers. Registers: if not, where, tin-flues? if not, who? If contractor guarantees, have flue sizes approved by him. Heater should have shaking-grate, Merston or approved, automatic-damper, water-tank. All wrought-steel? All cast-iron? no combination. Galvanised iron smoke-pipe, give thickness in trade term.

Hot-air and Steam Combined.—Name make. All other specification like hot-air, for hot-air, and steam for steam. Galvanised smoke-pipe, give thickness trade term.

Steam.—Name heater, or contractor guarantee. Cast-iron sectional? wrought-iron? bricked in or not? Automatic-damper, shaking-grate, safety-valve, steam-gauge, water-gauges. Blow-off cock, into cellar? into well? not permitted in sewer. Direct? what make of radiator? automatic air-valves nickel? wood-handle nickel-plated valves? Jenkins Bros.? nickel bushings in floors. Radiators bronzed? painted? pipes bronzed? painted? Direct-indirect? same specification as direct, but specify, radiator to be box-radiator, or "direct-indirect"—and specify, galvanised casings to outside air, through walls, provide gratings, or from cellar on first floor. If from cellar, provide cold-air ducts from cellar window, galvanised iron, say twenty-two gauge. Indirect: name radiator; air-valves automatic, brass-seat valves? Jenkins Bros.? radiators hung from joists? on proper irons? Cold-air supply: galvanised iron, name thickness, flat-ducts, curved angles, duct to open through wall; if so, see that opening is shown on plan. Radiator-boxes, same galvanised iron, put together with bolts or pins, to come down, roofs of boxes, pine, tin-covered. Does contractor provide flues? registers? or are they in other trades? if so, what trades? Guarantee invariable. Written, sealed, to 70 deg. in zero weather—also against water-hammer in pipes, not over ten pounds of steam to be necessary to heat. Or does contractor provide specifications with bid under same guarantee. Any hot-water heaters? coil? Large plants, with extended work, fans, pressure or exhaust, special expert specifications. Steam-heat from power-boilers, reducing-valves, to heat system, return-pipes to tank and pumps. Power-boilers: horizontal? tubular? upright? steel? Harrison safety? Babcock & Wilcox, safety? All to be tested to carry one hundred pounds, special work more. Boiler Insurance Company's certificate to be delivered to owner. Engines: take specifications and guarantee from bidders. Refer to experts.

Electrical Work.—(Refer to General Clauses.)

Special Specifications.—Refer to Underwriters' Association. Make contracts subject to inspection approval of Association and observance of all rules of Insurance Company.

Dynamos.—Special specification. Call-bells, annunciators, buttons, pulls, batteries, wire insulated, run in tin tubes. Kind of buttons, as to finish. Pull at front door to match furniture. Annunciator to have names of rooms, &c. Hotel annunciator: take maker's specification.

Lifts.—Hydraulic? electric? direct steam? city water pressure hydraulic? name maker; Ellithorpe safety-cushion other safety-brakes? Does contractor furnish car? Own design? Your design? Gas to car? electricity to car? annunciator and buttons. Does contractor furnish? Electric-stop and start, safety? method of control, rope? winch? lever? guides, wood? iron? machinery, take maker's specification. Refer to expert. Guarantee to cover speed and durability. Require insurance and inspection from insurance company.

Hand-hoists.—Require specifications from makers. Guides at back? at all corners? at two corners? friction and ratchet safety-brakes, hatch-way doors? automatic bars? brake and rope through storeys.

Carriage-hoists.—Same. Friction automatic safety-brakes, brake and rope on band wheel.

Pavement-hoists.—Take maker's specifications, generally winch-hoists, chain-cables.

GENERAL.

Mr. Henry Hartley, president, will deliver the opening address at the meeting of the Liverpool Architectural Society on Monday, the 8th inst. Mr. F. M. Simpson, professor of architecture, Liverpool University, will subsequently give an address.

The Practice of Mr. Grierson, architect, of Bangor, whose decease we lately recorded, has been obtained by Mr. Frank Bellis, of Mold. Mr. Bellis was for eight years with Messrs. Douglas & Fordham, architects, Chester, as pupil and assistant.

The Roll of the Institution of Civil Engineers, corrected to September 6, 1894, shows that there were then on the books 19 honorary members, 1,837 members, 3,597 Associate members and 358 Associates, altogether 5,811. There is also a class of students attached to the Institution, but not forming part of the Corporation, which now numbers 782.

Mr. P. Shearson Gregory, architect, Bangor, and diocesan surveyor, has been engaged by Sir R. W. Bulkeley as architect for the Baron Hill Estates.

Mr. J. S. Sargent has completed portraits of Mr. Coventry Patmore, the poet, and Mrs. Wilfrid Meynell, the poetess.

Archdeacon Farrar gave a lecture in Rome on Monday evening on "The Development of Christian Art."

M. A. M. Castel, landowner in the Seine-et-Marne district, has, it is stated, discovered on his estate at Esmans traces of the Roman road from Sens to Lutetia.

The Vicar of Cardiff, it is stated, is asking for money to help forward the excavation of a Roman villa built over the remains of prehistoric dwellings in the neighbourhood.

The Burlington Fine Arts Club propose holding an exhibition of Egyptian art and antiquities in the spring of next year. The committee of arrangement has been promised contributions by well-known collectors, but there are many persons possessing collections or single objects of interest who may not be personally known to the members of the committee. The committee would doubtless be happy to receive any communication relating to such collections or objects from their possessors.

Professor Banister Fletcher, F.R.I.B.A., is actively engaged in preparing a complete abstract of the new "London Building Act," and it will shortly be published by Mr. Batsford.

Mr. G. C. Vernon Inkpen has been instructed to prepare designs for a new laundry for the Portsea Island Board of Guardians.

Mr. Harold Busbridge, A.R.C.S., of the Metropolitan Drawing Classes, who was last year elected a member of the Sanitary Institute, has been appointed principal lecturer in building construction, carpentry and joinery and brickwork and masonry at the Goldsmiths' Company's Technical and Recreative Institute, New Cross, under the direction of Mr. W. J. Lineham, M.I.M.E. Special classes for elementary, advanced and honours building construction will be held during the current session, and practical workshop instruction in brick cutting by Mr. W. J. Goodwin, carpentry by Mr. G. Allworth, and plumbing by Messrs. J. W. Hart and D. Early, R.P.C., will also be given. Artisans and apprentices are admitted to these classes at half the usual fees.

The Architect.

THE WEEK.

FROM his numerous and generally successful efforts to reconcile differences between capital and labour, Sir RUPERT KETTLE made the country his debtor. His name would suggest he was of Anglo-Saxon race, but he was of a French family, a descendant of one QUETEL, or QUESTEL, who fled from Meaux after the Revocation of Nantes, and set up glass-staining in Wolverhampton. There the late Sir RUPERT was born in 1817; he was educated in the local grammar school and apprenticed to a local solicitor. But like the present Lord Chief Justice and other eminent lawyers he was attracted to the Bar, and after his call in 1845 he obtained a valuable practice at quarter sessions. In 1859 he was appointed judge of the Worcestershire County Courts. Afterwards he was elected chairman of the Court of Quarter Sessions for Staffordshire. He held many local posts. Sir RUPERT'S experience in the Midlands, his acquaintance with the various industries, and his reputation as an upright judge made him an ideal arbitrator between employers and employed. His first success was gained in 1865, when he settled a difference between the builders of Wolverhampton and the carpenters and joiners. He drew up a code of rules which both sides accepted. Afterwards there was a dispute about the meaning of a clause by which extra payment was to be allowed for working on unprotected buildings in winter, and his interpretation of it in the men's favour was at once accepted by the masters. On other occasions he was called on to arbitrate in the building trades of Wolverhampton, and the gratitude of the parties was expressed in two illuminated addresses which were presented to him. Many industries invoked the exercise of his judicial impartiality, and as a peacemaker in industrial troubles his value was priceless. His unbought equity must have prevented the loss of millions of money in obviating or shortening industrial commotions. He helped to form conciliation and arbitration boards which have rendered many services to the State, although we suppose modern trades unionism would look on them as obsolete. He received his knighthood in 1886, and the honour was never more worthily earned by a civilian. It is to be regretted we have not more men of Sir RUPERT KETTLE'S character, who devote their lives to most difficult tasks for the public welfare without assuming any of the airs of the professional philanthropist.

THAT architecture is better appreciated in Liverpool than formerly is evident not only from the arrangements for the architectural professorship, but from the collection of books relating to the art which has been acquired from time to time for use in the public library. There are already upwards of a thousand books (exclusive of those relating to construction), but the number is no test. Many most costly works are to be found among them. Their excellence is due in no small measure to the extensive knowledge of the subject possessed by the late chairman of the committee, Sir JAMES A. PICTON. A catalogue of them has been issued in order that the students of the newly-founded architectural school may at once be made acquainted with the books at their disposal and reap the full advantages which such literary wealth confers. The books in the library on interior decoration of buildings (including mural and ceiling paintings, stained-glass windows, mosaic pavements, &c.) are reserved for a later list dealing with the decorative arts in general. The topographical and antiquarian books possessed by the library also contain many views of buildings.

ANOTHER architect has been made to feel the precariousness of public offices in America. Mr. JEREMIAH O'ROURKE held the appointment of supervising architect over all Government buildings, and judging by his action when dealing with the unofficial architects who were eager to compete for public buildings, it might be considered as if his loyalty to the State overcame *esprit de corps*. On

September 17, Mr. O'ROURKE was amazed, as he well might be, when he received from the Secretary of State a request for his resignation. He at once wrote back, recalling a promise that if accusations were made against him (as was the case with many of his predecessors) he was to be heard. He solicited the performance of the promise. Mr. O'ROURKE, in his letter about his office, said:—"I know that I have made enemies in my endeavour to raise it to a higher plane of professional tone and integrity than it has hitherto occupied in the Treasury Department. I am well aware of the dishonest, untruthful and bigoted conspiracy which has persistently worked against me for months past, and I should have exposed its machinations to you had I the slightest idea it would influence your judgment or your action." The Secretary in reply said his action was not due to accusations, but to his own observation of the want of system and harmony in the architect's office. Mr. O'ROURKE was accordingly bound to resign. He claimed to be one of the comparatively few educated and trained architects in the States, and therefore should be competent to understand office routine. But he says that some of his subordinates who were not architects, and have had little contact with the purely business incidents of an architect's office, considered they were better able to judge than himself, and it is to their complaints and criticisms he ascribes the alleged want of system and harmony. The unofficial architects will of course believe that NEMESIS has been pursuing Mr. JEREMIAH O'ROURKE.

WHEN the tenders were sent in for the reconstruction of Glasgow Bridge, it was found that if foreign stone were used instead of Scottish granite, there would be a large saving. In consequence of the outcry which followed no action was taken. Once more tenders are invited for the work. As some compensation to the contractors whose tendering was fruitless, it has been decided that if they will again try for the work, copies of the quantities will be supplied to them gratuitously.

SOME members of the Ipswich Board of Guardians have been visiting various workhouses with the view of collecting data to enable the Guardians to decide upon the accommodation, &c. to be provided in the new workhouse which is to be built near the junction of the Woodbridge and Spring Roads. They consider that for a small workhouse suitable to the requirements of Ipswich, the system in vogue twenty years ago was on the whole more satisfactory, but as to the infirmary accommodation they believe it would be better to base their decision on the more modern models. The committee considered it was important that the architect entrusted with the preparation of plans should possess special knowledge of this class of work. To this suggestion one of the Guardians on Friday last took exception, as he considered it was unfair to the Ipswich architects, among whom were plenty of men of ability, and capable of carrying out a scheme like the one in question. Other Guardians said they were not to be influenced by false sentiment, especially as the Local Government Board believed that special knowledge was necessary to the successful accomplishment of such a work. The report was received, together with the committee's suggestion about obtaining a specialist as the architect, only two members opposing the resolution.

A COMMUNICATION from M. HOMOLLE, the director of the French School at Athens, respecting the second hymn to APOLLO which was found at Delphi, was read at the last meeting of the French Academy of Inscriptions. He attaches the greatest importance to the discovery, as the marble slab furnishes not only the melody for the singers, but an accompaniment as well. The relation between the vocal and instrumental parts has yet to be determined, and M. HOMOLLE anticipates that he will be able to do so, as the engraving is in a fairly perfect condition. There is accordingly a possibility of settling the old controversy about the skill of the Greeks in harmony. The hymn does not appear to belong to the most advanced period of Greek art, for it is supposed to date from about two centuries before our era; but whatever its age, there can be no question it is of more importance than the first hymn to the god.

THE AMALGAMATION OF LONDON.

THERE are few men who are compelled through their own interests to be more attentive to the government of a city than architects. Amenities and administration are closely connected, for where the latter is weak the streets are not likely to be of a character which will aid in enhancing the appearance of buildings. No apology is therefore needed for treating the report of the Royal Commission on the amalgamation of the City and the County of London in columns which are usually occupied with subjects that are specifically technical.

The report seems to us in the first place to be almost unique in its character. In documents of the kind which propose changes of an infinitely less revolutionary character, reasons are given to explain the urgency and the justice of the contemplated action. But in the report that sort of treatment is not considered necessary. A foreigner who would be curious to know what was done by the citizens of London to deserve the punishment of a loss of their ancient privileges, will discover that the pages of the report furnish him with no information. The Royal Commissioners appear to be as much in the dark on the subject as any of the members of the Corporation. All they can say is "That such an amalgamation is desirable if it is practicable we understand to be assumed in the terms of the reference to us." And as if there was no obligation on them or anybody else to inquire why, after so many centuries of existence, the City should not meekly submit to annihilation, they express surprise because its representative on the Commission was curious about the defects in the government of the City which could only be remedied by amalgamation. This assumption, they say, "did not command the assent of our late colleague, Mr. H. HOMEWOOD CRAWFORD, the City solicitor, and he and those who represented the City before us as witnesses protested against their appearance on or before the Commission being regarded as an admission that the amalgamation was desirable. Ultimately the witnesses withdrew, and Mr. CRAWFORD himself retired from the Commission." As far as we can see there was no other course open to them. A comedy which was to exceed the ancient performances of the Jedburgh justices in its absurdity was about to be enacted, and the accused could not be expected to acquiesce in procedure which would not be tolerated in any magistrates' court.

For it cannot be too clearly remembered that in the present case everything depends on allegations being taken for granted without proof. There is not a jot of evidence to show that the inhabitants of London are discontented with their lot, or that their privileges are upheld by encroachments on the rights of their neighbours in the surrounding Metropolis. The Commissioners admit that of all the old customs of the City, those alone which have any importance appear to be the "market overt" and "foreign attachment." The latter, they say, "is practically obsolete, as a recent decision of the House of Lords has rendered it necessary to observe the custom in the letter, and modern conditions of commerce make it almost impossible to do this." Whether the custom of market overt should cease, or be extended throughout the proposed amalgamated city, the Commissioners cannot determine, a sufficient proof it is not the chief source of profit in Cheapside or Lombard Street. It is also said that the possession of market rights and powers as to foreign cattle and the port sanitary authority affect the whole administrative county of London, but the Commissioners do not venture to say the consequences are injurious in the Metropolis or its suburbs. The Commissioners must know the weakness of conclusions which are not supported by valid evidence, and, if it were possible, they would at least allude to the abuses of which London was the cause, if any were to be found. Their references to foreign attachment and market overt make it plain that the Metropolis does not suffer much evil from the City. Indeed, we might say that if the project of amalgamation had to depend on the testimony of inhabitants of the inner or outer parts of the Metropolis who have in any way suffered from the dual government, it would quickly vanish. It may, therefore, be admitted that at the present time the interests of any inhabitant who is under the charge of the London County Council is as little affected in any way that is damaging to

his worldly concerns by the Lord Mayor, Aldermen, Council and Liverymen of the City as by the bewildered authorities of Pekin.

Let us take another view of the case. Everybody knows that at one time the construction of great thoroughfares connecting the extremities of the Metropolis did not find much favour. Many of the roads were laid down in the direction of the City, as if the Bank were the central point aimed at, but the continuity was broken when the boundaries of the City were reached. One reason was that, the area which the Corporation controlled was so limited there was no space for many vast thoroughfares. That, however, may be admitted to be an inconvenience. In the same way a system of main drainage could not be complete if the eastern and western districts were kept apart by the intervention of the City, and that also holds true in respect of lighting, fire protection, utilisation of electricity, &c. For a long time, however, that sort of grievance has ceased to exist. The County Council in all operations relating to main sewers, main roads, street formation, lines of frontage, overhead wires, embankments and prevention of floods, &c., have supreme authority within the jurisdiction of the Lord Mayor. There are many architects who have desired to see the City in possession of a separate Building Act, for they were confident it would be carried out with more respect for design than was tolerated in the Metropolis, but the new Act, like its predecessor, with the exception of a few reservations that could not be avoided, has to be obeyed within the City equally with Westminster. The functions exercised by the City Council in such affairs as infant life protection, shop hours, weights and measures, storage of petroleum, coroners, testing weights and measures, are not likely to be discharged less efficiently by the officers of the Corporation than by those of the County Council.

The City has, however, one defect, inasmuch as it is an obstacle alike to those who believe in the virtues of centralisation and those who, like Mr. JOHN BURNS, believe in "the wonderful potentiality of municipal life" as an agency of socialism. In a country like ours, where parliamentary and civic governments have an uncertain duration, the permanent officials exercise an excessive if invisible influence. To their minds living beings become identified with arithmetical figures, and as it is as easy for them to deal with millions as with thousands, they naturally prefer the former, as being more impressive, and giving a truer notion of their authority. The arrangements with the City add a little to the labours of Spring Gardens, and accordingly there is an agency created which is unfavourable to the Guildhall. The County Councillors have their own grievances. In spite of the statistics, which demonstrate that the City has only a population of 38,000 and a rateable value of four millions, while the County of London outside is valued at twenty-nine millions and has a population of over 4,000,000, the world in general prefers the place which appears more insignificant on paper. Sixty years ago a body of Commissioners who were appointed to report on London were obliged to own that "they were unable to discover any circumstance justifying the distinction of the small area within the municipal boundaries from the rest, except that, in fact, it was and had long been so distinguished." The latest Commissioners appear to have arrived at a similar conclusion. But is not the fact a revelation of peculiar merit? The City could not for ages be distinguished unless there was something exceptional in its administration. London was the least picturesque of cities, yet at the time when it was described in a Paving Act as "very foul and full of pits and sloughs, very perilous and noxious as well for all the king's subjects on horseback as on foot," it was an emporium for foreign trade, and a great part of the wealth of Europe was entrusted to its warehouses. It has been accepted as representing English security, and there is no doubt that the value which is attached to England throughout the world is largely derived from a conviction of the stability of the City. Confidence is of slow growth among men, and especially among strangers. Are we wise to risk it in the case of London by acts which will persuade the world that the City owes its distinction to false pretences which have been going on for centuries, and that in reality it is merely a small district on a level with places which are

only known to the residents? We have no desire to say one word against the respectable gentlemen who form the Amalgamating Commission, but when we find them proposing a reorganisation of the police of the City in order that it may correspond with the watchmen in provincial towns, thus bringing a saving at the most of 50,000*l.* a year, it is evident they are unconscious of the conditions which have attracted so much of the world's wealth to one small spot. It sounds well in theory to say let "banks, docks, railway companies and other institutions pay for their own special police," although not so well as to say under County Council management police will not be needed within the City boundaries. People who possess wealth are not likely to trust it to a place where protection would be left to chance, or offered in as weak a condition as is proposed for the sake of economy.

But we must admit that the Commissioners do not express any faith in the success of their proposals about the police or the majority of the other subjects. As they entered on their task without any conviction of its necessity they appear to be no less indifferent about the effect of their schemes. On one point alone do they display a little confidence—it is in the amalgamation of the offices of Lord Mayor and Chairman of the County Council. "We may look," they say, "for the maintenance in the future of all the useful and many of the stately traditions of the past, and in particular the Lord Mayor may be trusted to represent before the world the great community of which he is the head with the splendour becoming his position." If that end is not attainable except by the unsettling of the City it would be better to imitate the legendary Brentford precedent and have two Lords Mayor of London. The importance attached by the Commissioners to ceremonial functions suggests that amalgamation is in their minds a woman's question rather than one of good government.

RENAISSANCE GLASS.*

ACCORDING to HEINRICH HEINE, the interior of a Mediæval cathedral resembles a hollow cross, in which all things are suggestive of martyrdoms, the red and green lights of the windows denoting the blood and pus of the sufferers. Everybody will not accept that view, although it expresses the opinion of a great genius whose life was one of suffering and who was as sensitive to religious emotions as any of his race. It suggests, however, the belief which was not confined to HEINE, that the early and best examples of painted glass were not intended merely to allow of "a dim religious light." They expressed by their peculiarities the mystery which all religious people accepted as a condition of life, and they inspired hope, as if they were means of communication between worshippers in a church and Paradise. If the æolian harp had been known to the Mediæval clergy (some people say it was invented by a Jesuit in the seventeenth century, while others believe it was employed by DAVID when a shepherd) we may be sure they would have utilised it with the same object. But one of the consequences of the law of development was that the influence of "Blutstropfen und Eiter" was to diminish. Daily executions and torturings made representations of martyrdoms appear commonplace. The world and its desires had also gained more hold on the Church. Hence it was, as HEINE maintains, that Pope LEO X. was as influential an agent in the Reformation as LUTHER himself, and the protests in stone, colour and rhyme by the Renaissance artists and poets which were inspired by the Vatican were as effective in their way as the Wittemberg theses.

The concluding volume of "The History of Design in Painted Glass," on which Mr. WESTLAKE has been engaged for nearly forty years, treats of the work of the sixteenth and seventeenth centuries, and reveals the transformation of religious thought. The symbolism of the old glass painters was no longer approved. The windows were made to resemble pictures on canvas or wood. There seemed to be little difficulty in having one's portrait set up for the sun to stream through, or, what was more satis-

factory, in posing as an ecclesiastical figure arrayed in the richest of vestments. If there was a loss in the abandonment of the Mediæval *naïveté*, there were many gains. It is impossible to say whether many Mediæval windows exemplify the full powers of the artists. The men appear sometimes to have been fettered, as it were, by the conviction that the fullest exercise of their talent would be a delight that was sinful. In the sixteenth century there was freedom, and the glass often has a magic beauty which purists and sticklers for Mediæval propriety cannot resist. Mr. WESTLAKE in treating of the subject has a more difficult task than falls on amateurs when describing Renaissance glass. As an artist he is bound to uphold principles, and cannot be indifferent to the conduct of the artists when they "introduced the fashions foreign to the purposes of the art, and by the use of adventitious and accidental aids and embellishments eventually swamped its essential character and original traditions." But he recognises the manipulative skill that is manifest in the innovations and endeavours to do justice to the offenders.

Successful painters were not above giving designs for glass painting in the sixteenth century, as well as for tapestry and other productions. The co-operation helped to break down the barriers which separated the arts of representation. One of the effects was the renunciation of many of the conventions which imparted character to the glass of the preceding period. An example may be given in Mr. WESTWOOD's words:—

The most marked characteristic of the early sixteenth-century design, in certain instances, was the gradual abandonment of canopies; the pictures or subjects were very frequently placed in the openings without any ornamental surroundings or accessory work. One may suppose that this resulted from the somewhat crude species of reasoning still often used against accessory work in the present day; such, for example, as "There is no canopy-work in nature," "Abel was not killed in a centre of canopy-work," &c. Those who use this assertive species of argument may be answered (taking an analogy from a picture exhibition) in their own method, by the assertions that "Gold frames do not occur in nature," and that "Abel was not killed in ormolu surroundings." Reasoning on matters of taste requires to be most carefully applied. We may lay at its door much of the mischief that was rife in art at this period. Even in our own day it is not innocent; and often, when applied in certain ways, it arrests that continual progress and development that successors in workmanship would achieve if left to traditional ideas. There is, however, little need of a long argument on a question of taste. It certainly improves the appearance of a building in which glass is inserted if there is some work surrounding the picture, which leads it towards and into the stone or marble-work; and if this accessorial work is sometimes similar, although the repetition be not exact in each opening, it harmonises the whole. It is the only part of the design that can be repeated, and the value of repetition in composition has been so frequently proved elsewhere that I need not burden these pages with the argument. The sixteenth century was, however, a period, especially in its later years, when traditions were disregarded and every old practice was questioned. When the pictures are small and numerous in large openings, very little accessory work is necessary to harmonise them. In subjects of larger size it appears to me to be invariably required in some quantity; but in very large windows filled with large picture-work, as in some of the latest of those at Gouda, it fails to be of any service. As both ornament and figure lose their proportion in the church, they swamp and destroy all the other art and architectural details of the building.

The last words indicate that Mr. WESTLAKE believes in the principle that all decoration of a building, whether mural painting or glass painting, mosaics, tiles, &c. should be made to appear as subservient to the architecture and expressive of its supremacy. The Renaissance decorators found the principle was less easy to accept than their successors. From their versatility they could practise all the arts, and therefore could hardly have had much preference for any one of them except what arose from financial considerations. It was hard on a man who loved painting and sculpture to make architecture more prominent, and consequently many of the Renaissance examples are dangerous to follow.

There were other departures from Mediæval ways which Mr. WESTLAKE explains. The heads were sometimes taken from comely individuals, but by a perversity, as coarse models as any Dutch painters would admire were also utilised by the glass painters. "Our Lady of Pain" was superseded, and there are examples which reveal a strange want of sympathy with everything that was not earthly. In some kinds of drapery there could not be much variation from old types which seemed to be asso-

* A History of Design in Painted Glass. By N. H. J. Westlake, F.S.A. Vol. IV. London and Oxford: James Parker & Co.

ciated with Christianity, but the robes became more ample. Nothing, however, was more subversive of tradition than the want of appreciation of outline, which was like a bequest from Egyptian art. "The artists of the period," says Mr. WESTLAKE, "generally abandoned the outline as a principle, except where it was absolutely impossible to do so, as in profile forms, in assisting shadows, or in the darker parts; and they aimed at expressing the forms by more elaborate modelling, shadowing and chiaroscuro, all of which, notwithstanding their great temporary success, were destroying at least one of the qualities of the material." The tendency to compete with the painter in oils or tempera was the cause which introduced also innovations in the handling, and an elaborateness was common which might be considered unnecessary in works that were generally at a distance which did not permit close examination. On this subject Mr. WESTLAKE offers the following excellent remarks:—

The method of manipulation appears to have been as follows:—The pigments and flux were ground exceedingly fine, then mixed in water with some slight adhesive substance, such as gum in a very small quantity. The very dark touches, such as those for eyes, eyebrows, nose shadows, the mouth, &c., were sketched in, and the glass was burnt. On being cooled it was placed on an easel, and the pigment was floated over the surface of the glass, the lights and shadows being expressed by more pigment being floated into the shadows, according to their depths; a slight dabbing or stippling was sometimes used, but more generally dispensed with. For the strongest shadows dark patchings or dark black touches were skilfully used in work intended to be placed at a distance, and they gave a good effect. The colour, when dry, was again worked upon, the high lights being heightened by a dry brush passed over them, or scratched out by a needle point. The stronger shadows were sometimes etched over again with lines, and the dark touches strengthened. It was then reburnt. In some of the later work, especially in the seventeenth century, it was still more worked upon and obscured, and some essential oil, instead of water, was mixed with the finishing pigment to keep it soft in effect. This soft or smooth shadow is more obscure than that appearing rough, as the grains of the pigment lie closer together. All the draperies and ornamental portions are painted in the same way, except that the clearing out of the lights is often done in a broader and bolder manner.

The extracts will enable our readers to realise the practical character of the information which is given in the first part of the book. Mr. WESTLAKE, as an artist, is able to understand all that was done to insure effect, and his discoveries are not treated as trade secrets.

Mr. WESTLAKE next treats of the English and continental examples, as it were, individually. His descriptions are full of detail, and with the aid of the numerous illustrations will enable the reader to realise the character of the windows and to imagine their colour effects. No pains have been spared in utilising all available means for arriving at the history of the works, and the pages will therefore be found as interesting to the archæologist as to the architect or the artist. The work has been in preparation, as we have said, for nearly forty years, and nobody will be surprised who considers the extraordinary amount of particulars which are introduced in the four volumes. The letterpress resembles one of the old windows, which might be designed by one effort of the will, but to execute it patient toil was needed in adding one small part to another, and no endeavour to imitate TINTORET in his fury or MICHEL ANGELO, when he said quick work was good work, will avail. The art of glass painting can only be described in a satisfactory way when much time as well as labour is given to the preparation of materials.

Although the sixteenth and seventeenth centuries were times of commotion in England, it is surprising how much painted glass of that date is noticed in Mr. WESTLAKE's last volume. Winchester Cathedral, Malvern Priory, York Cathedral, the Chapel of Henry VII., King's College Chapel, Cambridge (where "we see the work of the last of the great 'glaziers,' whose religious art was fostered by the clergy and patronised by the court and royalty of England"), Bury St. Edmunds, Basingstoke Chapel, the Oratory at the Vyne, near Basingstoke; St. Margaret's, Westminster; Queen's College Chapel, Oxford; Balliol College, Oxford, and St. Neot's, Cornwall, present examples which Mr. WESTLAKE maintains are English work. In addition there are buildings containing foreign glass. The most interesting examples of glass in France, Belgium, Holland, Germany, Italy and Spain, are described with no less affection and ability.

THE EXTERNAL COLOUR DECORATION OF BUILDINGS.*

AMONGST the many considerations suggested by the works of the old masters in art, there is one concerning the external decoration of houses which leads to the inquiries, Why is it that to-day when the words "old masters" are on the lips of all, when we consult and study them that we do not take examples from the various methods that they had of externally decorating their edifices with such beautiful effect? and why do not we also unite colouring with architecture? Colour does not disturb form in any way; in fact, when colour is well conceived it greatly helps to bring out the full beauty of form. The Assyrian art, the Egyptian, Greek, Roman, Arabian, Gothic, and finally, the art of the fifteenth century, entered into the decoration of innumerable edifices of great importance, some with monochrome colours and some in polychrome; whilst we, with few exceptions, when we want to do something above the ordinary level, generally resort simply to the usual terra-cotta or stone of uniform colour and to very little else.

We must, however, here note that in spite of the general similarity of the external decorations of the present age, we see in them from time to time a tendency to more closely study the old masters, and we notice a certain revival of old ideas of great artistic value relating to external decorations in colour.

There is much that could be said about the art of uniting colour with architecture in the Greek and Roman periods, but the time is too limited on this occasion to attempt to cover so extensive a field. I will, therefore, limit myself to a few remarks about the methods adopted by the fifteenth-century artists for adding beauty and variety to their edifices. I ought also to say that amongst the many and varied styles of external decoration of the different artistic periods in different countries, that used by the fifteenth-century masters, which lends itself so particularly to our requirements, greatly surpassed every other style of decoration which had up to that period been used. What have we, it may be asked, more beautiful in external decoration than the immortal majolica of the Della Robbia and the graffitos, chiaroscuros and frescoes of Polidoro da Caravaggio, Pellegrino da Bologna, Maturino Fiorentino, Giulio Romano and Raphael? These artists who possessed such refined taste covered many and many external walls of houses and palaces which for the proportions of the windows, the elegance of the columns and that of the cornices, have excited immense admiration, and yet those beautiful and various decorations, framed as it may be said by the surrounding elements of architecture, have hardly been considered worthy of study except in very rare cases.

Rome, Florence, Venice and many other principal and secondary cities of Italy can give innumerable examples of the beautiful art of external decoration, which in virtue of the material used and the mode in which the work was done, have endured through many centuries, as well as the architectural stone-work which encloses them.

However, we must note that in those golden times the term decorator conveyed something more elevated and noble than it is frequently understood to mean to-day. In fact, in the past a Michel Angelo, a Raphael, a Cellini, were embraced in the title of decorator. Whereas in these days it is rarely that we see a work of industrial art executed by an artist of high reputation, as there seems to be a prejudice against such work. Why then do we not entirely abolish this prejudice? Why do not artists who have great names and those who have not return to those good and wise traditions of the old times? What variety, what elegance of effect might be added to the many houses that are now being constructed with so much good architectural taste if there were introduced in some or all of the blank spaces decorations of majolica, graffito, chiaroscuro or fresco as in the fifteenth century?

Let us, however, now pass on to the principal methods of external decoration most used in that period, beginning with that of majolica.

Besides being extremely beautiful, the majolica decoration has the advantage of preserving the walls by preventing the penetration of moisture into the interior and thereby protecting in the same way both the owner's property and the occupiers' health. As is generally known external decoration in majolica is often seen in the southern climates, whereas in England, if used at all, it is chiefly for interiors. If we ought to believe in the old Latin saying "Utile dulci," majolica would hardly be selected for the internal decoration of dwelling-houses in cold climates, for, although in a certain sense it must be considered useful, it certainly would tend to discomfort indoors under ordinary circumstances during cold weather.

Externally, however, as already said, it protects the walls from rain, fog and dirt, presenting at the same time to the eye a magnificent and varied effect. We may imagine the effect of the front of a house well designed by the architect for the

* A paper by Cesare T. G. Formilli, read at the request of the committee of the Art Workers' Guild, London, on October 5, 1894.

application of majolica, having beautiful friezes, medallions, panels, &c., in this material and of truly artistic creation in the sober sense in which the old masters intended. A large frieze, as made by Luca, Giovanni or Andrea della Robbia, with spaces between the windows fitted with beautiful symbolical figures, representing, for example, scenes from family life, or fitted with scenes of child life, as Andrea fitted the famous medallions which decorate the space above the arches of the Hospital of the Innocents in Florence.

What beautiful and sublime external decoration is made by the five figures of Giovanni della Robbia, in Pistoia, namely, Faith, Hope, Charity, Prudence and Justice; also by the immortal frieze called "The Seven Works of Mercy," of which beautiful copies can be seen at South Kensington Museum, and which are good in any case as an inspiration in that class of external decoration. Not less important or beautiful are the medallions of the arms of the King of Anjou and the months of the year, both by Luca, and also found amongst the many treasures of the same museum.

It would be too long to enumerate the many examples of decoration in majolica by the Della Robbia family, who began with Michael, born about 1320, followed by Luca about 1399, by Andrea in 1435, and by Girolamo in 1488. Afterwards one branch of this family became almost French, and finished with Guido della Robbia, who did not reach the age of touching the clay, but died in 1625 at the age of only five years.

Another system of external decoration not less beautiful and well adapted to resist atmospheric changes is without doubt that of graffito, which was adopted with immense technical and artistic knowledge in the renaissance of Italian art.

Such decoration, whether it be for its weathering powers in severe climates or for the magnificent artistic and at the same time subdued effect which it produces to the eye, certainly merits being considered as beautiful as decoration in majolica.

On the Continent, and especially in Germany and Italy, the art of graffito is extensively used, but here in England many must regret that graffito decoration has been almost entirely neglected. It is difficult to account for this unless it is due to erroneous impressions that the English climate would injuriously affect the work, or that it may be too expensive for general application.

Regarding the cost, I need only say that it would compare favourably with any decoration, even if it were of the simplest description, in stone or terra-cotta.

As to the durability of graffito, it is, if properly executed, quite capable of resisting heat, frost and rain, because it presents a very hard surface and is much less porous than ordinary stones or bricks, whilst it lends itself to being easily washed, which is an advantage in foggy and smoky atmospheres. Of the very few examples of graffito existing in London, that which is at South Kensington, although not executed according to the method of real graffito, affords nevertheless good evidence that decorations of this character do not suffer materially from long exposure to atmospheric changes. If they are a little darker in tone than when they were executed, they still are perfectly distinct and without doubt of a finer tone and more harmonious than when done by the artist. Here I ought to add that the work just mentioned is cut much deeper than graffito as intended by the old masters in this art—masters to whom we ought to feel deeply grateful for having added this treasure to their already invaluable bequests.

Vasari wrote of the graffito of his day, and gave considerable information about it. He referred to it in words which may be translated as follows:—"Artists have another sort of art, which is called graffito, and serves for ornamenting the fronts of houses and palaces, which may be quickly decorated by such a system, and more surely resists the rain. Its durability is entirely due to the etching on the wall instead of being simply drawn in chiaroscuro or in colours." He then describes the process of preparing and tinting the cement or plaster, which is to be laid on the part of the building to be decorated, and which forms the background of the work, and explains how this is afterwards covered with a wash of lime of travertino, through which the lines are etched with an iron point. He further describes how backgrounds are obtained by the entire removal of the surface wash, and shows how strong projecting shadows for grotesque figures or designs of foliage may be produced by adding stronger shades of the same colour to the background.

Referring again to the graffitos at South Kensington they may be described as low relief in graffito rather than graffito proper, because the cut into the plaster or cement bed is excessively deep. The depth of the cut made with the iron or steel point by the artist in that particular work is a disadvantage, necessitated by plastering on the final coat instead of merely washing it on. So deep a cut gives a hard appearance to the design and impedes the water from running off the walls, whilst tending to accumulate dirt. The true Italian graffito is without this inconvenient feature, because the depth of the cut is scarcely perceptible. The cut or score made by the instrument does not generally exceed the thickness of a sheet of drawing-

paper, or in other words very little more than the thickness of the surface layer with which the bed-work is covered. Extremely beautiful effects can be produced under these conditions, perhaps more beautiful than can be obtained with a soft pencil on a rough paper. The weight of the leaning point of iron is itself sufficient to remove the light surface, and to make the dark background appear without fatigue to the hand.

In some backgrounds colours in monochrome are sometimes added and these are treated just as you treat fresco, which is very easy after experience has taught the difference between the tint in its wet and dry state. Some of the richest and finest effects are reached by the addition of gilding to some part of the graffito, as ribbons, fruits, arms, &c. The gold, however, must be added when the graffito is perfectly dry.

Naturally there is much in graffito decoration that experience teaches, but it is not very difficult to execute, and it seems to be deserving of more attention in these days of progress, in virtue of its durability as well as of the excellent effects it lends itself to producing. There seems to be a good field open for teaching graffito decoration in the art schools which have been so largely established in this country.

There are still other modes of decorating the exterior of edifices which were adopted by the fifteenth-century artist, namely, that of chiaroscuro in fresco and of fresco in colours. The first has at a distance all the appearance of graffito, and, although the design is not cut, it has similar colour and effect.

Much was done in this style by Maturino Fiorentino and Polidoro da Caravaggio, both of whom arrived at the highest point in this art of decoration with their immortal work of chiaroscuro in fresco in Via della Maschera d'Oro in Rome. Many other examples could also be mentioned, but as this work is the most important amongst the others, it will suffice as an illustration of this beautiful art. The frieze representing historical scenes is the most important decoration, and in a certain sense it recalls to mind the sequence of pictures which compose the *Triumph of Caesar*, by Mantegna, at Hampton Court.

Speaking of fresco, what is meant is the real Italian fresco, and not tempera or incausto, which is occasionally confused with it. As an external decoration it may be considered to be truly ideal, and it is to be regretted that in England it appears to be absolutely out of fashion.

Outside fresco, when it is done with good and pure earth colours, upon suitable lime mixed with much sand and puzzolana of that sort which the Romans used for the Coliseum, becomes very solid, hard, lasting and washable, just like compact and durable stone.

It is really to be regretted that to-day the exterior of buildings is so much limited in the matter of decoration to frames, columns, or, in a few words, to architectural mouldings, whereas the old masters of nearly all ages introduced into their edifices all that contributed beauty. Why, it may be asked, render so poor the mother of all arts—the one which more directly speaks to our souls, which is so impressive, which cheers and covers us?

Let us then also return to the old masters for the colouring of our edifices. If we like we may return to the splendid Greek edifices, but above all let us return to that apotheosis of refined taste in this great art—the immortal, the luxurious, the sublime St. Mark's, in Venice. The creators of that monument were not only architects, painters, or sculptors, but they comprised all that is understood by the illimitable and magnificent significance of the word—Art.

That monument which speaks to the heart in a language of gold is a creation which will always remain immortal. St. Mark on this earth without colour would not be worthy, as it is, of St. Mark in heaven.

TESSERÆ.

Myron's "Discobolus."

THE "Discobolus" by Myron was one of the most celebrated works of ancient art. The original was in bronze, but there are still several ancient copies of it in marble, though not one entire—one in the Campidoglio, one in the Vatican, and a third was in the Villa Massimi at Rome. That in the British Museum was found in the Villa of Hadrian near Tivoli, in 1791, and passed into the possession of Mr. Townley through the hands of Mr. Jenkins, a well-known dealer in works of art of that time. Some other trunks of ancient statues, which have been variously restored, are also said to be marble imitations of this work of Myron. The Townley copy, according to some critics, has been incorrectly restored, and the head is said not to belong to it. In Lucian's description of the "Discobolus" of Myron the head is noticed as being turned and looking back, as it does in some other of the reputed copies of this celebrated work. It must be observed, however, that there is no proof whatever that any of these marbles are copied from the celebrated "Discobolus" of Myron. The

Abbate Fea appears to have been the first to suggest the identity, which occurred to him from the similarity between the Massimi "Discobolus" found in the Villa Palombara in 1782, and a "Discobolus" by Myron as described by Lucian, and in part by Quintilian. Quintilian (ii. 13) merely alludes to its distorted position and elaborate execution; Lucian ("Philopseudes, 18) describes it more in detail. He says:—"The 'Discobolus,' in the twisted posture with the hand reversed and one knee bent, as if about to vary his attitude and rise with his throw, his head being turned to τὴν or τὸν δισκοφόρον—the quoit-bearer," which Fea interprets by "the hand in which he has the quoit." These words are, however, sometimes rendered "the girl or boy who holds the quoit," implying that the thrower was not yet in action, having only assumed his position, turned his head back, and extended his hand to receive the quoit from the bearer in attendance, who is implied only by the attitude of the "Discobolus," not expressed. The Townley marble is, however, throwing the quoit, both knees are bent, and the toes of the left foot, on which the figure partly rests, are turned back. The action is perfectly momentary, and he is already giving the impetus to his throw. Barry preferred the forward direction of the head, as in this statue, to the turn spoken of by Lucian and seen in other statues of this subject, as much more consistent with the necessary impetus of the throw. He says:—"The position of the head, hanging down in the same direction as the body, is very remarkable in Mr. Townley's figure, as it is a deviation from the original of Myron, as described by Lucian, and consequently from the Massimi copy, which corresponds perfectly with that description. In all other respects these figures agree, and this deviation appears to have been not unwisely made, as in this way all ambiguity in the intention of the figure, by the direction of the eyes (which are not wanting in the action), is ingeniously avoided; and in finishing the action, at least an equal acceleration of impetus is produced by the head shooting upwards and forward, along with the other extremities."

The Luneborch Brass, Lübeck.

In the cathedral church at Lübeck is a noble brass to John Luneborch, "Proconsul" of Lübeck, who died in 1464. It consists of one vast surface of plate measuring about 12 feet by 6, upon which is engraved the effigy beneath a nine-foiled canopy, and the whole background filled in with rich diapering. The deceased is represented in ordinary civil costume, but with the tunic richly embroidered and guarded with fur; his head rests on a pillow; a narrow baldrick sustains an anelace and a gypcière, both on the right hip; the shoes are sharp-pointed "high-lows." Between the feet is a shield charged with three castles. The legend is marginal, with the background sunk so as to leave the letters raised, and at the angles are the evangelistic emblems; beyond the legend is a rich band of diaper. The diapering of the general background bears a strong resemblance to the Flemish brasses found in England, such as those of Lynn and Topcliffe a century earlier. The whole design is extremely artistic, and such as we may look for in vain in English work of the same nature, even at an earlier period; the head is especially noticeable as an evident portrait, designed with excellent skill. The monument affords a good illustration of one of the most curious facts in the history of monumental brasses, that whereas upon the Continent they were, from their origin throughout their whole period of use, designed with almost invariably high artistic skill, yet in this country, although infinitely more numerous, we cannot point to a single ancient example which can fairly be said to exhibit any special artistic skill, while the large majority were evidently "workman's work." In the same church are a number of very ancient linen altar cloths (not frontals), of extreme value and interest; one probably dates from the thirteenth century. There are also some good examples of ancient silver.

The Miniatori.

The illuminating of MSS. is generally considered as a connecting link between ancient and modern painting, but though at the revival of painting MSS. were illuminated by painters, the caligraphists must have been always a distinct class, and even the initial letters and borders were executed by distinct persons from those who wrote the MSS., which is evident from the fact that some MSS. want the initial letters altogether, the spaces being left to be filled in by the proper artist. Though many illuminators of MSS., or *miniatori*, at about the revival of painting became subsequently great painters, it is not likely that painters became the illuminators of MSS. at any time beyond the execution of the miniatures which were attached to them. There are few even moderately good miniatures as works of art to be found in any MSS., and the best of all are those executed by the celebrated Memling and his nearly contemporary, Giulio Clovio, a native of Croatia, who died 1578, aged eighty; executed therefore at the time when painting was at its highest state of perfection, which shows that the influence of the great works with which Flanders and Italy

then abounded reached the decoration of MSS. as well as other objects of taste, the less influenced by the greater; but the reverse was probably never the case, and it would be difficult to show that painting was ever in any way improved or even preserved by the illumination of MSS. The *miniatori* (from *minium* or *minio*, red lead; Pliny and Vitruvius sometimes mean vermillion by *minium*) are said to have been the only painters of the Middle Ages, but this is an incorrect assumption, and that the *miniatori* also were the revivers of painting in the tenth and eleventh centuries is a mere theory founded on assumption. Constantinople always had its painters, and there is a Latin work extant, of as early a date probably as the ninth century, which treats of painting in all its branches, "De Omni Scientia Artis Pingendi," not omitting painting in oil. There is a MS. of this work now in the British Museum; it is by Theophilus Presbyter, whom Lessing supposes to be the same person as Tutilo or Tuotilo, a monk and painter, "picturæ artifex," of the convent of St. Gall, in Switzerland. Vasari, in the "Life of Dom Lorenzo," informs us that the writers of letters were a distinct class after the revival of painting, for he notices Dom Jacopo, of Florence, a monk of the Convent degli Angeli, of the fourteenth century, as the most celebrated letter-writer, "scrittore di lettere grosse," not only in Tuscany, but in the whole of Europe. He left his convent sixteen folio choral books with miniature illuminations by another monk of the same convent, Dom Silvestro, and their skill was so much venerated by their brother-monks that their right hands were embalmed after their death and preserved in a tabernacle. It appears that the earliest MSS. extant of Greek and Roman origin are not much ornamented, their embellishment consisting in little more than the occasional use of red ink for titles or commencements of books. No ornaments have been found in the Herculaneum papyri. The Egyptian papyri are written in various colours; they contain mythological figures in red, blue, yellow, green and white.

Greek Mouldings.

The leading outline of Greek moulding is the gracefully flowing cyma. This will indeed be found to enter into the composition of almost everything that diverges from a right line, and even combinations of mouldings are frequently made with this tendency. It is concave above and convex below, or the reverse; and though a long and but slightly flected line connect the two ends, they will always be found to correspond; that is, the convexity and the concavity will be in exactly the same curve, so that if the moulded surface were reversed and the one made to assume the place, it would also have the appearance of the other, and the effect would be the same. It is in fact the Hogarthian line of beauty, and it is not a little singular that Hogarth, in his well-known "Analysis of Beauty," although he did not know and indeed could not have known the contours of Greek architectural mouldings, has given the principle of them, and under his line of beauty has described many of the finest Greek forms. The Roman and Italian mouldings were called Greek in his day, and he assumed them to be so, but they evidently do not agree with his theory, whereas in principle the now well-known Greek forms do most completely. The cyma-recta is generally found to be more upright and less deeply flected than the cyma-reversa; it is almost always the profile of enrichments on flat surfaces, of foliage, of the covering moulding of pediments, of the undercut or hooked mouldings in antæ caps, the overhanging not affecting the general principle; and it pervades, as we have said, flected architectural lines generally, whether horizontal or vertical. The cyma-reversa has all the variety of inflection that its opposite possesses, but the line connecting its two ends is for the most part more horizontal, and its curves are deeper. It pervades many architectural combinations, but is most singularly evinced in the composition of the Greek Doric capital, which is a perfect cyma-reversa, with the ends slightly but sharply flected, as it flows out of the shaft below, and turns it under the abacus above. The obviousness of the former is prevented by the annulets which divide the cyma into an oval and a cavetto, but the principle is clear. The cyma is the governing outline in the congeries of mouldings in bases also, as may be noticed in Ionic and Corinthian examples.

Pompeian Houses.

Although it has been ascertained that the Romans understood the manufacture of glass, or at least that they possessed some utensils of that material, it must not be supposed that they were accustomed to apply it to exclude the weather and transmit light; for in no case has a glass window of any kind been discovered in any ancient structure, and, without contemplating the houses of Pompeii, it is impossible to appreciate the advantages we derive in our habitations from the application of that beautiful production of the useful arts, and how much superior it alone renders them to those of the ancients. The floors of the houses of Pompeii and Herculaneum are all of mosaic work, coarser and simpler in the less esteemed parts, and finer and more ornate in the more finished apartments: the ornaments are borders, dots, frets, labyrinths, flowers and

sometimes figures. In this, too, the superior advantages the moderns enjoy are evident. The ancients did not understand how to construct wooden floors, at least the application of timber to that use was not made by them; for, though it were admitted, which, however, it cannot be with justice, that in the warmer climate of the south of Italy, lithic floors would be more grateful, that would not be the case in this country; and we find the remains of Roman houses, baths, &c., in England, with floors of mosaic, as in Naples and Sicily. All the indications which are found in Pompeii of an upper storey consist in a few rude and narrow staircases, which, it is very probable, were to afford access to the terraces or flat roofs, for they are not common, and no portion of an upper storey remains in any part, though the lower or ground-floor rooms, it is most likely, were arched over. In one part of the city the houses on one side of a street are on a declivity: there a commodious flight of stairs is found to lead from the atrium in front to another atrium and rooms below, not under the houses, but behind them; for neither do we find an underground or cellar storey in the Pompeian houses. On the shores of the Bay of Baïæ and of the Gulf of Gaeta, at Cicero's Formian Villa, however, there are crypts or arched chambers under the level of the mansions; for the sites require substructions; but it may be questioned whether even these were used as parts of the house and as we use cellars, for they present no indications of stairs and have no regular means of intercommunication. Neither had the houses of the Romans chimneys of any kind; their only mode of warming their apartments was by means of braziers, many specimens of which have been taken out of both Herculaneum and Pompeii; and their cooking fires were on fixed gratings over a sort of stove, but without flues; so that most probably charcoal alone was burnt for domestic purposes. In this respect the modern Italians are not far beyond their predecessors; and the mode used by them of applying fire in warming and cooking appears very similar to that used by the Romans. Indeed many of the peculiarities we have noticed in the Pompeian houses are still found in various parts of Italy and Sicily; the cortili, courts, or cloisters of palaces, mansions, monasteries and inns are representatives of the *cavædia*, vestibula, atria or courts of Pompeian or Roman mansions. It is common, too, in the former, for bedrooms to open on open galleries, as on the colonnaded courts of the latter. There are instances also in the countries referred to of rooms which have no aperture but the doorway. Shops are frequently mere cells having an opening towards the street, part of which is a door, and the other part, with a low dado, a window. It was only in the forums and public places, then, that architectural beauty and magnificence were displayed in a Roman city. Street architecture was unknown and the decoration of houses was the work of the plasterer and painter rather than of the architect.

The Royal Academy and the Georges.

George III. caused apartments for the schools to be fitted up in his own palace of Somerset House, supplied the Society with rooms in Pall Mall for their exhibitions, and for several years made up every deficiency in their expenditure from his privy purse; with true and considerate benevolence he allowed them at the same time to reserve a hundred pounds a year to form a fund for necessitous members or their widows, and twice that sum to administer occasional relief to artists in distress, whether they were members of the Society or not. The king constituted himself the head of the Academy, and showed a personal interest in its success; he gave frequent audiences to its officers, confirmed its proceedings when his sanction was necessary, and attended to all its concerns as if it were part of his household. When old Somerset House was purchased by the nation as a site for a number of public offices, the king took care to reserve a portion of the new building for his Academy. In 1776 the plans of a new site were submitted to the approval of the president and council, and the apartments devoted to this purpose were fitted up with a degree of magnificence worthy of a royal palace, the talents of many of the principal members having been employed in its decoration. In July 1780, the preparations being completed, the Royal Academy obtained possession of their new residence, by an order from the Treasury to the Surveyor-general of the Works, and their first exhibition in Somerset House took place in the following year. This friendly superintendence of its affairs and anxious desire to promote the welfare and utility of the Society continued till the year 1800, when the health of the king unfortunately became so much impaired as to prevent any further interviews between the Academy and its patron. But the institution had now acquired stability, and though its acts for some time remained unconfirmed, it continued to exercise its functions; and when the government was placed in the hands of the Prince Regent, he took the Academy under his protection and approved of their proceedings. On his accession to the throne, in 1820, the position of the Academy had become somewhat changed. A gradual augmentation in the receipts of the annual exhibitions, aided by a judicious economy,

had enabled the members to support the schools on an increased scale of expenditure, and to provide for the continuance of the establishment from its own resources, without the assistance of the king. On the death of George III. the Academy solicited his successor to honour them with the same patronage which they had received from his predecessor. George IV. readily consented to adopt the Royal Academy, and, in furtherance of the views of its founder, placed himself at the head of the institution, and thenceforward gave the sanction of his signature to such of their proceedings as required it. Though the Society did not derive any pecuniary assistance from George IV., they were on many occasions indebted to his munificent patronage. He honoured the president with a distinctive badge, a gold medal and chain, to be worn on all public occasions. He presented them with a magnificent lamp for their principal room, and greatly forwarded the utility of the schools by giving them a large and highly valuable collection of casts from the finest antiques, which were procured from Rome by the intervention of Canova.

Swanscombe Church, Kent.

Swanscombe Church, between Gravesend and Dartford, possesses much archæological interest. It has a handsome broached steeple and a tower containing a perfect example of a Saxon window, built of Roman bricks, the upper part of the tower being Early English; the nave is Transition Norman; the aisles, formerly Early English, now contain in the south decorated windows of about A.D. 1350, and in the north Perpendicular; the chancel is Saxon, an inside arch of chalk being considered by Mr. Parker to be of Edward the Confessor's time. There are also Early English lancets, and the chancel has been continued eastwards. The windows on the south side and the fine one at the east end are Decorated. About twenty years ago some mural paintings were discovered in the church. The most important of these were two figures found on the walls of two recessed niches, north and south of the chancel-arch; the masonry of the arches over these niches is very early and probably Saxon. The figures were too imperfectly preserved to admit of any positive conclusions as to the saints intended to be represented. There was, however, very little doubt, from the remains of the head-dress of one of them, that it was intended for St. James. The other was probably the Blessed Virgin. The figures belonged to the early part of the fourteenth century. Beneath the paintings were indications of two earlier coats of colour, which soon disappeared on being exposed to the air. One piece, which was of the fifteenth century, showed a very flowing design; this was in the soffit of the arch on the north side. A black and white design, arranged in the pattern of a chess-board, was in the soffit of the south aisle arcading, and was of a much later date. There were in the capital of the first column the mortice-holes of the roof-loft beams. Some of these holes had been coloured black in distemper. The other design, containing a flower and leaf-tracing, was very good. This was in the soffit of a window of Edward II.'s time, which had been blocked up in the latter part of the fifteenth century. When the walls were cleared of the plaster there was hardly a portion where colour had not been; unfortunately it dropped off on the removal of the white-wash. The brilliancy of the colours, while they lasted, recalled what may be seen at St. Cross, near Winchester. It was impossible to preserve any portion.

St. Ambrogio, Milan.

This building is one of the most interesting monuments of the Middle Ages. Constructed on the usual plan of the Latin basilicas, it is of noble dimensions, and though of a ponderous character, is free from the monstrous imagery with which the churches of the eighth century were usually disfigured. In this church, as at St. Agnese at Rome, there are galleries, and windows above the galleries. St. Ambrogio was thoroughly repaired by Archbishop Oberto, and his successor, Philip, in the latter part of the twelfth century, on which occasion the original style of the building appears to have been preserved, but this was not the case when the church was again repaired in the thirteenth and fourteenth centuries. At the time of the second reparation the pointed arches were introduced. But the most remarkable feature of St. Ambrogio is the magnificent atrium, fully as large as the nave of the church. Here we feel the influence of Rome, and the general plan of the building shows the respect which was constantly commanded by the apostolic basilica and yet modified by Teutonic feeling.

Niches.

There are very few cases in which these do not act injuriously on a composition, from the difficulty of making them cohere with the other parts; the usual mode in Italian practice is to give them the effect of windows, which cannot be approved of. Internally they may be used with much better effect than on exteriors. If a niche is intended to receive a statue it should have a circular head; if a vase, it will perhaps be better straight. The plan of a niche is semicircular.

NOTES AND COMMENTS.

So many risks attend hydraulic works, there are numerous contractors who, although courageous enough, will not undertake that class of work, for they believe it needs the skill of specialists. The Shoreham Harbour Trustees have had no fear of attempting operations that would daunt practical men. A contractor offered to set the piling of one of the wharves on economical terms, but, as the Trustees considered he ought to have charged for materials alone, and would not allow any sum for labour, they resolved to carry out the operations themselves. They now find that, although they have obtained a 20-cwt. steam-ram, the piles are refractory and will not descend, and if they go down it is in a wrong position, where they form so irregular a line that a source of danger to shipping will be created. Being amateurs the Trustees did not take any trouble to discover what kind of material had to be pierced. They thought piles had only to be rammed and at once they sank. Now it is imagined there is an impediment caused by the remains of ancient piling, and we expect to hear that the Trustees have commissioned some dentist in Brighton to draw the stumps. If a difficulty of the kind arose with a contractor there would be no mercy shown him, and he must contrive to fix the piles on the line indicated. But some Trustees consider it would be better to try another line, although the waterway would be narrower, while others propose getting out of the difficulty by abandoning close piling and substituting a few piles with planks nailed to them. A few sensible members, however, consider it will be better to kiss the rod, humbly admit the failure, and implore the rejected contractor to get them out of their difficulty. That is the only way to prevent the harbour from becoming useless. At the same time why should not the Shoreham Trustees be allowed to amuse themselves by meddling with construction as well as other bodies? They are under the disadvantage of having their folly exposed. But if a similar effort had been made at the riverside in London, it would be announced in Spring Gardens that the work was an extraordinary success, and completed at a tithe of the price which Messrs. AIRD or other experts in hydraulics would have charged.

THE venerable Professor DIETRICHSON, of Christiania, who has done more than any man of the century to create an interest in Norwegian buildings, read a paper on Drontheim Cathedral at the Congress on Art History which was held last week at Cologne. It was listened to with the utmost respect. According to the latest researches, the building represents four periods. Christianity was unknown in that part of Europe until a comparatively late period, and a cathedral at Drontheim was not commenced until the year 1077. When the bishopric was changed to an archbishopric the people resolved to make the building more worthy of its dignity, and an enlargement was commenced in 1161. The work was interrupted by one of those contests which were common among the Norsemen. In 1183 the works were resumed, but the cathedral was not completed until 1299. The choir is the most beautiful part of the building, and Professor DIETRICHSON says there is no doubt it was a derivation from Canterbury. The sculpture and ornament were also evidently derived from English models, some of the heads being remarkable for their vigour. A period followed which was not advantageous for the nationality of Norway, and the cathedral seemed to exemplify the state of the country. Between 1328 and 1719 five conflagrations occurred. During the last century it was a ruin. When in the present century the Norwegians became conscious of their old greatness, the restoration of the cathedral became a national work, and so far has been vigorously promoted.

FROM the time they left the North of Europe the history of the Longobards, as hitherto written, consists in little more than feats of broil and battle. As became members of the Germanic race they were not, however, without desires to express their feelings in other ways, and Professor IMMERMANN was able to prove at another meeting of the Cologne Congress that the Longobards were artists. His discoveries on the subject were too numerous to be explained in a limited time, and he could only give an

indication of them. The time of the arrival of the Longobards in Italy is uncertain, but under ALBOIN they crossed the Alps and seized Lombardy about A.D. 568. Their invasion extended to Sicily. Their settlements can be identified by reliefs in which ornament is seen that consists of figures of strange animals, and which must have been a continuation of a style that was familiar in the North. In Friuli examples are common. They found the Byzantines had gained a footing in Italy. Frequently there were contests between the two, but sometimes they entered into alliances. There is much ornament which seems to be symbolical of the union, for the Germanic beasts are mixed with Byzantine scrolls and other conventions. The Professor might have added that the combined ornament also suggests the beginning of a reign of law, the overcoming of wild animal nature by bonds that, like the ornamental scrolls, may add dignity or punishment according to their acceptance.

IT WAS FAIRBAIRN, we believe, who first demonstrated at one of the meetings of the British Association that the strength of a variety of girders can be exhibited by diagrammatic lines. As iron and steel may be considered as constant in their power to resist compression and extension, it is easy to express that quality in the same way as any of the other natural forces, or as the results of statistics on a large scale. The large "girder sheet" which Mr. J. ARMER, C.E., has prepared for Messrs. J. BIRCH & Co., reveals the utility of using strength-diagrams for the rolled joists and rivetted beams which are required in everyday practice. By using two colours it becomes easier to trace the strength or rather safe load-line for any girder than if all the lines were in black. The diagrams relate to rolled steel joists, compound girders and rivetted girders. The safe load is taken as one-third the breaking load. The "girder sheet" will be a useful addition to the aids and appliances in architects and contractors' offices.

BEHIND the building in the Champs-Élysées where the Salon exhibitions are held is another which is the property of the Paris Municipality. It is used for occasional exhibitions mainly of an industrial sort. The position is of some importance, for it allows the city to have a sort of footing contiguous to the Government, for the Palais used for the Salon exhibitions is national property. In the proposals for the international exhibition of 1900, the architects can assume that the Palais will be removed, and any other buildings on the same side of the Champs-Élysées. That would apparently mean that the Municipal Building must also succumb to the necessities of the project. The Municipal Council are not disposed to allow their property to be demolished so easily. They have had their building almost reconstructed at a large expense, and in May next it will be in a condition to vie with the neighbouring Palais de l'Industrie as a place of exhibition. It will be necessary to determine about that time whether the Commissioners of the Exhibition of 1900 are stronger than the Municipal Council. The reconstructed building may have to vanish, but its value will be found to have increased tenfold, and a corresponding compensation will have to be given before any rights in it can be acquired.

A SECOND edition of MEYER'S "Handbook of Ornament" has been published by Mr. BATSFORD. It is unnecessary for us to express anew our admiration of the collection of examples, for the success of the book is evidence that what we said about the first edition has been endorsed by the public. A cheaper or more complete aid for the ornamentist is not to be found. A student who devotes weeks or months to the consideration of the plates, or whatever time is necessary to enable him to acquire definite ideas of the numerous subjects, will find he has gained an increase of power that will be advantageous to him throughout his career. The handbook should not be treated like a Post Office Directory and consulted only in emergencies. It merits to be made a subject of systematic study until the characteristics of the examples are impressed on the memory, and the result will well repay all the days that are spent in the work.

THE illustrations we publish this week are reproduced from drawings exhibited this year at the Royal Academy, and representing the building which is now in progress from the designs by Mr. JOHN W. SIMPSON and Mr. E. T. MILNER ALLEN, of 10 New Inn, Strand. The foundation-stone was laid on April 3 by H.R.H. the Duke of YORK.

The site measures about 300 feet by 90 feet. The buildings are arranged in two blocks, having frontages to Foregate Street and Taylor's Lane and Sansome Walk and Taylor's Lane respectively. They are of red brick with buff or tawny terra-cotta and roofs of red Broseley tiles. It has been the desire of the architects to avoid the modern rendering of the Queen Anne type and to produce a building in the style of the latter part of the seventeenth century, which, being simple and quiet in its lines, will not be out of character with the dignity of the ancient city.

The block nearest to Foregate Street contains the library, museum and art gallery. The principal gable will be surmounted by a partially-armed figure in terra-cotta, resting on a sword and bearing a palm branch, emblematic of the city motto, "Civitas in bello in pace fidelis." The block has a central entrance from Foregate Street leading into the ante-vestibule. An open gallery on the first floor with seats in the recesses of the balustrade forms an effective feature, and gives greater dignity to the ground floor by increasing the height and at the same time improving the light and ventilation. A staircase of marble and mosaic, with steps 7 feet wide, leads to the museum and art galleries on the first floor. On the ground floor the reference library, 48 feet by 20 feet, is placed next to the Shirehall, with the tables arranged so that all the readers will face one way, lighted from the left hand, and under complete supervision from the service counter. Between it and Foregate Street is the committee-room (20 feet by 25 feet), with windows to Foregate Street. The news-room (84 feet by 22 feet) has end bays, and is situated in Taylor's Lane; it has a separate entrance from the street. It is immediately overlooked by the librarian, whose office controls the whole floor space. The book store is central, with the serving counters for the lending and reference departments contiguous; there is direct top light to the indicators. Access is provided to the basement floor, which is 10 feet high and of considerable dimensions. The access to the museum and art galleries on the first floor is provided by means of two staircases, the second one being in Taylor's Lane. On the first floor there are five museums and three art galleries. The former are on the Shirehall side, and the art galleries are over the news-room. The central and largest museum gallery is 45 feet 6 inches by 22 feet, and is to be named after Mr. ROWLEY HILL. The central art gallery is of the same dimensions and is to be called the "Charles Wheelley Lea Gallery." There are also provided cloak-rooms, curator's room, &c. At the corner of Foregate Street and Taylor's Lane is a circular tower with a staircase to the roof. Between this block and the schools block is an open space which will allow of future extension of the building.

The schools block accommodates the art, science and technical schools, having an elevation to Sansome Walk. The staircase immediately behind the central entrance gives separate access to each school, and each floor is divided by a corridor running the whole length, which allows access to a department without causing a thoroughfare through any other. The science school on the ground floor contains on the Taylor's Lane side a lecture theatre, with an arrangement of seats in tiers. It is 50 feet by 32 feet and 26 feet high, having an entrance from the corridor, another from Taylor's Lane, and a third by a staircase from the professors' room behind. The rest of this side of the floor is occupied by stores, and between the

lecture theatre and Sansome Street by the caretaker's entrance and men's cloak-rooms. On the other side of the corridor is the women's cloak-room, and behind it are two classrooms; behind these is the laboratory, which is shut off by screen doors to prevent fumes in the corridor. Behind this again are the balance-room and a preparation-room. Beneath these rooms are a long range of north-lighted workshops for the technical classes. They can be divided into sections as desired. Lavatories are provided for every department. The first floor is devoted to the art school. The elementary school, which has a top light, is 50 feet by 22 feet, and on the other side is an antique-room 60 feet by 21 feet. On this floor are also a painting-room, modelling-room, designing-room, master's-room, cloak-rooms and conservatory. The two blocks are connected by a subway. Messrs. WOOD & SONS are the builders, the foreman in charge being Mr. ADAMS, and the clerk of the works is Mr. BUSH SAGE.

TYNWALD HILL, ISLE OF MAN.*

WE stand on a spot as interesting to the antiquary as it is dear to the heart of every Manxman. In it we recognise the pivot round which for well nigh a thousand years has revolved the political life of this diminutive kingdom. Here new laws have been made and old ones declared and explained, grievances disclosed and redressed, differences between litigants adjudicated on and settled, criminals punished or outlawed. Here in the open air for many centuries the inhabitants of this happy isle have assembled to meet their kings, their governors, their judges and their lawgivers; and, improving the occasion, they have established here their fair ground, wherein to transact their commercial business. In the construction of this mound we feel a peculiar interest, for tradition tells us that it is composed of soil brought from each of the seventeen ancient parishes of the island. We stand on representative ground. It consists, as you will observe, of four circular platforms, the lowest having a circumference at the bottom of 256 and at the top of 240 feet, the second has a circumference at the bottom of 162 feet, the third of 102 feet, and the topmost of 60 feet. The total height of the mound is about 12 feet. A writer in "Notes and Queries," of February 1871, traces a symbolical meaning in and gives several interesting results from these figures. I am unable to follow him, but I think it right to point to the existence of these speculations.

The hill and the purposes for which it exists are, of course, of Scandinavian origin. The mound is known as the Tynwald Hill, modernised or Anglicised from the Norse "Thing Völla"—Parliament field—of the Middle Ages. There is a striking resemblance between our Tynwald arrangements here and those of the ancient Norse moot places, remains of which are to be found in Iceland, in Norway and elsewhere. Dr. Vigfusson points out some of these. There was always a plain (völl); here we have a plain flanked by rising ground. There was a hillock or mound; here we have this artificial mound constructed for the purpose. There was a court situate due east of the hill; here we have the court at the distance of about 140 yards east of the hill. There was a temple, a place of religious worship; here we have a church, dedicated to St. John the Baptist, on the site of older churches. There was a path for proceeding from one to the other; here we have such a path. The whole was enclosed by a fence; here an encircling wall exists. When the king sat on the hill, it was with his visage unto the east; the arrangement is the same here, as I shall explain later. All these points of resemblance exist, but there is one essential and vital difference between the institution here and what exists there. There we find only evidence of a life which has long ago become extinct, we find the skeleton from which we may guess what manner of man it supported; here we have the complete body, living and moving and having its being in the same form and to the same extent as it had when it was borne hither in the galleys of the Vikings one thousand years ago. It is remarkable, indeed it is romantic, that this interesting and picturesque institution which centuries ago died out in the mother country should have survived in this remote little colony and taken such firm root in a land where it was exotic; that in the midst of so many changes in the neighbouring countries, our home rule should have remained practically unaltered, so that we can boast of possessing the most ancient constitution in Europe.

The Danes and Norwegians who occupied this island for some three and a half centuries, ending about 1264, brought with them here, as to other places conquered by them, their laws and form of government. They established here a king

* An address delivered by Deemster Gill at the visit of the Cumberland and Westmorland Archaeological Society.

dom, the territorial limits of which comprised, as well as the Isle of Man, all the islands of the Hebrides which lie south of Ardnamurchan Point. The kingdom was designated "Man and the Isles," and its king "Rex Manniæ et Insularum." The seat of government was in the Isle of Man, probably at Castle-town; and of the twenty-four freeholders comprising the House of Keys (the representative branch of the Legislature), eight were chosen in the "Out Isles" and sixteen in the "Land of Man." The number of the Keys appears to have been originally fixed at twenty-four; it remained unaltered after the extent of the kingdom was reduced by the separation of the out isles, and it is the same to this day. The Keys were known by the Manx people as the "Kiare-as-feed," the four-and-twenty, and this is probably the origin of the name "Keys." It is, by some, thought to be derived from "Keise," the Norse equivalent of "chosen," and other suggestions as to the derivation have been made, but none appears quite satisfactory. The Keys were the third estate in the Manx Constitution; the second estate consisted of the Council—the Lord's principal officers, including or having associated with them the two Deemsters; and the first estate was the Sovereign or Lord of the Island. The formal designation of the Legislature is "The Governor, Council, Deemsters and Keys in Tynwald assembled." Thus constituted, this national Council or Thing, in later days known as Tynwald, met from time to time for judicial, legislative and administrative purposes. For judicial and administrative purposes it appears to have met in other places besides the hill at St. John's, for instance at Castletown, at Reneurling in Kirk Michael, at Keil Abban in Kirk Braddan and elsewhere, but it is doubtful whether for the purpose of the promulgation of laws it ever met except at St. John's.

It has been suggested, but I think that there is little foundation for the suggestion, that Tynwalds, each comprising twelve Keys and one Deemster, met respectively at the south and north of the island. It is undoubted that very marked differences have existed between the two districts; different laws and customs have existed and still exist in each, and the people speak with a noticeable difference in the intonation of voice. But I cannot find that there was even this splitting of the Tynwald. There is evidence of the Tynwald having sat at Reneurling in 1422, and at Keil Abban in 1429, but I think the court sat as a whole. Keil Abban is situated as nearly as possible in the centre of the island. It is exactly equidistant between the Point of Ayr on the north and the Land of the Calf on the south, and within half a mile equidistant between the east and west coasts. Whether this placing was the result of accident I do not know. There was a hill and an ancient church, but the church was not east, but south of the mound. More might be said as to Keil Abban, or Keil Ammon, but time forbids.

We must turn to the modern use of the Tynwald Hill. After the Norsemen the Scots ruled here for over a century; after them the Earls of Derby were lords. Sir Stanley, second of this line, visited his kingdom and held a Tynwald in 1414. For his instruction the following document was prepared:—"Our Doughtful and Gracious Lord, this is the constitution of old time, the which we have given in our days, how ye should be governed on your Tynwald Day. First, ye shall come thither in your royal array, as a king ought to do, by the prerogatives and royalties of the Lord of Man; and, upon the hill of Tynwald, sit in a chair covered with a royal cloth and cushions, and your visage unto the east, and your sword before you holden with the point upward, your Barons (in the third degree) sitting beside you, and your benefited men and your Deemsters before you sitting, and your clerks, your knights, esquires, and yeomen about you (in the third degree), and the worthiest of your land to be called in before your Deemsters, if you will ask anything of them, and to hear the government of your land and your will, and the Commons to stand without the circle of the hill with three clerks in their surplices, &c." This imposing ceremonial in the prescribed form continues to take place here annually on July 5 (the 24th of June, old style—St. John's Day), and all the laws which have during the year been passed by the Legislature and received the Royal assent are promulgated in English and in Manx to the assembled multitudes. No statute is of any validity until it has thus been promulgated. After it has been passed by all the estates of the Legislature, it lies dormant until it has been proclaimed from the Tynwald Hill.

THE STORY OF TEMPLENEWSAM.

IN connection with their visit to Leeds T.R.H. the Duke and Duchess of York were the guests of Mrs. Meynell Ingram. The *Leeds Mercury* in an interesting article says:—"This is not the first occasion on which Templenewsam has been honoured with royal visitors, for both in modern and less recent times that historic and beautifully situated mansion, and the noble demesne of which it forms a part, have had associations with royalty. Some twenty-six years ago the Heir-Apparent when he came to open the Leeds Infirmary was a guest there; and

early in the present century the then Prince of Wales, afterwards George IV., visited Templenewsam, and the superbly painted paper which adorns the walls of the ante-room to the red drawing-room in the south wing was a gift from the "First Gentleman of Europe" to the Lady Irwin of that day. At an earlier period the associations of royalty with Templenewsam were of a closer nature. In 1545 Lord Darnley, the ill-fated consort of Mary Queen of Scots, was born at Templenewsam, and the birth-chamber in the south wing is still known as Darnley's room. The mansion has seen many mutations or ownership, and there is some amount of scepticism as to the identity of this room; but there is little reason to doubt it, for so eminent an authority as Thoresby states that when, about the year 1622, Sir Arthur Ingram rebuilt the mansion, Darnley's room was preserved intact and incorporated in the new edifice. Indeed, the subsequent discovery, during some restorations carried out by the present owner, of the ancient doorways and masonry would appear to give absolute confirmation to the theory. Thoresby, moreover, speaks of a bed, which apparently had formed part of the furniture of the original mansion, and on which was inscribed in gold letters, "Avant Darnley, jamais derrière." This room is certainly the only trace of the original house of the Templars which remains. As will be seen, the estate in still earlier periods of its history reverted on more than one occasion to the Crown, and that proceeding generally followed the downfall, if not the death, of its owner.

Until the Knights Templars came into possession, Newsam was an unimportant hamlet, but from that date its history is one that has always been interesting and often eventful. The order of the Templars was instituted in 1118, and it was about the year 1181 that they established a Preceptory at Newsam. The land was either granted by, or purchased from, William de Viliers, who held it as tenant of the powerful house of De Lacy of Pontefract, and an ancient charter exists in which Henri de Laci, in the capacity of overlord, confirms the grant. There is no reliable clue as to where the Preceptory stood, though there is a scrap of evidence which goes to show that it did not occupy the present site of Templenewsam. In "Records of the Parish of Whitkirk"—a handsome and interesting volume compiled by Mr. George Moreton Platt and Mr. John William Morkill—there is a note appended to the chapter on Templenewsam which states that "in the ancient terrier of the Rectory of Whitkirk mention is made of a building called the Old Temple and of several parcels of land belonging to it. Amongst the latter is Kitchingham's Close, which we find marked on the tithe-award map near the beck which separates the township of Templenewsam from that of Thorp Stapleton, to the north of Thorp Hall." This Old Temple was, indeed, in existence within the last 150 years. Wherever their Preceptory stood the warrior-monks of the twelfth century gave Templenewsam its name, and their name is ineffaceably associated with its history, faint as are the records which remain. They continued in possession of Templenewsam until the dissolution of the order in 1312. Powerful as it was, and high as was the purpose with which it was established, the order had, comparatively speaking, a short existence. For many years it enjoyed very great prosperity, but it was the very growth of its wealth and influence which hastened its downfall, for luxury bred corruption and undermined in its members those stern qualities which had made them well-nigh omnipotent in the land, and its wealth and immense power excited at once the avarice and fear of Edward I., who then sat on the throne of England. In "Ivanhoe" Scott paints Bois Guilbert, the most renowned Templar of his day, in a very unamiable light, and another writer tells us that these knights, banded together as they were by Baldwin, king of Jerusalem, for the defence of the Holy Sepulchre and the protection of Christian pilgrims, "afterwards sank to the lowest state of depravity." The weight of opinion of well-informed students of the history of the period does not support this sweeping condemnation, but certain it is that the enemies of the order completely triumphed. But while it was thus exterminated, root and branch, something more than a mere memory of the Templars of Newsam still remains, for, like many other places in the district, Leeds to this day retains traces of the ancient privileges of the Templars—some houses which belonged to them being marked with their cross, as a sign of exemption from the obligation to grind at the Soke Mill; and Timble Bridge, leading from Leeds to Newsam, is said by Thoresby to be a corruption of Temple Bridge.

For a time after the extinction of the order of Knights Templars, Templenewsam was placed successively in charge of Adam de Hoperton and Sir Alexander de Cave and Robert Amecotes as custodians, and then was granted by Edward II. to Sir Robert Holland, a soldier of fortune, who was afterwards summoned to Parliament as Baron Holland. He owed his advancement almost entirely to the Duke of Lancaster. Yet when his patron placed himself at the head of a rebellion of the barons in 1321, Sir Robert, after promising him support, betrayed his cause to the king. His treachery brought its own punishment

however, for his possessions were seized and he was beheaded, a fate which befel a later and more distinguished successor to the estates. From the list of Sir Robert Holland's forfeited possessions it appears that he also owned the manor of Yoxall, with Hoar Cross, in Staffordshire, which, strangely enough, again in after years came into the possession of the owners of Templenewsam. Edward subsequently transferred Templenewsam to the Knights Hospitallers, but they held it for only a brief space, and in 1324 the estate was by arrangement restored, with the exception of the church at Whitkirk, to the Crown. Edward III. afterwards gave the estate to his kinswoman, the Countess of Pembroke, and the reversion was granted to John, Baron Darcy, who attained to eminence under the second and third Edwards, who fought at Cressy, and was at one time Lord Justice of Ireland. The Countess of Pembroke, however, outlived both Lord Darcy and his son and successor, who was also a distinguished soldier. The latter had married Elizabeth, daughter and heiress of Nicholas Meinill, Lord Meinill of Whorlton, and her second son assumed the title of Baron Darcy and Meinill, and after the death of the Countess of Pembroke obtained possession of the Newsam estates. The Hospitallers unsuccessfully contested his title, and in 1402, in the time of Philip, the fourth Baron, they made another abortive attempt to gain possession of the estates, which remained in the possession of the Darcys until the sixteenth century, when the last and perhaps the most celebrated member of their house, Thomas, Lord Darcy, was beheaded by Henry VIII. for the part he took in the "Pilgrimage of Grace"—a melancholy ending to a long and honourable and distinguished career. After his death Templenewsam passed to a Scottish family which stood near to the line of succession to the throne of the northern kingdom. The king presented it to Matthew Stuart, Earl of Lennox, whose son was the unfortunate Henry, Lord Darnley. Through Lord Darnley the estate passed to his son, James I. of England, who granted it in turn to Ludovick Stuart, Duke of Lennox, and with its sale by that nobleman to Sir Arthur Ingram, what may be termed the "modern history" of Templenewsam commences.

Sir Arthur Ingram was a son of Hugh Ingram, a native of Thorpe-on-the-Hill, who had amassed a fortune as a draper in London. Sir Arthur, who also adopted a mercantile profession, was a man of great ability, and being fortunate enough to gain and obtain the friendship of King James, he rose to fame and fortune. He thereby incurred the bitter enmity of the courtiers, and had in consequence to give up an appointment he held in the royal household, though he received ample recompense in other ways. He sat for the city of York in the last Parliament of James I. and the first two of Charles I., and he it was who rebuilt Templenewsam. It had not been long completed when the fire occurred to which Lord Strafford refers in one of his letters as occurring on Shrove Sunday, and doing damage to the extent of 4,000*l*. Only the south wing of the building was, however, affected, and it was restored in 1796 by Frances, Viscountess Irwin. With the advent of the Ingrams, the vicissitudes of the fortunes of the owners of Templenewsam may be said to have ceased. Sir Arthur's second son was for his fidelity to the Stuart cause rewarded by Charles II., in 1661, with the title of Viscount Irwin in the Scottish peerage. The fourth Viscount was Lord Lieutenant of the East Riding, and the fifth, who was governor of Hull, married Lady Anne Howard, who was the third daughter of Charles, third Earl of Carlisle, and who was a poetess of some repute. With the ninth viscount the male line became extinct. Of his five daughters, one married the Marquis of Hertford, who, on succeeding to the estate, took the name of Ingram. The third daughter, Elizabeth, had married Hugo Meynell, of Hoar Cross, in Staffordshire, and on the death of the son of the Marquis of Hertford the property passed to their descendant, and the Templenewsam and Hoar Cross estates once again became united. The widow of their grandson is the present owner of Templenewsam.

The mansion, as is probably well known to many of our readers, is built of brick, and forms three sides of a quadrangle. Of imposing exterior, internally it is richly, though appropriately appointed, and it is crowded with articles rich and rare. The picture gallery in the north wing is a magnificent apartment, and the private chapel leading out of it is a marvel of decorative art. For a long time past the reconstruction of the staircase at Templenewsam has been in contemplation, and the work was only recently completed. It is a magnificent structure in dark oak, elaborately carved, and with the shields of the family introduced. The ceiling overhead is of very ornate design, and below the frieze are displayed three shields, namely, that of Lady Lennox, the mother of Lord Darnley, and that of the Ingram family, the third bearing the arms of the Meynell-Ingram and Wood families. On the wall of the staircase hangs a very fine piece of tapestry, representing the death of Ananias. Mr. Wheeler says of the series of family portraits, from Sir Arthur Ingram to the present generation, that "besides the intrinsic merits of several, as works of art, it

forms an excellent study of English costume for more than two centuries." The collection of paintings, as a whole, is an extremely valuable one, including, as it does, examples of Guido, Albert Dürer, Vandyke, Titian, Rembrandt, Paul Veronese, Watteau, Borgognone, Poussin, Holbein, Reynolds, and other great masters. Other features of the mansion are the superb wainscoting of the dining and billiard-rooms, and the collection of antiquities which the latter apartment contains. It may not be uninteresting to add that there is in possession of the family a gilt tea service which had belonged to Frederic, Duke of York, the son of George III., and Prince George's predecessor in the title. It was bequeathed by Admiral Henry Meynell, on his death in 1865, to his brother, Hugo Charles Meynell-Ingram.

Whitkirk Church, which is believed to have passed to the Templars along with the lands obtained from William de Viliers, and which lies just outside the park gates, contains many memorials of the baronial house of Irwin. Not the least noteworthy monument in the sacred edifice, however, is the marble tablet on the north wall of the chancel, in memory of John Smeaton, the eminent engineer and builder of the third Eddystone Lighthouse. For some generations the Smeatons inhabited Austhorpe Lodge, which was built in 1698 by the grandfather of the engineer, and an interesting example of Smeaton's skill remains to this day in the shape of the ram which he constructed more than a century ago in the grounds at Templenewsam, for the purpose of forcing the water required for domestic purposes up to the mansion. It still serves that purpose, forcing water to a distance of 26 feet above the supply level at the rate of 60 gallons per hour, the engine making eight strokes per minute and driving about a pint per stroke. Another work of Smeaton's which is still in use in this district is a water-wheel at the Foundry Mill, near Seacroft, and both are stated to have required but few repairs since they left Smeaton's hands.

ARCHÆOLOGY IN SERAIEVO.

IN a letter to the *Times* Dr. Robert Monroe, of Edinburgh, gives an account of an archæological congress recently held under Government patronage in Seraievo, from which we take the following extracts:—

The actual business was begun when Baron Appel, after thanking the strangers for coming so far to take part in the scientific investigation of the antiquities of Bosnia and Herzegovina and wishing them success in the important deliberations in which they would be shortly engaged, called on Herr Hörmann, director of the museum, to read a paper on "Das bosnisch-herzegovinische Landesmuseum, seine Organisation und Ziele." Then followed another paper by Dr. v. Thallóczy (director of the archives) on "Die Culturperioden Bosniens und der Herzegovina, mit besonderer Rücksicht auf ihre monumentalen Ueberreste."

Afterwards the members were invited to adjourn to the museum to inspect its treasures under the guidance of Herr Hörmann (Early Christian and other monuments of the Middle Ages), Dr. Patsch (Roman antiquities), Herr Fiala (the prehistoric discoveries at Glasinaé and Sobunar), Dr. Truhelka (the collection of costumes), and Dr. Glück (anthropological collection). On this occasion, however, the visit was only introductory, but ample opportunities were subsequently given for a more careful study of its contents.

Meantime special attention was directed to a group of antiquities of the Stone Age, consisting of an immense quantity and variety of fragments of pottery, flint and other stone implements and weapons, &c., arranged by Berghauptmann Radimsky in one of the ground-floors of the museum, as in the afternoon the locality would be visited where these remarkable objects had been found. The excavations which yielded this assortment of early relics were still conducted by Radimsky, at a place called Butmir, in the vicinity of Ilidze. The fertile plain of Ilidze, which occupies a wide basin, has been formed by the *débris* of streams and rain-washed materials from the surrounding hills. The river Bosna, the main source of which suddenly springs out of the earth at the foot of the hills some two miles to the south, is virtually formed by the junction of a number of surrounding streams, meandering through the plain from different directions. In earlier times it is probable that this basin was more or less a lake, and, indeed, in winter portions of it become still submerged. Almost in the centre of this plain, and only separated from the grounds of the modern baths of Ilidze by the sluggish waters of one of the streams of the Bosna, there is a portion of land covering many acres, which on careful inspection is seen to be slightly more elevated than its surroundings. Some time ago it was discovered that all this raised area was composed of the *débris* of early human occupancy. Part of this prehistoric settlement or workshop, as some suppose it to be, is presently occupied by a large dairy and other buildings, but the rest is simply

arable land and can be readily excavated. The relics have been found scattered throughout the *débris*, apparently at all depths from 6 feet to 10 feet or so. A perpendicular section prepared for the members of congress showed this *débris* to be composed of clay, mould, charcoal, &c., arranged in more or less parallel strata, with here and there some wavy undulations. The method of excavation hitherto carried on seemed to have for its main object the collection of relics, and consisted in merely turning over the relic-bearing stuff till the virgin soil, a fine yellowish clay, was reached. The discovery of occasional hollows in the surface of this clay suggested to Radimsky that they might have been the foundations of the huts of the inhabitants, whose remains had accumulated above and around them. I may observe that there was no clearly-defined line of demarcation between these respective materials, viz. the virgin clay and the culture beds above, as bits of charcoal were often seen embedded in the former to a depth of several inches.

Radimsky's theory of this settlement was generally adopted by the members of congress, except by Professor Pigorini and myself, who argued that the entire phenomena, especially the stratification of the culture *débris*, could only be explained on the supposition that the huts stood on platforms supported by wooden piles, and that the refuse, together with the lost and worn-out implements, had gradually accumulated in the vacant space underneath. Hence the "find" at Butmir became the subject of an animated controversy at the congressional sederunt next day. Pigorini opened the discussion in a long speech, in which he advocated that there was a precise analogy between the deposits at Butmir and those of the Terremare of Italy. The principal objection to this theory was the absence of piles, of which hitherto not a trace had been observed, nor of any wood whatever. In defending Pigorini's views I pointed out that, although the actual piles were not now to be seen, all the woodwork having completely decayed, traces of the holes in which they stood might be found—a fact which was clearly established on the next visit by the discovery of several round holes penetrating into the underlying virgin clay. On section these holes were seen to have become filled up with clay and charcoal. But of course it has to be yet proved that the wooden uprights which formed these holes had been part of a general system of pile-structures. The result of the discussion was that further excavations were considered necessary, particularly in the direction of the limiting margin of the mound, before a trustworthy opinion could be formed in regard to the structure and origin of this remarkable settlement.

After inspecting the excavations at Butmir the party crossed the river by a wooden bridge to Ilidze, with its fashionable and elegantly laid-out grounds, baths, hotels, playgrounds, lawn-tennis court, flower beds, promenades, aviaries, &c. The primary attraction for all this display is its celebrated sulphurous spring, the curative qualities of which had been known to and largely taken advantage of by the Romans—a statement which is clearly proved by the remains recently unearthed around the spring, viz. foundations of houses, mosaic pavements, baths, water conduits, together with an assortment of the usual industrial remains of Roman civilisation. Some of the mosaic pavements are preserved *in situ*, but many of the smaller objects have been removed to the museum at Seraievo. Guided by a careful consideration of these Roman remains, the spring has been traced to its original source, and it is now surrounded by a circular stone basin, within which the hot water may be seen gurgling and bubbling up in large volumes.

Another locality to which an excursion was made, partly by carriages and partly on foot, was Sobunar, situated on the lower flanks of the lofty Trebević, immediately to the south of Seraievo. Here were found the remains of prehistoric huts, which contained a remarkable kind of pottery—vessels with projecting handles, strongly reminding one of the *anse cornute* of the Terramara mounds. There was besides a large assortment of bronze and bone implements and ornaments—fibulæ, pins, chains, pincers, combs, spindle whorls, &c.—and a few objects of iron. On the top of one of the most commanding spurs were the remains of a Roman fortification, the foundations of which had been recently partially exposed.

The next and most exciting of the field excursions was a visit to the high plateau of Glasinaë, situated among the mountains to the east of Seraievo, and entailing two days' hard work with carriages and riding-ponies. The excavations were so skilfully arranged that the merest working with the fingers was sufficient to expose the interments. Hence there was no time lost in bringing the eagerly-looked-for treasures to light. One body was that of a female, which had on the bones of each arm a bronze bracelet. On its upper part lay two four-lobed flat fibulæ and a hollow bead, all of bronze. The bracelets and fibulæ were ornamented with incised lines and concentric circles. The pins of the fibulæ had been of iron, but of these nothing remained excepting a little mass of the oxide of that metal at the points of attachment. Among the other grave-goods were a couple of fibulæ of the usual bow-shaped form, a bronze diadem and a peculiarly-shaped stone implement.

The forenoon of Tuesday, August 21, was devoted to a discussion on the antiquities investigated during the excursion, more especially on the age and place of the Glasinaë tumuli in the prehistoric civilisations of Europe. In the afternoon the more ardent spirits, headed by Pigorini, again visited the prehistoric remains at Butmir, but nothing further was discovered to clear up the mystery which still hangs over this settlement.

Another important group of objects exhibited in the museum was that recently collected near Bihaë, in what was formerly part of the bed of the river Una. From the numerous photographs, plans and sections so carefully prepared by Herr Radimsky, of the phenomena encountered during the excavations, there can be little doubt that he is right in regarding the habitations which stood there as veritable pile-structures. To this opinion the character of the remains lends support. Among the food refuse and relics collected were the broken bones of a variety of domestic and wild animals; some cereals, seeds and fruits; fragments of pottery, spindle whorls and a number of stone moulds for casting bronze celts; implements, weapons and ornaments of metal—all of which prove that the inhabitants here prosecuted the usual arts and industries of pre- and proto-historic times. Among the relics are a few characteristic specimens of La Tène culture, as well as objects of Roman and Mediæval times. The area investigated was thickly studded with the stumps of piles, and its extent was too great (some 30 yards long by 20 broad) to give countenance to the suggestion that it formed the basis of some special building, such as the corn-grinding mills, still constructed on piles and common along the streams of the country.

MANCHESTER SOCIETY OF ARCHITECTS.

AT the first meeting in the session of 1894-95, the president, Mr. John Holden, delivered his address to the members. After reviewing the proceedings connected with the reconstruction of the Society in 1891, which resulted in a large increase in the membership (now numbering 135), he urged the members generally to assist in carrying out the Society's objects, and by close attention to the rules and regulations to minimise the labours of the honorary officers. He paid a kindly tribute to the memory of some deceased members, viz. Messrs. John Elgood, Joseph S. Crowther, William Charles Tuke, James Maxwell and Lawrence Booth, whose loss, he said, would be especially felt by the older members of the Society. He also regretted the decease of Mr. J. H. P. Leresche, who had for ten years occupied the position of honorary legal adviser to the Society. The council had nominated Mr. William Goldthorpe, barrister-at-law, as Mr. Leresche's successor, and the appointment had been accepted by him. After touching upon the question of competitions, of builders depositing priced quantities for works to be carried out and other matters, the President said that he hoped before long to see a Chair of Architecture founded at the Owens College. This would be a great advantage to the students, and he advised them by increased efforts to show that it would be appreciated by them. He strongly urged the senior members to contribute to the education of the younger ones by reading papers, by giving information on matters connected with the profession and by supplementing the books in the library, and referred to the very generous gift of books by Mrs. Whitaker, the relict of the late Mr. W. W. Whitaker, architect, of this city. The younger members should by careful study and by passing the necessary examinations of the Royal Institute of British Architects qualify themselves to in their turn take office as presidents or vice-presidents of the Society, and to carry on the work which had for thirty years been going on, and had given the Society the first place out of London. The President afterwards delivered the prizes which had been awarded to the students for work during the past session. The principal prize of books, of the value of ten guineas, for the most satisfactory progress made by the Society's students in the architectural classes arranged by the council with the committee of the Technical School, was awarded to John Ormrod, and the second prize of five guineas was divided between William S. Beaumont and Alfred R. Parker. The other prizes respectively were given to A. E. Corbett, J. C. Dewhurst, Isaac Taylor and T. W. Hoolley.

The Reservoir at Osgodby, which supplies Scarborough with water, burst during Sunday night, and emptied itself of four million gallons of water. The reservoir is an old one, having been rebuilt in 1857. It is thought that 500*l.* will cover the damage. Apparently the concrete bottom of the reservoir has been forced out, and the water has escaped through the foundations without showing any trace. The water supply of Scarborough will not be affected.

MANX NAMES IN CUMBRIA.*

WE have often heard, since the days of Worsaae, that our district owes its population mainly to the northern Vikings, who infested the Irish Sea in the ninth and tenth centuries. It has been thought by Mr. Robert Ferguson, Mr. J. R. Green, our president, and other writers, that they came into the Solway and Morecambe Bay from headquarters in the Isle of Man. That theory may find support from a comparison of some Manx place-names with similar names in Cumberland and adjacent parts.

A few analogies have been noticed in print. The Rev. T. Ellwood mentions the two Fleshwicks, from *Fles*, in Icelandic, "a grassy place," and *vik*, "a creek." In his book on "The Surnames and Place-names of the Isle of Man," Mr. A. W. Moore compares:—

- I.O.M. Piel, with our Pile-of-Fouldrey.
- " Scarsdale, with our Scarfgap (*Skardh*, notch, paths).
- " Cammall, with our Camfell (*Kambr*, comb).
- " Colby, with our Colby (*Kollr*, hill top).
- " Surby, with our Sowerby (*Saurr*, muddy).
- " Kirby, with our Kirkby (*Kirkjubær*).

And Mr. Moore remarks that, of the Scandinavian elements which are common in our local names and dialect, some, namely, Haugh, Dale, Fell, Garth, Gill, Wick, Way (*vagr*), Ness, Toft and Thorp, are found in the island; while some, namely, Thwaite, Beck, With, Tarr and Force, are absent, from which he infers that the Isle of Man is less purely Norse and more Danish than Cumbria. But his book, with its full account of Manx names, gives us material for carrying the comparison further. There are three classes of words to consider:—A, Celtic; B, Scandinavian; C, mixed, the last class containing some curious examples of loan words from the Celtic to the Scandinavian.

A.—Celtic Names.

The Celtic words common in the Isle of Man when the Vikings became Celticised are rare with us, where the settlers kept their own tongue until they became Anglicised. Carrock and Cark match the Manx Carrick, "rocky"; Glencoin, "narrow valley," resembles Nascoin, "narrow waterfall"; Morecambe and Cambeck are like Glencam, with a common element—*cam*, "crooked"; our Crummock, though commonly interpreted Crumbeck, may be the same with the Manx and Galloway Crammag, "cliff." But most of our Celtic names are Welsh, since Cumberland was the land of the Cymru, and the earlier Gaelic element was partly crowded out, though traces of it returned with the Viking settlers, as I think to show.

Before their age, however, we have a few Gaelic importations. For just as the Irish monks preceded the Vikings in the Hebrides and in Iceland, so they did in these parts, no doubt using the Isle of Man as a stepping-stone across the sea. The Manx church of St. Bridget, Kirkbride, matches our Kirkbride and Bride Kirk; there is Kirksanton in both districts; and perhaps St. Sunday's Beck and Crag in Westmorland may be explained by the Irish Saint Sanctan; for in Domesday Kirksanton is written Santacherche and Santon is Suntun, which bridges over the transition from *Sanctan* to *Sunday*.

The Manx "kseeills" have Cumbrian analogies in Gilcrux and Gilcarron; and perhaps in two old names, Gilmartyne ridding prope Crofton (*temp.* John), and Gilmighel croft, near Pennington (*temp.* Ed. III.). All these churches and cells are near the coast, where such missionaries might have settled. St. Patrick himself, to whom there are dedications in the Isle of Man, is commemorated in Waspatrick (*temp.* Ed. I.), his wath over the Wampool; and on the same Roman road at Askpatryk (*temp.* Ed. III.), perhaps embalming some otherwise lost tradition of an ash tree under which he preached; as at Patterdale is the well where he is said to have baptized. In the Isle of Man also we find Ashtree and Well connected in Chibber Unjin, when the tree was formerly dressed with votive offerings. This custom, too, akin to the German Christmas trees, seems to survive with us; a great oak tree overhanging a fountain at Satterthwaite was dressed with crockery and coloured rags on Maundy Thursday a year ago, and another at Hawkshead Hill.

But these church names belong to an age before the Vikings came. They brought their own heathen worship, of which we find traces in both districts. And this leads us to the second class of words, namely:—

B.—Scandinavian Names.

In 1134, Bertrannus de London was one of twelve monks who, with their abbot, Gerald, founded Calder. The Rev. A. G. Loftie, in his guide to the abbey, remarks on the strangeness to this exiled Londoner of his new life and surroundings among rough neighbours and brethren, north countrymen all. But

again (*temp.* Ed. III.), William de London neglected to pay his "thrive" to St. Nicholas's Hospital at Carlisle; and the Testamenta Karliolensia show that the "de Londons" were a family of some local importance, without any suggestion of a connection with the great city. Now we all know places whose names are derived, like similar names in Denmark, Sweden and Iceland, from the *Lundr* or sacred grove of the Northmen:—Lund, near Whitehaven; another near Ulverston; Hoff Lund, near Appleby; and the Lound, near Kendal. But in the Isle of Man there is a Little London—for *Lundinn*, "the grove." This name suggests that we may look for the "London" of Friar Bertram not far from his first monastic home at Furness and for the "London" of farmer William in the land of Carlisle; for the difference is merely grammatical, as the Manx name seems to show.

Of this second class, all the Manx names can be matched in our district. Some are identical, as Ramsey, *Hramnsey*, "Raven's Island"; and Raby, *Råbær*, "nook farm." The termination "by," it may be remarked in passing, is by no means a test of Danish settlement. It is common in Iceland, and is quite good Norse. The terminal *r* is merely the sign of the nominative, and it was dropped after a time in pronunciation, like the parallel Latin *s* of the nominative, and it disappears in inflexions. Thus, "*ulfr*, his farm," is *ulfsbær*; Ousby, his water—*ulfsvatn* (*v*, pronounced in early times like *w*, and *vatn* sometimes written *vatr*). So Ulvrestune, of Domesday, must be for *ulfars-tún*, the enclosure of an early settler, Ulfarr. The popular pronunciation "Ouston" perhaps keeps a reminiscence of the later and greater Earl Ulfir, being the true equivalent of *ulfstún*. Some of these names are practically identical:—Cringles (Isle of Man) and Crinkle Crag (*Kringla*, "circle"); Jurby, formerly Ivorby and Ireby (Ivar's farm); Kneebie and Knipe (*gnípa*, "peak"); Sulby and Soulby (*Sölvi's* farm).

Some, again, are identical in one of the elements of which they are compounded. To take a few samples, some of them from old forms of Manx names:—

- I.O.M. Altadale and our Alps (*Alpt*, "swan").
- " A[s]mogarry and our Osmotherley (*Asmundar-gardhr-ljá*).
- " Brackabroom and our Brackenber (*Brekka-brín-bardh*).
- " Clet Elby and our Cleat How (*K'lettr*, "rock").
- " Clytts and our Cleator (*K'lettar*, "rocks").
- " Colden, with our Caldfell, &c. (*Kaldr*, "cold").
- " Dalby, &c. and our Dalton, &c. (*dalr*, "dale").
- " Foxdale and our Foxfield (*folks*, "of the people").
- " Grauff and our Orgrave (*aurr-gröf*, "clay-pit").
- " Hæringstad and our Harrington (*Hæring*, "hoary," proper name).
- " Hegness and our Honister (*Högna nes-staðhr*).
- " Keppellgate and our Keppelcove (*Kapall*, "nag").
- " Meary voar, &c. and our Merry hall—Mere beck (*mærr*, "borderland").
- " Orm's house and our Ormside (proper name).
- " Oxwath and our Oxenfell, &c. (*Oxavadh*, *öxnafell*).
- " Rozefell and our Rosthwaite, &c. (*hross*, "horse").
- " Sandwick, &c. and our Sandscale, &c. (*sandvick*, *sandskáli*).
- " Sleckby and our Harrowslack, &c. (*slakki*, "slope").
- " Staynarhea and our Stennerley, &c. (*steinn*, "stone").
- " Strandhall and our Strands (*strönd*, pl. *strandir*).
- " Swarthawe and our Swarthmoor (*svartr*, "black").
- " Warfield—Wardfell and our Warthole, Warwick (*vardha*, "beacon").

From one of such names in the Isle of Man light is perhaps thrown on a curious series of names in our district. Mr. Moore explains *Brausta* (old form of *Braust*) as *Brautarstadhr*, "roadstead." *Braut* in Icelandic means a road broken or cut through rocks or forests, as distinguished from *vegr*, *stigr*, *gata*, "path, track." *Brautarmót* is "a meeting of roads," as *Bekkjarmót* (*Beckermot*) is "a meeting of becks"; and to the settlers in Cumbria the Roman roads must have been a great and remarkable feature of the country. When they found a passage through the rocks and forests of Patterdale, it is no wonder if they called the tarns—by which it wound and at which it threw off a branch to the wonderful High Street—*Brautarvatn*, Brotherwater or Broaderwater—so called long before the traditional brothers were drowned there.

Again, Butterilket, the farm in Eskdale just under the Roman fort, was written Brotherellkell (*temp.* Eliz.), Brotherulkul (*temp.* Hy. IV.), Brutherulkil (*temp.* Hy. III.), suggesting that the original Norse name was *Brautarhöllkeld*, "road-hill-spring," where they stopped for a drink before taking the steep gradients up Hardknot. *Brautarhöll*, or a *Brotthöll* (*Brott* being a common form in compounds), reappears in Brott-hole-hill, in the Caldbeck neighbourhood (*temp.* Hy. III.); *Brattah* or *Brotto* in Legberthwaite may be the same, or else *Brotthaugr*, "road-howe."

* A paper by Mr. W. G. Collingwood, M.A., read at a meeting in Douglas of the Cumberland and Westmorland Archaeological Society, and published in the *Isle of Man Times*.

It is interesting to find that the degradation of "Brother-ilket" into "Butterilket" is matched in Norse philology by that of *Brautarsteinar* into *Bautasteinar*, the popular name of the "road stones" or monuments (see Cleasby and Vigfusson, s.v.). This may explain Butterlip-howe by the Roman road of Grasmere as a natural and pastoral improvement on *Brautarl-hidhhangr*, "road-gap-howe," a truly descriptive epithet, while Buttermere and Butterwick are perhaps better explained by *Búðir*, "booth"; *Búðharveggr* is good Norse for "booth-wall," and practically identical with the country pronunciation of Butterwick.

This confusion between *Brautar* and *Bauta* may have been helped on—and it may be remembered—by the fact that the Irish for "road" is *Bothar*. For it is well known, that the Northmen on the shores of the Irish Sea lost so much of their pure nationality, that this district of Galloway got its name from the Gall-gaedhil, the mixed Gall and Gael, Vikings and Celts. Even those who emigrated to Iceland took with them much Celtic blood and many Celtic words. Thus, *Njall* and *Kjartan* and *Kormak* are Irish of Norse Icelanders; *pollr* "pool," *brók* "breeches," and *poki* "bag," are Celtic loan words in Icelandic literature. Now I think it can be shown that the Norse settlers brought Celtic loan words into Cumbria, and that they brought them from the Isle of Man.

C.—Mixed Names: Manx Loan Words.

1. In the Edda is found a word *Korki*, from *korkey*, Irish and Gaelic *coirce*, "oats." Now Corby in Cumberland was written (*temp.* John, Ric. I. and Hy. I.) Corkeby and Korkeby, i.e. *Korkabær*, "oats-farm." A corresponding name in purer Norse is Haverthwaite, *Hafrathveit*. Similar formations are Ruthwaite and Ruckcroft (*temp.* Ed. VI. Rewcroft) from *rúgr*, "rye"; Rusland, however, was (*temp.* Ed. III.) Rolesland, *Rolf'sland*. Again, Bigland and Biggar (*Bygg-gardhr*) from *bygg*, "six-rowed barley"; the four-rowed barley, *barr*, may be found in Barton; so from *Korki Korkahlidh*, "oats-fellside"; the termination being degraded on the analogy of Ainstable (*temp.* Hy. I. Ainstapellith), i.e. *Einstapihlidh*, "fern-fellside," for the Norse *Ein* was pronounced like our "Ain," and *Steinn* like "stane." Again Corney (Cumb.) = Corna (I.O.M.) = Kornsa (Icel) "Cornbeck," so that the Cocker, on the banks of which is Cornhow, may perhaps be interpreted *Korká*, "oats-beck."

2. *Hnukr* is "Knoll, peak" in Icelandic, but uncommon, evidently from the Manx *Knock*, Irish *cnoc*. We have it naturalised in Knockpike and Knock Shalcok (*temp.* Ed. II.). Next we may take a set of words which are not found in the Icelandic dictionary, but are so used in Cumbria as to leave little doubt that they were brought over by the Celticised Vikings; and their form seems to be distinctly Manx, in some instances at least.

3. Peel is Manx for a "fortified town"; a word which, though not found in Icelandic literature, was certainly adopted by the Norse in Cumbria, and used to considerable purpose.

4. *Parak* occurs in our dialect, a loan word from Manx and Irish *pairc*; though in Iceland it appears only as a nickname.

5. *Dub* has in Icelandic nothing nearer than *djúp*, "deep sea"; while *dubbyr*, *dob* (Manx) means "a small pool" in our sense.

6. The Manx *Spooyt* of a waterfall, seen in our Gill Spout, &c., has no analogue in Icelandic. The nearest form is the cognate Aryan root *spýja*, "to spew."

7. The Scrow at Coniston is a turfey hill, an outlier of the Old Man. "Scrow" in our dialect means "a crowd," from Icelandic *shreiddh*, "shoal" of fish, &c.; or else "scrimmage," to which it is doubtless akin. But neither of these explain the hill; whereas the Manx for "turf" or "sod" is *scrah*.

8. Now to recur to the road-names. For the Irish *bothar* the corresponding Manx is *Bayr*. In the Isle of Man is a place called Baregarrow, which Mr. Moore interprets "rough road." On the Roman way between old Carlisle and Maryport, we have Bagrow ("Baggerah"), which may possibly indicate that the invaders found that bit of Roman paving more cobbly or more worn than usual. There is, however, a "Baggrave" on Watling Street in Northumberland. *Bayr* may also account for Barbon in Domesday, Berebrune, "the road-well," on the Maiden Way. Bardsey is in Domesday, Berretseige, *Bayr-hæds-egg*, the edge or cliff at the head of a road called the Red Lane, through Furness. And close to the spot where the road from Lancaster came upon the lands there was Bare (*sic* in Domesday). I think these names are hardly explained by the Icelandic *Ber*, in compounds *berja*, "berry," or by *berr* "bare"; so that we may, perhaps, consider *Bayr* as a loan word; and if so, not from Ireland, but from the Isle of Man.

In a third and final subdivision we must put two which are found neither in Norse nor in Manx, and yet may have been loan words borrowed by the Norse from the Manx. That is to say, words which must have been current in the ninth century which are now obsolete there and preserved only in place-names; and these words must have been brought by the Norsemen into Cumbria though not into Iceland.

9. *Glaise* is Irish for "stream," and Mr. Moore considers that its Manx equivalent was *glas*, in Douglas, "black stream." We may find the same word in Glasson and Glassonby (both *temp.* Hy. I.) and in Gleaston, the Glasserton of Domesday, Ravenglass (*temp.* Ed. I.) was Ranglass, a curious form, because most names in early writing become longer and fuller; this is an exception, surely not without cause. The old Nicolson and Burn derivation was *Renigh-glas*, "green fern"; but a much closer equation would be the Manx *Raun-glas*, "seal-river," nearer than the Irish *Ron-glaise*; and seals must have been common enough on that coast in the tenth century.

10. The Irish *boireann* is not found in Manx, except in a place-name, and not in Icelandic at all; but it seems to have been a loan word, judging from its occurrence in our dialect. It means properly, "rocky land," but, says Mr. Moore, "it is a name actually applied to an old earthen fortification."—Borrane Balebly. Now, in our district, *borran* is also used for rocky land in general, but as a proper name it attaches especially to land covered with ruins, e.g. Borrans Ring, the Roman camp at Ambleside; High Borrans, near Windermere, is close to the Hugill settlement; Low Borrans is near to the spot where the Roman road crossed Troutbeck. Indeed, the name is frequent on the track of the Roman roads (see, for example, Cornelius Nicolson's "Annals of Kendal"), while there are innumerable natural rocky places to which it does not attach.

There is a Borrans Hill House on Burns Hillside, near Subergham, which seems to show that *Burns* is *Borrans*. Barnscar can hardly be anything but *Borran-scar*, from the heaps of remains found there. Burnmoor, *borran-moor*, is a place where circles are found; Wyebourne is near a British camp, east of Shap; Garbourne is on the High Street, south of Ill Bell. In these cases we have the loan word compounded with a Norse element, and it may be suggested that "burn" in our district is frequently, if not always, equivalent to *borran*.

It has often been noticed that our dialect does not use "burn" for "stream," as in Scotland and Northumberland. "Burn," from *berne*, is an Anglo-Saxon word, not occurring in Norse, in which the nearest form is *brunnr*, "a well," as in the Icelandic proverb, "Late to bar the *burn* when the barn is fallen in," referring to a well with a gate, such as we see near old-fashioned cottages. The Scotch and Northumbrian "burns" were so named by Anglians two or three centuries before the Northmen settled our district. The old Norse word was *bekkr*, but this was antiquated in Iceland by the time the sagas were written, and even in the tenth century they used *lækr* for *bekkr* in local names. This shows that our district was settled and named, and that a local dialect of pre-Icelandic Norse was formed by the early part of the tenth century. We keep several words that the Icelanders lost. They had a proverb, "öl heitir með mönnum, en með Asum bjór"—"Ale is right with men, and with gods beer," meaning that "beer" was the ancient poetical word; ordinary folk asked for "ale." A parallel proverb said of barley, "*bygg* it is called by men, and *barr* by gods," *barr* being the older and less familiar name for the less productive sort, superseded by *bygg*. But, as we have seen, both words remain with us, in Bigland and Barton. Tilberthwaite, however, is not from "tilling beer," as some one has suggested, but from *Tjalds-borg-thveit*, "tent-fort-field," seen in Tildesburghthwait (*temp.* Ric. I.), like *Tjaldastadhr* (Icel.).

The use of old forms of writing is strikingly shown in the name Burneside, which used to be derived from *burn*, "a brook." It was written (*temp.* Ed. III.) Brunoleshefd, Bronolvishead; and (*temp.* Ed. I.) Brunoleshefd, Bronolvishefd. The valley of Sleddal Bronnolf, and one Roger de Bronnolf are mentioned (*temp.* Ed. I.) and Sleddal Brunholf (*temp.* Hy. III.), showing that Burneside (Burnishead) was named from some early settler *Brinölvi*, "the wolf-browed," a recognised Norse appellation. To the same name, if not the same person, may be referred Brunnelscroft, Middleton.

But in other "burns" the case is different. Greenburn is the valley that opens at the green borran, which has been identified by Mr. H. S. Cowper as our lake district Tynwald. "Greenburn-beck," not "Green-burn," is the stream that flows past it. So Wythburn may be properly not the name of the stream, but of the ground by which Wythburn-beck runs. "Wyth" is *vidhr*, "wide," like *vidhlendi*, "wide lands," &c.; or *vidhr*, "withy," like *Vidhidallr* in Ireland, "willow-dale." And the land is not only unusually rocky, but it is also traversed by a great Roman road, marked by the names Stanwick (*steinvegr*, "stone road" paved with boulders), and Stenkin Nook (Stanwick-ing, "meadow"); and there are traces of ruins which, at the time of the settlement, must have been striking enough in their extent to be called the "wide-borran," or so overgrown as to suggest the name "withy-borran." In a word, the original Cumbrian Norse dialect called our streams *bekkr*, or *á*, and perhaps sometimes *lækr* (as in Lickle for *lækjargil*?) but never *burn*, which is the Manx loan word *borran*; except in those outlying parts of our district where pre-Norse—i.e. Anglian—names survived.

These ten loan words, if the derivations be accepted, and in

any case the parallelism of so many Manx and Cumbrian place-names, illustrate the interest—it might almost be said the necessity—of going beyond the bounds of our own district to compare the antiquities of our neighbours; and they rivet new links in the chain of evidence which binds us to the Isle of Man in the history of a thousand years ago.

THE STRENGTH AND RESILIENCE OF STRUCTURAL CAST-IRON.*

THE working qualities of structural castings are of extreme importance, so much so that the necessity for these qualities goes without saying. Furthermore, these qualities can be tested, and are tested, of necessity in the finishing of the castings for service. Any failure of the working qualities is immediately discovered by the machinist and corrected by the foundryman. The strength and the toughness of the castings, however, are two qualities which are not usually determined at all except by such incidental indications of strength and toughness as come from the breakage of these parts in practice under loads or shocks which they were assumed to be able to resist. This indication is, of course, a very inadequate one, and gives at best no measurable test of the strength or toughness of the iron.

In this paper the author will undertake to show the necessity for these qualities, and how they may be determined by actual tests. He will further try to show that strength and toughness are not identical, and that the one does not give any indication of what the other may be. Thus, a very strong iron may be a very brittle one, and, on the other hand, a very tough iron may be comparatively weak.

The Strength of Cast-iron.—Cast-iron is not usually used in structures to carry tensile stress alone, but generally used for columns and beams. In machinery castings, however, where all the parts are made of cast-iron, some parts are subjected wholly to tensile stress. There are three kinds of strength therefore of cast-iron, which may be determined by actual tests, namely, tensile strength, compressive strength and strength in cross bending, as a beam. When a cast-iron beam or any cast-iron form is broken in bending, the fracture always occurs on the tension side of the member, and hence the failure is one in tension. In the case of cast-iron columns, provided the load is symmetrical and the column is equally strong on all sides, the failure would be one in compression. It so happens, however, that the tensile strength of cast-iron is a good measure of both its cross-bending and of its crushing strength—that is to say, that cast-iron which is strongest in tension is likely to be strongest in compression and in cross bending. All kinds of strength of cast-iron therefore may be determined by a tension test. It may also be determined by a cross-bending test. The tension test has one advantage over the cross-bending test, inasmuch as the whole length of the tension test specimen is subjected to the same stress, and if there be a flaw anywhere in the entire length of the specimen, failure will occur at that point, and hence the weakness of the specimen will be shown wherever this weakness may occur. In cross-bending tests, where the bar is loaded in the middle, the tendency to break is greatest at the centre, where the load is placed, and if a flaw occurs near one end, it would not be discovered by the bar rupturing at that point. Hence we may say that the tension test is a better test to discover any possible flaws which may be in the specimen, but the cross-bending test is probably better for determining the strength of the metal, since, in the latter case, the rupture must occur near the centre of the beam, and if this portion of the beam be free from flaw the true strength of the metal is determined. It is also much easier to make a test of cast-iron in cross bending than in direct tension, and furthermore a cross-bending test furnishes the means of determining the toughness of the iron, as will be explained later, and therefore in what follows cross-bending tests will be taken as a standard method of determining both the strength and toughness of the iron.

Cross-bending Tests.—The most convenient form for a test specimen of cast-iron for cross bending is a rectangular cross section about 24 inches long. The size of the cross section should have some relation to the thickness of the webs or parts in the structural forms into which the metal is run, and for the strength of which the tests are made. Thus, if the iron is to be used in forms where the thickness of the metal is about 1 inch, the test specimen should be made about 1 inch square. If, however, the metal is to be used in parts the thickness of which is not more than $\frac{1}{2}$ inch, then it would be well to make the test specimens $\frac{1}{2}$ inch thick and perhaps $1\frac{1}{2}$ to 2 inches wide.

In the case of stove iron the test specimens should not be more than $\frac{1}{4}$ inch thick and about 2 inches wide. The length of the specimen is immaterial, and should be such a length as

is adapted to the testing machine or apparatus. The cross section of the test specimen should, of course, be uniform from end to end; that is to say, it is of the same size throughout.

The same care should be taken in the moulding and casting of test specimens as would be taken in any regular casting where sound and perfect work is desired. It would usually be cast horizontally, but with due precautions, as in the interception of the slag, in the escape of the air, in the smoothness of the sides and the perfection of the corners. It should be so moulded as to free itself readily from the sand, and should be tested without planing down.

In testing such a bar it should be supported on knife edges near the ends, these knife edges being at a definite distance apart. The distance between these knife edges being the length of the beam, so far as the test is concerned, any overhanging ends of the specimen beyond the bearings have no effect on the strength of the beam. This specimen is then broken by placing a load at the centre, preferably by means of another knife edge, and this load applied slowly and uniformly and without shock. About the only way to do this properly is by means of a screw turned steadily and very slowly. There are various cross-bending testing machines on the market, the principal ones being manufactured in Philadelphia. The modulus of rupture of cast-iron in cross breaking corresponds to the tensile strength of the iron, and if the iron were perfectly elastic up to the point of rupture this modulus of rupture would be the same as the tensile strength in pounds per square inch, but since cast-iron takes some permanent set before it breaks, the theoretical formula no longer applies, so that the computed modulus of rupture as determined from cross-breaking tests is found to be always very much larger than the true tensile strength of the cast-iron, its average value being from one and a half to twice as much as the strength per square inch in tension. If the cast-iron has a tensile strength of 2,000 lbs. to the square inch, its modulus of rupture in cross bending will be therefore from 30,000 to 40,000 lbs. It is common to assume that a tensile strength of 20,000 lbs. corresponds to a cross breaking strength or modulus of rupture of about 36,000 lbs. per square inch. To find this modulus of rupture from a cross-breaking test on a rectangular bar we use the following simple formula:—

$$f = \frac{3}{2} \left(\frac{Wl}{bh^2} \right)$$

where f = modulus of rupture in cross bending in lbs. per square inch, W = load at centre of beam in lbs., l = length of beam between bearings in inches, b = horizontal breadth of beam in inches, h = vertical height or depth of beam in inches.

It is much better to use this formula and compute f from the cross breaking weight W , and the dimensions of the bar b , h and l , than to use some thumb rule, as, for instance, that a bar 1 inch square and 12 inches long should carry a load of 2,000 lbs. at the centre. This would give a modulus in cross breaking of 36,000 lbs., which indicates a very fair quality of cast-iron, so far as strength is concerned, but if the specimen should prove to be a little more than 1 inch square, or a little less, there is nothing in the specification to show by how much the loads should vary to compensate for this change of size. Whereas, if it be specified that the modulus of rupture should be 36,000 lbs., that could be determined from the above formula very easily whatever the dimensions may have been. In fact, b and h should always be measured to the nearest 1-100th inch, and, of course, the castings could not be made of any given size to anything like this degree of accuracy.

In all cross-bending tests of cast-iron some means should be provided for accurately measuring the deflection of the bar up to the point of rupture. This can only be properly done by the aid of some kind of attachment to the testing machine itself. These deflections should be measured to the nearest 1-100th inch. The use of the deflection is to enable us to compute the resilience or elastic spring of the iron, as will be explained below.

Resilience of Cast-iron.—Resilience is a scientific term which signifies the toughness or the ability of the material to resist a shock or blow. It is not strength, neither is it deflection, but it is a property representing these two qualities combined. Thus if the total breaking load be multiplied by the total deflection of the beam, and this product divided by two, the result is the resilience of the beam in inch pounds, provided the load were measured in pounds and the deflection in inches. This product varies directly with the form and volume of the beam, irrespective of its dimensions, so that if the half product be divided by the total number of cubic inches in the beam, the result represents the resilience of the iron for a rectangular beam in inch pounds per cubic inch of metal. This is an absolute measure of the resilience or toughness of the iron, but it is easier to weigh the specimen than it is to compute its volume in cubic inches. Hence we may find the resilience of a rectangular beam per pound of metal by dividing the total resilience by the number of pounds in the specimen, just as before we found it per cubic inch by dividing by the number of cubic

* A paper read by Professor J. B. Johnson, of St. Louis, Mo., before the Foundrymen's Association.

inches in the specimen. The writer prefers this latter method, and therefore he recommends the following:—

RULE.—Multiply the breaking load in the middle of the beam by its deflection at the time of rupture and divide the product by twice the weight of the beam in pounds.

The result should be not less than 20 for ordinary cast-iron, and may be as high as 50 for the best quality of refined cast-iron, such as is commonly known as gun metal. For a very good quality of machinery castings, or such as should be used in railroad work, car construction, car wheels and the like, where the metal is subjected to severe shocks and blows, a result obtained as above of not less than 30 should be required. For stove iron a result not less than 40 should be specified.

In using the above method of making tests and computing the resilience of rectangular cast-iron bars there is no necessity of carefully measuring the cross section of the bar or its actual length. It should, however, be supported very near its ends, if the whole weight is to be taken in computing the resilience. It is also necessary to measure the deflection accurately. The only data, therefore, which need be taken are the weight of the bar in pounds, the breaking load in pounds and the deflection in inches. Applying the above rule to this data, we obtain at once the measure of the toughness of the iron, which has been described as including both the strength and the deflection. If it is desired to know the strength alone, then it is necessary to measure the length, breadth and height, and compute the strength per square inch by the formula—

$$f = \frac{3}{2} \left(\frac{WL}{bh^2} \right)$$

This value of f is called the "modulus of rupture" in cross breaking, and is about $1\frac{1}{2}$ times the real tensile strength.

Tension Tests.—In all tests of cast-iron in tension the specimen should be cast round, free from all defects, and then turned down in a lathe throughout its entire length, the middle portion being reduced to a somewhat smaller diameter than the ends. It is necessary to turn down the end portion in order to allow the specimen to fit the grips perfectly, and the middle portion should be made somewhat smaller to insure against breaking in the grips. If the specimen be made $1\frac{1}{2}$ inches in diameter, and the rough casting turned down to $1\frac{1}{8}$ inches at the ends, and the middle portion reduced to 1 inch in diameter, we would have the ideal tensile test specimen for cast-iron. The reduction from the end to the middle portion should be by a curved shoulder and not by an angular offset, in order to prevent rupture at this point. The specimen should be some 12 to 16 inches long, and the ends which are gripped should be left about 3 inches long, the remaining portion being turned down to the uniform diameter of 1 inch. Such a specimen can only be broken upon a regular tension testing machine, such as few foundries have in their outfit, and hence these tests are not so well adapted to common practice as the cross-breaking tests described above.

Cross-breaking Testing Machines.—Several concerns manufacture cross-breaking testing machines which give indications of the deflection, such as are required in the application of the rule given above for determining resilience. In these tests it is very necessary that the load be put on slowly and with perfect uniformity, and this is accomplished in all these machines by means of a screw. Every foundry which undertakes to turn out a first-class grade of cast-iron should have one of these cross-breaking testing machines in its outfit, and should study the character of all its mixtures by means of such tests as have been described in this paper, these tests being for both strength and resilience.

It must be noted that both the strength and the resilience can be determined from the same test. Having measured the length, breadth and height of the bar, and determined the breaking load, we can compute the breaking strength as described above; also having weighed the bar and determined its breaking load and its deflection, the resilience in inch pounds per pound of metal can be determined so that a single test in cross breaking fixes both the strength and the resilience or toughness of the iron. It must not be forgotten that these two qualities are entirely distinct, and must not be mistaken the one for the other. Thus, one mixture may be very strong and brittle, and another comparatively weak, but very high in resilience. It is not impossible, however, to obtain both great strength and high resilience from the same mixture, and this, of course, is the ideal kind of cast-iron. Such iron offers the greatest resistance, both to dead loads and heavy strains, and also to such shocks and blows as it may receive either in actual practice or from some accident.

Because the resilience of cast-iron has not heretofore been commonly studied or even thought of as a measurable property is no reason why it should not be carefully examined into. This term is now coming into common use, and practical men must accustom themselves to its use and understand its meaning. If a manufacturer of cast-iron would obtain one of the testing machines described above and carefully attend to the tests for resilience, and compare his results with his mixtures, he could

soon convince himself of the significance and importance of the resilience tests, and would probably never consent to grope in the dark in regard to the qualities of his products, as nearly all foundrymen have been accustomed to do. The character of his iron would then be no longer a matter of opinion, but would be determined absolutely, so that the proprietor could judge for himself of its quality from these tests, and not have to rely implicitly upon the mere opinion of his foreman or superintendent. Furthermore, such tests as these cost very little, and any intelligent workman or clerk can be taught to make them and the accompanying computations.

To make such tests valuable a test record-book should be kept, in which the mixture should be put down and the results of the tests alongside, and these carefully preserved. Such a record-book of mixtures and corresponding tests would soon become of great value as part of the capital stock of the concern, and this knowledge would not disappear from the establishment when the superintendent took his departure, neither would there be any personal element in it, and it would in no sense be a matter of opinion, but would be an absolute measure of the quality of the iron resulting from certain mixtures, which knowledge would be the common property of the entire establishment. There is probably no other way in which a small sum of money can be made to produce such valuable and permanent results in the carrying on of any foundry as in the making of such tests as here described, and the careful preservation of the records.

Drinking Fountains.

SIR,—I am desirous of knowing the locality of a drinking fountain with clock tower above in good Gothic style. If any correspondent will be kind enough to give information as to where any such may be seen it would greatly oblige.—Yours obediently,
W. M.

GENERAL.

Mrs. Long, widow of Mr. Edwin Long, R.A., has offered to the city of Bath, her husband's native place, his picture, *The Raising of Jairus's Daughter*, which is valued at about 5,000*l*.

Canon Wise, a Cornish clergyman, a large contributor to the Truro bishopric and cathedral funds, has given a donation of 5,000*l*. towards the erection of Truro Cathedral nave.

M. Alfred Delaunay, whose etchings of French cathedrals and views of Old Paris have been appreciated, has died at Nanteuil in his sixty-fifth year.

A Statue of the late Sir William Pearce, the shipbuilder, by Mr. Onslow Ford, A.R.A., was unveiled in Govan on Saturday by Lord Kelvin. The money was subscribed by the shipbuilding and engineering operatives of the district.

The Late Mrs. Lyne Stephens bequeathed three pictures to the National Gallery and some rare examples of old furniture and china to the South Kensington Museum.

The Old Palace of the Bishops, in Neville's Court, Fetter Lane, Chichester, is about to be demolished.

Mr. Woolrych Perowne has obtained promises of lectures to the members of his educational tours to Rome and Palestine from Mr. Oscar Browning, Canon Evans, Professor Lanciani, Mr. Bliss and others. The Bishop of Peterborough will lecture on "Rome of the Renaissance" and "The Influence of the Popes on Roman Architecture."

The Rebuilding of the Institution of Civil Engineers will not affect the place of meeting, as such arrangements have been made as will allow of the theatre and reception-rooms under it being retained for use during the approaching session.

General Moberley has been appointed by the London School Board as their representative to attend the conference proposed by the Architectural Association, for the purpose of considering the question of the practical training of London workmen engaged in the building trades.

A Picture by Mr. J. Coutts Michie, A.R.S.A., *Sunshine and Shadow*, which was exhibited at the Royal Scottish Academy, has been purchased for one of the Vienna galleries.

Mr. Cranage is delivering a course of lectures on "Gothic Architecture in England" at the Subscription Library Lecture Hall, Sunderland.

The Aberdeen Art Gallery have received gifts of busts of Scott and Burns from Mr. D. W. Stevenson, and of the civic badge and chain of office belonging to the Provosts of Old Aberdeen, from ex-Provost Sinclair.

The Architect.

THE WEEK.

THE ozone or some other element in the air of seaside towns must be a wonderful disinfectant, for the defects which are found in many of them if they existed elsewhere would be fatal to the inhabitants. Only a few years have elapsed since a drainage system was introduced in Margate, and although the town was overcrowded during a part of every year the death-rate was rarely abnormal. The latest revelation of defects comes from Eastbourne. That fashionable watering-place has not gained favour without the expenditure of enormous sums of money on its improvement. About a year ago a sum approaching 30,000*l.* was expended on drainage. It is, however, far from being considered perfect. The report which Mr. HENRY LAW has prepared for the Town Council is convincing that the drainage is altogether inadequate, and that an outlay of 75,000*l.* must be faced. It might be imagined from reading the document that by some error the original plans were reversed, for the main drains instead of having increased diameter as they approach the outfall become diminished. One of them, which near the railway station has a calculated discharge of 6,258 cubic feet per minute, at the outlet has a capacity of only 915 cubic feet. It is no wonder that in the low-lying portions of the town the houses are often flooded.

THE Thirlmere Waterworks are not complete, but a conduit extends from the lake to Manchester, and since Saturday last a supply is available in the city. When the difficulty of obtaining water in Leicester is considered, as well as the inconstant quantities on which other towns have to depend, the people of Manchester have reason to congratulate themselves on the possession of a reservoir which will enable them to be indifferent to the driest weather during at least four months. The works have, no doubt, cost a large sum, but the blessings which a daily supply of 75,000,000 gallons of water can confer would by Londoners at least be considered cheaply purchased for three millions of money. Birmingham is expending a larger sum on a supply which will need the transformation of the Elan Valley into a reservoir to contain it. It may be asked, When is London's turn to arrive? The question, Where is a supply to be discovered? deserves prior consideration. The affluent catchment basins that are suitable are being seized by provincial towns. No doubt they are securing far larger quantities of water than will ever be needed for local purposes. That, however, will be no consolation when London discovers it must share the fate of the last comer in the scramble for water.

DURING their visit to St. Mary's Church, Long Stratton, the members of the Norfolk and Norwich Archæological Society were able to examine one of the two examples (the other is in Yaxley Church) of a "sexton's wheel" which remain in England. It is an open iron dual wheel 24 inches in diameter; each wheel is divided into eight sections, and each section adorned within on the periphery with a fleur-de-lis. Both wheels are bound together on one short axle, from which run narrow shafts to the circumference to meet in the handle by which the instrument was held. The Rev. W. H. SEWELL explained that this wheel was in former times occasionally used to determine the day from which to begin keeping the Lady Fast. There were two kinds of fasts observed in honour of the blessed Virgin—one movable, the other immovable. The latter was kept every Saturday. TYNDALL referred to the Lady Fast in his Exposition of St. Matthew, and to that allusion the Rev. HENRY WALTER appended a note, explaining that the Lady Fast seemed to have been a species of penance, whether voluntary or enjoined, in which the penitent had the choice of either fasting once a week for seven years on that day of the week on which Lady Day happened to fall, beginning his course from that day, or of finishing his penance sooner by taking as many fasting days together which would amount to one whole year. There were six Lady Days in the year—the Con-

ception, December 8; the Purification, February 2; Annunciation, March 25; Assumption, July 2; and Nativity, September 8. On which of the Lady Days was a person to begin fasting? Recourse was either had to lot or to the sexton's wheel, and a string was fastened to each of six holes, three in each wheel, to indicate the six Lady Days on which fasting was to commence. When the wheel was revolving the person who wished to consult it had to try and catch one of the strings. Bent radii in each wheel prevented their making a complete revolution. KIRCHMEYER, in a Latin poem, said:—"They keep a fast to MARY on a solemn day, which a wheel turned round and a thrown lot indicate; for every sexton hangs up his wheel in a church, marked round about with five or six days and with feasts throughout the whole year sacred to MARY. From each there hangs a long string to catch. If, therefore, a devotee of MARY comes and desires one day of the six to be given him by lot, the sexton makes the wheel revolve and bids the person catch the string as it goes round. Thus he knows the day on which to keep his stated fast." It might be supposed that from the time names were given to the days of the week men would be able to remember one of the seven, but the strange wheel or roulette-table was employed, we suppose, from a lurking belief that invisible powers would be interested in the selection of a fast-day and determine the most suitable.

ACCORDING to the latest papers received from Australia, a difficulty has arisen about the conditions of tendering for the proposed markets in Sydney. In order to see the plans and to be allowed to tender it was necessary for a contractor to pay a deposit of 300*l.* Another deposit of 2,000*l.* was to be sent with the tender. In addition, the successful competitor would have to enter into a bond for a sum equal to 5 per cent. on his tender. The members of the Builders and Contractors' Association are divided in opinion about the merit of the conditions. Some believe the deposits will have a prohibitive effect and enable one or two contractors to monopolise the work of the colony. Others maintain that at present a contractor often puts down four or five names of men as intending to compete, in order that he may have possession of the plans for an extraordinary time. By insisting on a large sum as deposit the Corporation were also likely to insure more careful tendering. A majority considered there should be a remonstrance, and a deputation accordingly waited on the Mayor. It was anticipated that some modification of the conditions would be approved.

MR. J. L. ROBINSON, R.H.A., who died on Friday last at Dalkey, co. Dublin, was distinguished among the Irish architects by his desire to co-operate with his English brethren. He was, we believe, the son of a photographer, and few amateurs possessed so much dexterity in the process. Year after year his skill was at the service of the members of the Architectural Association in their annual excursions, and in numerous other ways he displayed a willingness to serve. Mr. ROBINSON's name has been therefore familiar to architects throughout England, and he was respected by all who met him. In Ireland he gained esteem in public life, for he was from his training one of the most useful members of the Dublin Corporation, and he was for a long time chairman of the Kingstown Commissioners. Mr. ROBINSON was fortunate in obtaining the support of the Roman Catholic authorities, and several convents, colleges, hospitals, schools and charitable institutions were erected from his designs. He was in the prime of life, and his friends were justified in the expectation that there was a long and prosperous career before him.

THE first volume of the third series of the Sketch-book of the Architectural Association is about to be issued. During the past quarter of a century the Sketch-book has been most useful, both from the subjects of the plates and the opportunities which they furnished for friendly competition among the members of the Association. The new series will, we are confident, be no less serviceable, and we wish it success. The editors are of course desirous to have all the support they can obtain, in order to avoid the possibility of loss, and it would therefore be advantageous if intending subscribers signed the forms without delay.

BENVENUTO CELLINI.*

WHEN GOETHE decided upon a journey to Italy—he was then in his thirty-seventh year—he prepared himself for the understanding of the Renaissance period and its artists by a translation of the autobiography of BENVENUTO CELLINI. It was characteristic of GOETHE to endeavour to put himself in the place of a Renaissance master and to look at Italy as it were through the eyes of a man of the sixteenth century, and for that purpose there could be nothing more aidful than the book of the Florentine goldsmith. He might be called the ODYSSEUS of Art. CELLINI could well say of himself:—

Much have I seen and known; cities of men
And manners, climates, councils, governments,
Myself not least, but honour'd of them all,
And drunk delight of battle with my peers.

He was not one of the most illustrious men of the age of gold. It would be absurd to rank BENVENUTO with DA VINCI, MICHEL ANGELO or RAPHAEL, with BRAMANTE, BACCIO DELLA PORTA, TITIAN, VERONESE and others. He must stand on a different plane. But he saw more of the varieties of Renaissance life than greater artists, and from the value of the description he gives of the scenes in which he was an actor he has gained an amount of fame to which his works in metal did not entitle him. GOETHE could easily have grasped the character of the autobiography by one or two perusals, but he wished to utilise every sentence as a test of his knowledge, not merely of language, but of art and history. There were not many examples of Renaissance art available in Weimar for the elucidation of CELLINI's words, and with all his stoicism GOETHE owns that he suffered positive pain when day after day he discovered that a great part of the text was meaningless for him from that deficiency. GOETHE was too much of a realist to be satisfied with vague notions of the meaning of words. At all costs he insisted on knowing the things which they represented. Accordingly, when he heard there was to be an auction of Italian medals and coins in Nuremberg he bought the whole collection in the hope that some of them would serve his purpose. There were hundreds of examples, but unfortunately not one was modelled by CELLINI. The failure stimulated GOETHE to further exertions, which long before he attained acquaintance with CELLINI's work made him happy, for, as he said, in that way he laid the foundation of a branch of knowledge that was quite new to him. GOETHE's example suggests what can be done by any earnest student who cares to "get up" a book thoroughly. It may not be a work of genius, but it can be made to serve, like the bolsters and mattresses of the pugilists, to develop power.

CELLINI's book exemplifies that defects are often more serviceable to the world than virtues. Probably there never was a man who was more conceited. If he possessed the self-knowledge which the moralists recommend, he must have known that he was neither a great nor a good man. In that case not a line of the autobiography would be composed. Fortunately for posterity, he was so overmastered by vanity he imagined that all the world then and afterwards must be grateful for records of rowdyism, beside which the crimes of galley slaves appeared trivial as school-boys' faults.

If it be asked why the autobiography should meet with a fate that is different from what awaits similar accounts of bad men's lives, an explanation is not difficult to find. CELLINI, as we have said, was not one of the great artists, but he was vain enough to believe he was their peer. Accordingly, he assumed that he was entitled to all the consideration which was awarded to his superiors. In his case the insisting on the dignity which belonged to DA VINCI or FRA COLONNA became absurd as MALVOLIO's, when his self-exultation made the household imagine he was turned heathen, a very renegade, "for there is no Christian that means to be saved by believing rightly, can ever believe such impossible passages of greatness." But the arrogance and presumption of CELLINI enable us to realise how much respect awaited artists in the sixteenth century. He was often so intolerable in courts, it was proposed as the only remedy to have him executed. That was partly in

jest, but it reveals how much it was necessary to endure for the sake of utilising such ability as he possessed.

His opinion of his own worth becomes evident from all his pages. Once in Florence there was a difference between him and the steward of COSMO DE' MEDICI about a house. Says CELLINI:—"I told him that such men as I were worthy of speaking to Popes, Emperors and mighty monarchs; that there was perhaps but one such as I in the world, whereas there were dozens such as he to be met with in every corner." In Rome, Mantua and Paris he made the rulers aware that he was no less assured about his supremacy in the arts, and they all meekly accepted his valuation of himself. It was only necessary for him to suggest that, as other parts of Europe were anxiously awaiting his coming, he could not complete the work he had undertaken for some Prince or Pope, and at once the highest were compelled to succumb. His dealings with the Popes were on the whole the most amazing of his impertinences. His passion was excited by any trifle. Like BENVOLIO, he was ready to quarrel with a man who in coughing waked a dog, and then he would slay or kill the offender without any hesitation. On one of those occasions Pope CLEMENT ordered that BENVENUTO should at once be arrested and hanged where the deed was committed. The artist kept quiet for a few days and completed a medal he had in hand. He then went to the Pope, who was in the Belvedere with several noblemen of the first rank, and presented the impressions like any guileless artist. The Pope's love of art overcame his sense of justice, for he asked an attendant, "Were the ancients ever as successful in striking medals?" CELLINI thereupon improved the occasion by delivering a homily to His Holiness on the necessity of restraining his temper. Referring to the order for his execution, he said, "I make no doubt your Holiness would have felt remorse for the loss to yourself; but neither parents nor masters possessed of prudence or good-nature will ever suddenly resort to severities against their children or servants, for they know that subsequent repentance will be of no avail for what was done in passion." It is easy to imagine the poor Pope's confusion at the scene, and it is no wonder that when another charge of assassination was brought against CELLINI, he should endeavour to get out of the difficulty by saying that men who are masters in their profession, like BENVENUTO, were not amenable to ordinary laws.

The fact was the Pope, equally with the rest of the Italians, was as much under the sway of art as if it possessed magic power. The first important commission which CELLINI received from CLEMENT VII. was a clasp for a cope. Two or three times a week the Pope required to see it while in progress. Before it was completed the jeweller found an opportunity to satiate his revenge on a musqueteer, who in self-defence had fired on CELLINI's brother. After the deed he found refuge in one of the Roman palaces and was advised to complete the clasp. When it was ready CELLINI carried it to the Pope, who, as he relates, "frowned on me very much, and with angry looks appeared to reprimand me; but on seeing my work his face became serene, and he praised me for doing so much work in a short time; then, looking at me significantly, he added, 'As you have recovered your health, take care of yourself.'" But the pontiff showed still more eagerness about a chalice which he intended to use in the grand religious processions. CELLINI prepared a design showing the cup supported by figures of Faith, Hope and Charity, and around the base were reliefs of The Nativity, The Resurrection and St. Peter's Martyrdom. The artist was anxious to produce a fine work, for he expected it would obtain for him the office from which SEBASTIAN the Venetian was soon to obtain the cognomen "Del Piombo." The Pope was afraid CELLINI would lose the spur to exertion and the chalice would not be completed. He therefore kept the appointment open. The artist became impudent and the post was given to SEBASTIAN. But the kindly CLEMENT promised to bestow the next lucrative appointment that was vacant on BENVENUTO, if he had carried out the commission. The jeweller became sulky and declared the Pope's promises were not to be trusted. Every day an officer was sent to inquire into the progress of the chalice, and was put off. When the Pope left Rome for Bologna, one of the duties entrusted to the Cardinal

* *Les Artistes Célèbres: Benvenuto Cellini.* Par Emile Molinier. Paris: Librairie de l'Art.

Legate was to look after CELLINI's work. The Cardinal was of the old despotic school and threatened to send BENVENUTO to the galleys, where he would be compelled to finish the chalice. That was enough for the artist, and he declared he had done with the job. When the Pope returned he lost no time in ordering CELLINI to appear. The disappointment of CLEMENT can be fancied, and he was to be excused when he threatened to have jeweller and chalice thrown out of the window. CELLINI justified himself by saying he suffered from ophthalmia, which was the consequence of being threatened with the galleys by the Legate. That prelate was appointed to Parma, probably for his indiscretion, from whence he sent another goldsmith (a coiner he had rescued from the flames), who was supposed to be a genius and more than competent to complete the chalice. The Pope accordingly ordered the work to be given up to him, but CELLINI refused to part with his property. He was next taken prisoner. The chalice was seized. Then it was returned to the artist and the Pope promised to grant any favour he would ask if he completed it. Many other complications followed, but CLEMENT was not to be made happy by once clasping his chalice.

A man who was able to defy the Pope in Rome need not be afraid to encounter other princes, and CELLINI was in no place afraid to indulge his wayward spirit without any limit, as if he were above all earthly powers. When FRANCIS I., after the exercise of much diplomacy, believed he was fortunate in alluring him to France, he gave him a commission for six gods and six goddesses, which were to be formed of silver and exactly of the king's height. After a time CELLINI lost interest in the figures. There were influential enemies opposed to him, but FRANCIS continued to be his friend. Circumstances however compelled the king to expostulate with CELLINI, and what he said enables us to understand the troubles which awaited all who attained the privilege of attaching Renaissance artists and scholars to their courts. According to the autobiography FRANCIS said, "Is it not remarkable, BENVENUTO, that men of genius of your class are not aware of your incapacity to display your powers without our help and the opportunities we create for that purpose? That recollection ought to diminish your pride and obstinacy. All I desired of you were twelve silver statues. You preferred to produce a salt-cellar, vases, heads and a thousand other fancies of your own, as if you were only to gratify yourself. I shall be compelled for the future to insist on obedience, and if you are obstinate in giving way to your whims you will be running your head against a wall." CELLINI adopted his usual course of surprising the king by a sight of works that were unexpected. He also employed language that was, as he says, a mixture of pride and haughtiness with humility, and of course asked for permission to return to Italy. FRANCIS was thunderstruck, and offered to smother CELLINI with gold if he would only carry out what he promised. But the artist knew his strength and went back to Italy.

It now seems remarkable that so much was borne from a man who was after all only a goldsmith. Some other members of the craft had become most able painters and sculptors. But CELLINI was not possessed of the strength that was required for high flights. The relief in bronze of the reclining *Diana* or *Nymph* which is now in the Louvre may, we suppose, be accepted as an average specimen of the works he executed for the French monarch. KUGLER considers it to be executed with delicacy and elegance; they are the qualities in which it appears to be deficient. To make a sort of nymph out of a woman who, with the exception of a wreath and a sort of bridal veil is nude, and to surround her with swine and other animals, while she reclines on a waterproof sheet by the side of a stream is no great effort of imagination. The figure is not refined in the contours. The most that can be said in favour of the work is that the lunette has no space to let. That a goldsmith whose experience was confined to works on a small scale should be competent to undertake so large a piece of metal-work was most creditable to him. We must remember also that in those days there were no technical institutes or treatises where the mysteries of casting life-size figures were expounded. CELLINI's instruction was derived from what took place in the workshops of ordinary goldsmiths, for he does not mention any instance when work of

a different class was entrusted to his masters or employers. He aspired to be more than a mechanic, for he made drawings after MICHEL ANGELO's *Battle of Pisa* when an apprentice in Florence, and in Rome he made use of the paintings in the Sistine and in the Farnesina. But when PORZIA CHIGI, on seeing his drawings after RAPHAEL, inquired whether he was a painter or a sculptor, CELLINI replied that he was a goldsmith and then was entrusted with some jewels to set. That he was sometimes considered to be only a mechanic is apparent from his treatment in Mantua. He was recommended by GIULIO ROMANO to the Duke, who at once gave CELLINI an order for a little shrine to hold a reliquary, but asked the painter to prepare the design. GIULIO replied that BENVENUTO was competent to dispense with another artist's design. The circumstance suggests that the goldsmith's fame was unknown except to a few patrons. The general opinion among artists may have been expressed by BACCIO BANDINELLO, when the sculptor suggested that CELLINI, like other goldsmiths, kept a "ghost" to do the designing.

As far as we have been able to make out, BENVENUTO CELLINI prior to his visit to France was not able to obtain a commission for a single work that could not be easily carried in the hand, and was not recognised as a sculptor in the ordinary acceptance of the word. The French Monarch, we suppose, imagined, like many of his contemporaries, that it was as easy to work on a large as on a small scale, and as CELLINI's sketch-models were likely to be more finished than those submitted by sculptors, it was concluded that the completed work would also be superior. The statuette of the *Perseus* which is in the Florentine Museum is suggestive of a nobler figure than is to be seen in the Loggia; the little model in wax is still finer, and there may have been as great a difference between the sketches and the sculpture produced for the French king. FRANCIS risked much, and it was fortunate he was not compelled to endure any disappointment from so hazardous an experiment, which would bring his judgment in question. That his taste was not very refined is evident when we learn how he considered CELLINI's *Jupiter* was vastly superior to the reproductions of the masterpieces of antique sculpture which were placed near it.

In Italy CELLINI was prized as an artist whose jewellery popes, princes and princesses were proud to wear. They were also willing to submit to his caprices for the sake of the ornaments he was able to produce, and which were always delicate, in spite of the sanguinary work that so often occupied the jeweller's hands. In France there was less discrimination, and in consequence CELLINI appeared as a sort of demigod to the king. The belief in his omnipotence is apparent not only from the orders for big statues, but from the singular commission by which BENVENUTO was entrusted with the fortification of Paris. It is true he was not allowed to execute the work, for court influence was too powerful against him, but the fact remains that FRANCIS was prepared to leave the defence of his capital to a man who, although the son of an architect, never assisted construction. His plausible talk on military subjects captivated FRANCIS I., and it was no less effectual with COSMO I. afterwards, for the Duke abandoned an approved scheme for fortifying one of the gates of Florence, and substituted CELLINI's, although it was incomprehensible to old soldiers.

The assurance which made CELLINI pose as a military engineer and undertake works beyond his abilities brought punishment with it. He left France in the hope that a few days' absence would compel FRANCIS I. to value him more highly. But the king was becoming wearied with an artist who involved him in "scenes" with Madame d'ETAMPES, and whose projects were too colossal for his treasury. FRANCIS was six years older than CELLINI, and as his strength was declining he must have felt that he was not likely to see the completion of figures which were to be of unprecedented dimensions. His "Foi de Gentilhomme" was, however, sufficient to insure profitable employment to the artist. CELLINI was not satisfied unless his liberty to create was uncontrolled. He asked for a holiday, and the king said to him, "BENVENUTO, you are a great fool," which was as accurate a judgment as could be expressed. They were the last words of FRANCIS, and CELLINI was free.

He anticipated, we suppose, that his prestige would

overcome his fellow-citizens in Florence. The Duke was willing to have CELLINI attached to his court, for he could be made useful, and COSMO was resolved that the outlay on account of him must be insignificant. To the officials of the court and to the citizens BENVENUTO was as unimportant as a prophet in his own country. He might believe he was the descendant of that FLORENTIUS who was CÆSAR'S companion in arms and gave his name to Florence. They remembered him as the apprentice of MARCONE, the goldsmith, as a youth who was turbulent and banished for misdeeds more than once. CELLINI wished the world to forget he was a jeweller. His ambition was to appear as the successor of DONATELLO and MICHEL ANGELO. The duchess and courtiers found pleasure in thwarting his schemes. COSMO was indifferent: all he cared for was to acquire the reputation of being a princely patron of art on economical terms, and as he paid BENVENUTO only about one-sixth the value of his works, and gave the money in instalments, he could hardly expect to find a cheaper artist. The relation which CELLINI gives of his later years in Florence becomes saddening. He imagined he was one of the shrewdest of Italians; yet he was cheated by the Duke, cheated by his banker, cheated by peasants, nay, by everybody, as if he were a simpleton. It was harder to bear, perhaps, that the man who defied the laws in so many capitals, whose threat was a death-sentence, was treated by the magistrates as if he were the humblest of the citizens. In his account-book we find the following record:—"On to-day, 26 October, 1556, I, BENVENUTO CELLINI, came out of prison, and I have entered into a truce with my enemy for a year. Each of us had to furnish bail of 300 crowns." It recalls old CAPULET'S remark, "But MONTAGU is bound as well as I, in penalty alike." And in both cases the words mark the close of an era when men could enforce their own laws. Is it any wonder that soon afterwards poor BENVENUTO admitted to himself that he was "a great fool," and took the preliminary steps to abandon the world and enter into Orders, a transformation which was not to be completed, for he returned to the secular state and married a wife? It was a prosaic ending for so strange a life. BENVENUTO CELLINI died of pleurisy on February 14, 1571, being then in his seventy-first year.

It is not an easy task to write about a man whose autobiography gives him a better claim to remembrance among mortals than the half-dozen works in metal by him which have survived. M. MOLINIER has shown fine tact in what he has done, and a reader will find it is easier to follow his memoir than the original autobiography. His reserve, shown in not accepting countless examples as CELLINI'S work, in spite of dealers and museum keepers, is also creditable. But for all who care to understand the relations between the artist and his contemporaries, BENVENUTO CELLINI must always remain the best of expositors.

REGULATIONS FOR THE PRESERVATION OF ANCIENT BUILDINGS IN ITALY.

Translated by JOHN HEBB.

1. THE entireness of a building extends *in limine* to that portion of it which remains, as well as to any traces which may indicate original portions which have been destroyed. It follows, therefore, that in the ordinary course it is not right to proceed to the rebuilding of destroyed portions, inasmuch as such rebuilding may interfere with the study of, or the imaginary completion of the building, and may prevent the recognition of the original portions.

2. The renewal or substitution of portions, even if of secondary importance, of an architectonic building should only be employed as an extreme measure in order to preserve what remains, and should therefore be restricted to those portions which no longer fulfil their specific purpose or can no longer be repaired.

3. The works of repair (*consolidamento*) and renewal considered necessary to assure the integrity of a building should be carried out so as to interfere as little as possible with the general effect of the building.

4. In this respect it should always be borne in mind that the artistic value of a building is frequently to be referred to the modifications occasioned naturally to the

materials, which testify to the past age of the building and accentuate the good and evil of the materials, as well as of the methods of construction, and constitute a proof and a guarantee of their duration and normal stability. The pictorial effect of a building should be taken into account as well as its relation to the atmosphere (*ambiente*) formed around it by time.

5. The restoration of a building may be undertaken under the following conditions:—The re-establishment of portions of a building in their original position, or the removal of additions without particular historical or artistic value, and which do not add to the stability or good preservation of the original portions.

6. Before commencing a work of restoration it is necessary to collect the written or figured particulars relating to the building, having regard to the assistance which may be afforded by a study of works of a similar character and age to that which it is proposed to restore; to study the materials and constructive and decorative methods employed in the building, and to reconstitute, by means of historical records and inquiries, the injuries inflicted on the building.

7. The graphic portion of the preliminary study founded on the results of the foregoing researches should consist of making careful drawings of the structure and condition of the various portions of the building; of taking the necessary tests and plumbings; preserving a record of all the indications of constructive or decorative work, referring to photographs or engravings of such parts as are proposed to be altered; and preparing geometrical drawings of the works considered necessary and the results to be arrived at, reserving power to make any alterations which may be found requisite in the course of carrying out the works.

8. When, for reasons of stability or the attainment of a special æsthetic result, it is desired to have recourse to the completion of any part of a building, care should be taken that when the work is finished the essence, reason and scope of the renovation should be apparent. With this object, while employing materials similar to or allied to the original materials, a simplified workmanship should be adopted in harmony with the general effect, so that there may be no uncertainty as to the extent of the work of renovation.

9. It is permissible to demolish or remove any addition to a building in order to open out any important part of the structure or original decoration, provided the general effect of the building is enhanced thereby, and that such demolition does not result in the further exposure of the mutilations and disfigurement to which the building has been subjected. Before commencing any work of a similar nature it should be ascertained as accurately as possible what are the essential characteristics, and the state of preservation of the original portions of the building, in order to avoid uncertainty, surprises, difficulties and unforeseen expenditure during the progress of the works. When the portions removed have any artistic or historical importance they should be preserved in a place apart, or the fragments of the greatest interest collected, and drawn or photographed as a whole.

10. In every restoration which extends to the subterranean part of a building of a monumental character there will occur:—1. The opportunity of tracing the remains of any edifices anterior to the building to be restored, or the remains of other original arrangements of the same building. 2. The necessity of taking account of the most minute peculiarities of the fragmentary material obtained by means of excavation, especially with regard to its position or accidental deposit, from which it is often possible to deduce an indication of the original plan of the building.

11. This special attention to the material obtained by excavation should extend to material resulting from pulling down, among which may be found portions which may be made use of in the work of restoration, or may be usefully preserved on account of the indications presented with regard to the original arrangement of the building. These decayed artistic or scientific materials, together with any fragments which may be found in the vicinity of the building, which can be identified as undoubtedly belonging to it, should be carefully collected in view of the possibility of their being re-used, or from their interest in connection with the building.

12. Whenever it is found necessary to remove the

colouring or limewhiting which conceals any monumental portions of a building, it is before all things necessary to ascertain if there are any traces of decoration underneath which are interesting from an historical or artistic point of view, and if such be found, to proceed with caution, so as not to injure the structure of the edifice nor the original surface, avoiding the use of metal tools, and using solvent or corrosive agents only when it has been ascertained that the ancient material, having regard at the same time to the damaged condition in which it may be found, will not suffer injury. Any work for the completion of wall-decoration with paintings considered of historical or artistic importance shall be carried out by a special expert under the particular instructions of the Minister.

13. When it is proposed to strengthen a building by iron ties care should be taken that the architectural lines and the picturesque effect of the building are not injured, and in no case should the original building be altered with a view to concealing, in whole or in part, such subsidiary portions of the building. Care should be taken to obviate, by the exercise of timely caution, the injury which may be occasioned by the oxidisation and consequent swelling of iron ties, and in all cases where the original building is of costly material or delicate workmanship the use of copper should be preferred for the purpose.

14. The patching of decorative or ornamental features made with the single object of concealing marks of natural decay in the material employed in a building should be avoided, inasmuch as such operation involves the destruction of some original portions, and the chisel-work necessary to prepare the cavity for the patch may in many instances jeopardise or decrease the harmony (*consistenza*) of the adjacent parts. It is also to be remarked how rarely the operation of patching (*tassellatura*) sensibly improves the æsthetic effect. Alterations occasioned by atmospheric influence or accidental damage when not affecting the stability of a building should be respected. Where the damage is so extensive as to threaten the stability of other portions of a building, partial rebuilding should be adopted with the precautions recommended in the preceding articles.

15. When it is found necessary to repair the roof-covering of a building every trace of the original mode of covering should be preserved and displayed, and the original system followed as far as possible. Where the original form of roof-covering cannot be restored, a system should be adopted differing as little as possible from the original, and in no case altering the effect of the whole in the least degree.

16. Special care should be taken with respect to the regular and safe removal of water by means of arrangements which are consistent with the original condition of any building, preserving always any traces of previous arrangements for that purpose, even when they may have become unserviceable, or are not adapted for reuse.

17. When a building which has been injured by frost or rain is to be repaired, and it is found necessary to use a special roof-covering, whether temporary or permanent, care should be taken, in carrying out the work, that the general effect of the building may not be sacrificed thereby.

18. All works relating to stained-glass of an historical or artistic interest should be executed under the personal direction of an expert acting under rules laid down by the Minister.

19. Works for the restoration of pavements of particular importance, whether as regards the value of the material or the fineness of the workmanship, should be undertaken with no other object than the better preservation of the material and its original arrangement. Recourse should be had to the renovation of original portions only when cavities are disclosed which may become dangerous, or which may promote or accelerate the destruction of adjacent parts. The portions relaid should be constructed of materials differing from the original, in order that the extent of the ancient pavement may be made evident.

20. Decorations of an historical or artistic interest, such as inscriptions, ledger stones, &c., should not be removed unless with the object of preserving them from possible injury.

21. Shoring should be executed of materials sufficiently strong for the time necessary for the execution of the works of restoration. It is recommended from considerations of

economy that brickwork or other permanent materials should be used whenever it is probable that the work will last so long a time as not to justify the use of timber.

22. Provision should be made to free buildings from any vegetation which may constitute a direct cause of deterioration; this operation should, however, only be resorted to when its efficacy compensates for the risk of injury which may be occasioned to the building by its frequent repetition.

23. Care should be taken to prevent the improper use of placards which conceal the important portions of a building, or which injure the artistic or picturesque appearance of the same, and similar placards already in existence should be removed when opportunity offers.

THE SOCIETY OF ARCHITECTS.

THE annual general meeting of the Society will be held at St. James's Hall on Tuesday, October 30, at 8 P.M., when the election of officers and Council for the year 1894-95 will take place.

The following report of the Council on the membership examination question will also be submitted to the meeting:—

"The subject of the desirability or otherwise of an examination of candidates for membership was referred to the Council at the annual general meeting held in October 1893, and since then it has been under careful consideration. A committee was appointed and drew up a series of questions, which were approved by the Council and submitted to the members of the Society. The replies received have been considered, and the opinion of the members appearing to be practically unanimous, the Council have decided as follows:—

"1. That after October 31, 1896, election to membership will only be open to candidates who have passed the Society's examination, with the following exceptions:—(a) Candidates who are not less than thirty-five years of age, and have been directly engaged professionally in architectural pursuits, as principals, for at least seven years. (b) Candidates who are not less than thirty-five years of age, and have been directly engaged professionally in architectural pursuits as assistants for at least ten years.

"Candidates applying for membership under *a* and *b* will be required, as heretofore, to submit drawings and other proofs of their professional abilities.

"2. That the scheme of examination shall be formulated and published before June 30, 1895.

"3. That a register of students between the ages of seventeen and twenty-three years be open on November 1, 1894.

"Registered students shall be pupils or assistants in architects' offices and be nominated by a member of the Society, subject to the approval of the Council.

"4. Registered students shall be entitled to the following privileges:—

"Free admission to lectures to be delivered under the direction of the Council in London and the provinces; a ticket giving admission to the Society's ordinary meetings and the use of the Society's library for reference, and a copy of each issue of the 'Journal.'

"5. That each registered student shall be required to pay 5s. per annum, on November 1 in each year, and shall cease to be a registered student on October 31 next after his attaining the age of twenty-three years."

Mr. Edgar Farman (member) gives notice that he will move the following amendments:—

To Clause 1.—"That the following article be added as Article 11A to the articles of association, to become operative on October 31, 1896:—'Subject to confirmation by general meeting, the Council shall select from time to time certain examinations, which shall be deemed qualifying examinations for membership of the Society; and election to membership shall be only open to candidates, approved by the Council, who have passed any one of such examinations, with the following exceptions:—

"(a) Candidates who are not less than thirty-five years of age, and have been directly engaged professionally in architectural pursuits, as principals, for at least seven years. (b) Candidates who are not less than thirty-five years of age, and have been directly engaged professionally in architectural pursuits, as assistants, or as assistants and principals, for at least ten years.'

To Clause 2.—"That the first list of qualifying examinations selected by the Council be submitted to a general meeting, to be called not later than March 31, 1895."

To Clauses 3, 4 and 5.—"That the consideration of these clauses be postponed."

SHEFFIELD SOCIETY OF ARCHITECTS.

THE annual conversazione of the Sheffield Society of Architects and Surveyors was held on the 12th inst. There were between 300 and 400 guests. Mr. Gibbs, the president, said it was very gratifying to them that the invitations had been so generally accepted. Referring to the exhibition of sketches and measured drawings of ancient buildings in the district, executed during the summer months by the younger associates and students of the Society, Mr. Gibbs explained that the work of the Society was largely educational. They carried on their work in the form of lectures and discussions on special subjects, the formation of a library for the benefit of all the members, and classes on the study of the history and styles of architecture, sketching, designing, and surveying and levelling for the benefit of the younger members. The exhibits of the sketching class shown that evening was only a small part of the educational work of the Society. He hoped the work of the other classes would be as fully exhibited next year. The Society was also active in matters relating to professional practice, and desired, whilst protecting the interests of the profession, to command the respect of the general public by maintaining the honour of its members and the standard of their ability to solve successfully the complex problems of modern building and surveying, by combining the most perfect arrangements of plan, the best construction, and the most artistic conception and finish with the soundest advice as to values and cost and the practical superintendence of the work. The President then drew the attention of members to the programme for the ensuing session and of the students to the particulars of classes and prizes. At the request of the Council of the Royal Institute he called special attention to the new examination in architecture and to the new form of application for architects and chief assistants. He then proceeded to the distribution of the prizes to the members of the sketching class. The first prize was awarded to Mr. Frank W. Chapman for sketches and measured drawings of parts of the churches of Ecclesfield, Whitwell, Beauchief Abbey, South Anston and Laughton-en-le-Morthen, and other places in the neighbourhood; and the second prize to Mr. J. C. Amory Teather for drawings of the same buildings.

Afterwards the guests inspected the collection of pictures of the Sheffield Society of Artists, which were on view.

TESSERÆ.

Invention in Art.

WHEN used in the language of art, invention has a different signification from what it usually bears in common language. It does not mean discovery, but combines conception, or the peculiar way in which an artist's mind takes cognisance of a subject to be represented, with the mode of treatment, or choice of objects and manner of disposing them best adapted for producing a desired effect. Thus, in painting and sculpture, it is the faculty by which the most perfect mode of illustration, by colour or by form, is suggested to the artist, and by which the mind of the spectator is led to comprehend the truth, the intention and the whole purpose of the work before him; but so distinct is it at the same time from perfect execution, that it is often found to exist independently of excellence in that particular, some of the finest inventions in art being manifestly defective in technical requirements. It is therefore the highest quality in the constitution of the artist's mind; as Opie says, "Destitute of invention, a poet is but a plagiarist, and a painter a copier of others." It is hardly necessary to enter into the question whether the power of invention be a primary and original law of the mind, or whether the effect of cultivation. Some have believed it may be a result of acquirements begun in youth and carried on till the power is developed and perfected; others conceive that it is unattainable by any human effort, and is part of the original constitution of the mind. But even admitting invention to be a gift of nature and not reducible to rule, nor to be taught by any regular process, it still may be improved by study. Whatever natural disposition or original capacity may exist—and it will not, we suppose, be denied that some minds are more bountifully endowed than others—every power short of creation must have groundwork and foundation on which and out of which to exercise itself; and even the inventive faculty, which seems to approach nearest to creation, depends upon knowledge, by whatever means acquired, for materials with which to develop and declare itself. Sir Joshua Reynolds says, "He who has the most materials has the greatest means of invention, and if he has not the power of using them it must be from a feebleness of intellect;" and "it is in vain to endeavour to invent without materials on which the mind may work," &c.

Decorative Art.

All the greatest art in the world is fitted for a place and subordinated to a purpose. There is no existing highest-order art but is decorative. The best sculpture yet produced has been the decoration of a temple front; the best painting the decoration of a room. Raphael's best doing is merely the wall-colouring of a suite of apartments in the Vatican, and his cartoons were made for tapestries. Correggio's best doing is the decoration of two small church cupolas at Parma; Michel Angelo's, of a ceiling in the Pope's private chapel; Tintoret's, of a ceiling and side wall belonging to a charitable society at Venice; while Titian and Veronese threw out their noblest thoughts not even on the inside, but on the outside, of the common brick-and-plaster walls of Venice.

Apelles, the Painter.

The character of Apelles shows itself in a noble light in his conduct towards Protogenes, who was not duly appreciated by the Rhodians. Apelles, finding many of his pictures on his hands, offered to purchase them of him at his own price, but Protogenes named so low a sum that Apelles fixed fifty talents for the purchase of the whole, and allowed it to be reported at Rhodes that he intended to sell them as his own. This conduct opened the eyes of the Rhodians to the merits of their painter, and they secured the pictures for themselves at the price fixed by Apelles—upwards of 10,000*l.* Apelles was famed for his industry; he never spent a day without exercising his pencil in some way or other ("Nulla dies sine linea"). The old proverb also of "Let the cobbler keep to his last" originated, it is said, with him. It was a custom with the Greek painters to expose their pictures when finished to the public view in the front or in the porches of their houses; and a cobbler found fault with the sandal of one of the figures of Apelles thus exposed, but perceiving it corrected on the following day was bold enough to venture his criticism upon the leg also, when Apelles came out and indignantly told him that the cobbler should keep to his last, which from that time became a proverb ("Ne sutor supra crepidam"). The majority of the works of Apelles seem to have been portraits, or of a portrait character, his subjects seldom containing more than one or two figures. Two pictures only by him are mentioned by ancient writers as compositions of many figures—Diana surrounded by her Nymphs, in which he was allowed to have surpassed the lines of Homer, from which he took the subject; and the pomp or procession of the high priest of Diana at Ephesus. His horses, which he appears to have often introduced into his portraits, were very celebrated. Ancient writers tell various anecdotes attesting their excellence. Many anecdotes also are related attesting his familiarity with Alexander the Great. He used to glaze or tone his pictures with a dark transparent varnish, after they were finished. Lucian reckons him among the four greatest colourists. He survived Alexander many years, but neither the date nor the circumstances of his death are known. He left writings on the arts.

Rubens as a Painter.

The source of pleasure from works of art is obscure, and the nature of the pleasure itself is little capable of definition, but men think to obtain greater precision, and to arrive at the reason why they are pleased, by this process of comparison. To a certain extent perhaps we may succeed, but in general such comparisons have a tendency to narrow our field of enjoyment, and to lead us to dogmatise on what cannot be reduced to fixed rules. A man may derive greater satisfaction from the works of Perugino or Francesco Francia than from those of Rubens or Teniers; he may feel the beauty of the Parthenon more than that of Strasburg Cathedral, but he is not therefore justified in saying that Rubens was a bad painter, or that Erwin of Steinbach was an indifferent architect. The principal sources of pleasure in painting appear to be form, composition, colour and, the highest of all, the expression of human character and action. The subdivisions of this last branch are of course infinite, and comprise the higher and holier feelings, as well as those which are more properly a portion of our animal nature. In those parts of his art which act immediately on the senses Rubens was without doubt a great master. He understood the perfect management of light and shade, of composition and of colour. If his merits are disputed, it is with reference to the subjects which he painted and to his mode of treating them, not to his technical skill. Before his visit to Italy he had acquired an individual character as an artist. The fruit of his labours there was not a crude mass of detached imitations, but whilst he carefully studied the great masters at Venice and elsewhere, his vigorous genius assimilated and appropriated to itself all that it took up or borrowed. The excess of individual peculiarity in Rubens certainly amounts to manner in the narrower sense of the word. That peculiarity of feeling, too, did not dwell on the

forms which are best fitted for expressing the tranquil and devotional sentiments which prevail in early Christian art, but still, such as it was, it was eminently characteristic of a great painter. Sculpture exceeds painting in its power of expressing form, and equals it in that of portraying fixed character; but painting only can express the tumult and energy of human action in full power and motion. In this Rubens excelled, and it is surely no mean excellence. We are ready to grant that his *Madonnas* are for the most part clumsy and undignified; that their forms are unfitted for the being whom they represent, and that exaggeration sometimes disfigures scenes where quiet and holy feelings would be more in place. Notwithstanding all this, the stronger human passions and actions have an intense interest for mankind. The animal energy and the sensual characteristics of man are a part of that complex whole which we call human nature, although they are not the most elevated part. If art is to represent man as he is, these elements cannot be wholly overlooked. The Greek drama displayed them too glaringly in the olden comedy, and Greek sculpture embodied them in its fauns and satyrs. An acute sense of beauty indeed generally softened the more disgusting features, and we might wish that Rubens had been oftener touched with similar scruples. We must take him, however, as he is, with all his technical excellence, and with all the incomparable energy and heartiness which animates his best works. In them there is none of that idle filling up of vacant corners, or that insertion of cold academic figures, wholly unconcerned with the scenes portrayed, which we find in works of the same kind by other masters. If we look at Rubens's *Village Fête* in the Louvre, the ring of peasants wheel round in the dance with a drunken merriment which seems in actual motion before us. The smaller picture of *The Last Judgment* at Munich is just as wonderful for this quality of movement as for its glorious colour and execution. His *Battle of the Amazons* in the same collection conveys, in a most wonderful degree, the struggle and energy of a combat. Action and life he never failed to represent as no other painter has done before or since, and this alone entitles him to a place in the very foremost rank of artists.

Bubb Doddington's House.

Bubb Doddington's house, which stood in the parish of Tarent Gunvill, Dorset, was commenced by George Doddington, of Somersetshire, about 1718, but he only finished the offices; the house itself was completed by his nephew, the notorious Bubb Doddington, the son of an apothecary at Weymouth, who raised himself by Court intrigues into a considerable position, and was created Lord Melcombe. The house was completed by him at a cost of 140,000*l*. The main body of the house extended 144 feet, and was 95 feet in depth. Plates of the house and garden are given in Campbell's "*Vitruvius Britannicus*," vol. iii. It is alluded to in Thomson's "*Seasons*," Autumn, i. 651, 669, and other poems. Lord Melcombe died without issue in 1762, bequeathing his property to his cousin, Mr. Wyndham. It then came by family settlement to Richard Grenville, Earl Temple, and descended to his nephew George, second Earl Temple, created in 1784 Marquis of Buckingham, who sold it to Josiah Wedgwood, the famous potter, whose widow resided there. It then passed into other hands, and was ultimately pulled down, the materials selling for about the plumber and glazier's bill of the original dwelling.

John Constable, R.A.

Constable seemed to think that he came into the world to convince mankind that nature is beautiful. Instead of seeking for the materials of poetic landscape in foreign countries amidst temples and classic groves, or in our own amongst castles, lakes and mountains, he taught that the simple cottage, the village green, the church, the meadow covered with cattle, the canal with its barges, its locks and weedy banks, contained all the materials and called up all the associations necessary for painting. He doted upon his native fields. "I love," said he, "every stile and stump and lane in the village: as long as I am able to hold a brush I shall never cease to paint them." So great a lover of simple truth could not tolerate the commonplaces of art or literature. The freshness and novelty of his pictures, he continues, both surprised and delighted the French painters at the time they were exhibited at the Louvre. They seemed more like the works of nature than art. The dew of the morning was found upon the leaves and the grass. Originality in every art will always meet with opposition from those whose ideas are bounded by the commonplaces of the day. It was Constable's glory that he did not escape. The damnable judgment of the critics confirmed him in his own views and gave fresh animation to his exertions. "A great connoisseur," he says, in one of his letters, "called on me the other day and told me he did not like my picture. This convinces me there must be something good in it." But while disgusted with the cant of ordinary criticism, he delighted to hear honest John Bannister, the comedian, say he felt the wind blowing in his face as he looked at his pictures, and Fuseli

declare that they made him call for his umbrella. "I care not," he would say with Sterne, "for the dogmas of the schools; let me get at the feelings and the heart in any way I can." The above extract clearly points out the style of Constable, the peculiarities of his execution and of his character, though the process of reasoning is not very evident which leads him to conclude that there must be something good in a picture because a connoisseur dislikes it, or to lead him to feel delight because looking at his pictures makes one man feel the wind and another fancy it is going to rain.

The Ely Octagon.

One of the most exquisite specimens of Decorated architecture in England is the Octagon of Ely Cathedral, as it is familiarly called. In the early part of the fourteenth century the old centre tower, over the junction of the nave with the choir and transept, fell, and the present octagonal tower was built in its place. This tower owes its beauty mainly to the interior. The exterior is not very striking, because it is too low in respect to its width, and the lantern of wood with which it is surmounted does not well correspond in character with the stone octagon on which it is placed. The octagon is not equilateral, but consists of four broad faces with four narrower faces intervening, the broader ones facing the four cardinal points. The octagon is only of one storey above the roof, and has an arcade of Pointed arches, some of which are pierced through and glazed as windows. Below these arcades are rows of acutely Pointed windows. The interior of this octagon, however, is its striking feature. In the four greater sides of the octagon are four lofty arches, which open respectively into the nave, choir and north and south transepts. The four smaller sides have four smaller arches, opening obliquely into the side aisles, and having small windows above them which are seen externally. These arches are supported by eight gracefully-clustered columns or piers, the capitals of which are composed of beautiful wreaths of foliage. The surface of the wall between the arches and the windows above is occupied by canopied recesses and brackets. The clustered columns, from which the ribs of the vaulting of the octagon spring, rise from the top of a number of richly-canopied niches, supposed once to have contained statues: these niches rest upon brackets, each of which is supported by a small cluster of very slender columns. On the capitals of these small columns are represented in relief the most important events in the history of St. Etheldreda (the Anglo-Saxon foundress of the abbey of Ely), each one of the eight capitals representing a particular event. In the centre of the vaulting of the octagon is an aperture, 30 feet wide, upon which the lantern is set. This octagonal structure has been described as a most singularly-beautiful and skilful work, in which solidity and gracefulness, magnificence and lightness are so happily blended together, that the spectator is at a loss to decide in which of these respects it is most worthy of admiration. The idea was altogether new, and the work remains to this day an undeniable proof of his exquisite skill and taste as an architect. By throwing the weight upon eight strong piers and arches, instead of four, he has given to this part of the cathedral not only greater strength, but a magnificence of space and a gracefulness of form such as is seen in no other cathedral in England of the Pointed style. An immense body of light is let down from the lantern above.

Cennini's Treatise on Painting.

The "*Trattato della Pittura*," by Cennino Cennini, a pupil of Angelo Gaddi, may be termed the oldest modern book on painting. It was first published in Rome in 1821 by the Cav. Giuseppe Tambroni, with a preface, notes and an index. The work is divided into 171 chapters and occupies 157 octavo pages. There are three MSS. of it extant—that in the house of the Beltrami di Colle, which may be the original MS. noticed by Vasari; another in the Laurentiana at Florence, Banco 78, No. 24; and a third in the Vatican Library, MSS. Ottoboniana, No. 2964, dated 1737, and formerly in the possession of Baron Stosch; it is, however, badly transcribed. The first and second mentioned may be the same MS. The original MS. was finished July 31, 1437, in the prison for debtors, and when Cennini was about eighty years of age. Cennini was born about the middle of the fourteenth century, for he was apprenticed to Angelo Gaddi in 1375 at the latest, as he was with Gaddi twelve years, and Gaddi died in 1387. Supposing Cennino to have been born, therefore, about 1360, his book may be considered as belonging to the fourteenth century, and to give us the practice of that period. Cennino treats in this work of the rudiments of design; colouring; materials and their use; on the preparation of colours, their nature and origin, and on tools; on fresco-painting; on distemper on walls and on perspective; on oil-painting, with oil thickened in the sun; on gilding; on distemper (*guazzo*) for panels and canvases, and on the method of preparing grounds; on gilding, varnishing and illuminating parchments, and on taking casts from the life, &c. There is an English translation by Mrs. Merrifield.

NOTES AND COMMENTS.

OVERSEERS and assessment committees have a hard task whenever they are compelled to place a value on charitable institutions. If they apply the common scale they are considered to be more merciless than SHYLOCK, while, if they make allowances, they are held to be unjust to the rate-payers of their district. The most equitable way, on the whole, is to ask what rent would a tenant have to pay for the premises under ordinary circumstances? Mr. VIGERS, in his evidence before the betterment committee, said he determined the rateable value of St. Thomas's Hospital by considering, in the first place, what the land was worth as a hospital site, and, secondly, what would be the value of a plain building, "not a building built in the expensive way it is built," in such a position. The outlay was very large on the hospital, but Mr. VIGERS considered about 6*l.* a foot was an adequate rate. On Tuesday last, at the Quarter Sessions at Lewes, the question had to be determined in respect of the Surrey Convalescent Home at Seaford. The building was erected three years ago at a cost of 10,000*l.* by a benevolent person. In January 1892 the gross value was put down at 590*l.*, which was 5 per cent. on the outlay and 90*l.* for the land, the net value being 470*l.* The Trustees appealed to the rating authorities, and the value was diminished to 360*l.* gross and 290*l.* net. This year a demand was made for poor rate on the assumption that the home was worth 420*l.* gross and 350*l.* net. The Trustees appealed. It was admitted that the buildings were costly, for although there were only fifty beds, the outlay was more than in another home where 180 patients were accommodated. Mr. DENMAN, architect, one of the witnesses for the assessment committee, said that he should have no difficulty in finding a tenant for the home as a school at 500*l.* a year, but as a matter of concession he would advise that the method of assessment should be based on an estimate of 4 per cent. on the building and 3 per cent. on the land. As the land is valued at 2,800*l.*, that scale would bring out the gross valuation at 484*l.* The magistrates, after careful consideration, found the gross value of the home was 400*l.* and the net value 320*l.* From the conclusion it would appear that 2½ per cent. on total value of land and buildings gives a sufficient net value for taxation.

THE approach of the winter as usual has hastened the production of technical books for the use of students. A small but excellent volume on "Specifications," by Mr. JOHN LEANING (SAMPSON LOW, MARSTON & Co.), is, however, adapted for others also, as it can be often utilised by the young practitioner. It is arranged in an orderly manner corresponding with the most convenient arrangement of a specification. More contrast in the type would have made reference easier for all who are in a hurry and are anxious about including everything in a specification. Mr. C. F. MITCHELL, of the Polytechnic Technical School, has increased the quantity of books prepared for the coaching of students who are about to undergo the ordeal of examination of the Science and Art Department and other bodies by his "Building Construction" (B. T. BATSFORD). Books of the kind do not allow of much variety of treatment and the competition becomes one between prices; it must be allowed that in this case a substantial volume is given for 5*s.* 6*d.* "Thermo-Dynamics," by Mr. J. PARKER, M.A. (SAMPSON LOW & Co.) is hardly a book that is adapted for those who are mainly occupied with statical problems—although the boundaries between the two great divisions of mechanics become less definite as time runs on—but the author is a thinker, and his pages have importance for students of those laws of life of which NEWTON may have had a glimpse when he compared himself to a child walking on the shore with an ocean beyond him. Since agricultural labourers, like so many philanthropists, have arrived at the belief that *repoussé* is the beginning and end of modern technical education, and a remedy for general distress, it is surprising there are not more books on the subject than on building. In Mr. J. HARRISON'S "Decoration of Metals" (CHAPMAN & HALL) we have a workman addressing workmen, and he imparts really useful information for those who propose to live by means of metal-working, as well as for all who take up

this fascinating art as an accomplishment. It is a pity there are not many more modest but serviceable books, which can be placed on the same shelf. There are some illustrations in the pages from works by VECHTE and MOREL LADEUIL, artists to whom Birmingham is indebted, and also some from ancient examples. But in the majority we see the baneful influence of South Kensington, and with such "decoration" as is represented it is no wonder "Brummagem" goods are only appreciated in districts where there are departmental art schools. How a man who writes so sensibly is not ashamed of the ornamental things he employs as patterns is one of the educational mysteries which are not to be explained. "American Plumbing," by Mr. A. REVILL (International News Company), hardly bears out the title, for a large part relates to English appliances, while others which are much used in the States are not noticed. In a country where "plumbing regulations" are enforced in so many cities there ought to be more of the national inventiveness applied to the trade than is suggested in the volume.

IN the North of Ireland runs a range known as the Slieve Beagh Mountains, forming a boundary between Monaghan and Tyrone. There is a very ancient tradition about the name. In the "Annals of the Four Masters" it is recorded as follows:—"Forty days before the Deluge CEASAIR came to Ireland with fifty girls and three men, BITH, LADHRA and FINTAIN their names. BITH died at Sliabh Beatha, and was interred in the cairn, and from him the mountain is named." There is a tumulus which is known as "Carn-More," and it is locally considered to be the grave of the ancient immigrant. It is formed of loose stones and stands on a rock which is utilised as a quarry. In the course of the excavations the tumulus has been undermined and a large part of the circle has fallen down, revealing the heathy and peat moss covering of the mountain. After surviving for a period which no chronologist would now venture to estimate, it is unfortunate that the prehistoric monument should be doomed to ruin. One of the members of the Irish Society of Antiquaries, in reporting the circumstance, writes:—"Whether the broken section of this cairn can be replaced or repaired I know not; but one thing seems clear, that it is the bounden duty of the Society to check as speedily as possible this act of vandalism, and thus to arrest the destruction of a monument which dates from the earliest colonisation of our country, and which far and wide forms a familiar landmark." As the quarry is not worth more than three or four pounds a year there ought to be little difficulty in preserving the most ancient of all the Irish monuments.

THE restoration, or rather the completion, of Cologne Cathedral was for many years a subject of interest not only in Germany but wherever Mediæval architecture was admired. Strangers used to wonder that funds were not immediately provided and the works carried out with expedition. It may not be known that the conservation of the cathedral was costly and that for ten years the King of PRUSSIA subscribed about 2,000*l.* a year in order to keep the choir alone in repair. Between 1824 and 1881 when the restoration was completed, the outlay on the building, according to Herr BEIMANN, was 19,624,000 marks, or nearly a million sterling, a sum which appears larger in Germany than in England. While the French were omnipotent the building was fast becoming a ruin. In 1816, when the Empire had collapsed and there was a hope of peace, the project of completing the building found favour. SCHINKEL, the architect, had received a commission from the King of PRUSSIA to design a cathedral that would be a memorial of the satisfaction of the dawning of a new era in Europe, but public opinion was in favour of making the ancient building in Cologne serve that purpose, and SCHINKEL himself was probably of the same opinion. AHLERT and afterwards ZWIRNER were charged with the restoration. In 1842 the people were dissatisfied with the slow progress, and a society was accordingly formed with the object of obtaining funds to have the works carried out energetically. In the next year the foundation-stone of the extension was laid by FREDERICK WILLIAM IV. The works then undertaken occupied exactly forty years to complete.

The Architect, Oct. 19th 1894.

A SHOP FRONT, PRINCE'S STREET, EDINBURGH.

DESIGN FOR THE NORTHERN POLYTECHNIC INSTITUTE.

THIS was one of the six designs submitted in the recent limited competition for this Polytechnic, to be erected in Holloway Road, N. An attempt has been made to contrive a workable plan by a simple arrangement of corridors for men and women respectively, with top and side lights, and a cross corridor at the back leading to the workshops and having a separate approach from Brand Street.

The large entertainment hall is centrally placed near the public entrance, and provides accommodation for 1,250 persons. The social club-rooms are also placed near the entrances, the reading-room, library and museum being on the first floor, approached by stone staircases from the main vestibule.

The social or club side of the Polytechnic has thus been kept to the front and the educational to the back of the building. The workshops and class-rooms are contained on first floor, with science lecture-rooms and a complete suite of music-rooms. An art school is provided on second floor, with range of north lights.

Considerable difficulty was felt in providing the extensive accommodation set forth in the requirements issued to competitors for the sum of 25,000*l.*, but the frontage to Holloway Road only being 130 feet, and the rest of the building practically hidden from public view, the cost per cube foot was calculated at a low rate.

The front to Holloway Road was intended to be of red brick and Monk's Park Bath stone, and the total estimated cost including heating, 27,600*l.* Mr. T. PHILLIPS FIGGIS was the architect.

NEW POLICE BARRACK, CHAPELIZOD, CO. DUBLIN.

THE drawing of the new Police Barrack, Chapelizod, Co. Dublin, which we publish was designed and etched by Mr. HOWARD PENTLAND, B.A., Bac. Eng., A.R.H.A., F.R.I.B.A., senior surveyor to the Board of Public Works, Ireland, and was hung at this year's exhibition of the Royal Hibernian Academy of Arts. The site adjoins the Phoenix Park, between portion of which and a bend of the river Liffey lies the little village of Chapelizod. It is intended to have communication with the Phoenix Park as well as with the road through Chapelizod, both for the proper supervision of the park and to enable the constables who are off duty to avail themselves of the pleasures of its 1,700 acres. The contract, exclusive of the sewage disposal, the boundaries and approaches and the formation of the parade ground, has been let to Mr. JOHN PEMBERTON for 3,150*l.* The ground-floor walls and the chimneys will be finished with first quality red bricks from Portmarnock, near Dublin, where Mr. PLUNKET has succeeded in turning out a good supply of fine vermilion bricks. The upper portion of the walls will be plastered and the roof covered with red Ruabon tiles. It is proposed to deal with the sewage in three Dortmund tanks, with the patent "Oxygen" process of Messrs. ADENEY & PARRY. We understand that Mr. MELLISS, M.Inst.C.E., the well-known authority on sewage disposal, visited the works for this process erected some time ago from Mr. PENTLAND'S designs at the Central Criminal Lunatic Asylum, Dundrum, and that he has written a most favourable report on them.

THE PORTLAND ARMS TAVERN, 60 HIGH STREET, ST. JOHN'S WOOD.

THIS building, which is the first property rebuilt under the new leases, has been erected in High Street, St. John's Wood. It is a landmark and an example of the elaborate construction adopted at the present date for licensed property. The upper fronts are of Portland stone with red brick facings. The lower fronts and internal fittings are of polished walnut and oak, largely relieved with brilliant cut and bevelled plate-glass. The work has been carried out by Mr. J. E. WALL, builder, 192 Hackney Road, from the designs and under the supervision of the architect, Mr. R. A. LEWCOCK, 88 Bishopsgate Street Within, E.C.

THE ARCHITECTURAL ASSOCIATION.

THE conversazione of the Association was held on Friday evening at the Queen's Hall, Langham Place, W., when a large attendance of members and friends assembled. Mr. E. W. Mountford, who now enters on his second year as president of the Association, welcomed the visitors as they arrived. The vice-presidents, Messrs. Hooper and Pite, the hon. secretaries, Mr. F. Goldsmith and Mr. B. Fletcher, the hon. treasurer, Mr. H. W. Pratt, and many other prominent members of the Association were present. The musical programme for the evening was successfully carried out by the Rebec Orchestral Society and the Pierrot Banjo Team, Mr. W. Horsey acting as hon. conductor of the former, and Mr. Clifford Essex for the latter. Mr. Leonard Butler presided at the organ and Miss Ethel Bonavia at the pianoforte. The prize drawings of the students were displayed, as well as a collection of photographs by the Camera Club and photographs by the late J. L. Robinson, as taken by him during the last annual excursion to Wells.

Among the exhibits were specimens of church furniture and ecclesiastical robes, art metal-work, including brasswork, altar crosses, chalices, &c. Messrs. Watson & Co. showed photographs of rich copes, as designed by Mr. G. F. Bodley for All Saints Church, Margaret Street, W., and Lichfield Cathedral. Messrs. Jeffrey & Co., Essex Road, showed samples of their handsome wall-papers, but, contrary to their usual custom, the designers' names were not apparent. Messrs. S. J. Waring & Sons, of London and Liverpool, showed fine samples of textile materials, also parquet flooring, mantelpieces, &c.; the Graislaid Block Printing Company, pleasing designs executed in silks, velvets and chintzes, also carpets; Messrs. Turberville, Smith & Son, carpets; Haywood & Co., wall-papers, some as designed by Mr. John Belcher, Mr. Beresford Pite and Mr. C. Heaton; Messrs. Collinson & Lock, cabinets, silk hangings, &c. Among the exhibits, as a rule, there have usually been a goodly show of water-colour drawings by members, and it would have been a disappointment not to have seen some works by Mr. Phené Spiers. With the exception of Mr. Phené Spiers, the other members were conspicuous by their absence as regards showing any water-colour drawings.

LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

THE first meeting of the new session of the Lancashire and Cheshire Antiquarian Society was held at Cheltenham College, Manchester, on the 12th inst. Professor Boyd Dawkins presided. The President congratulated the members on the position of the Society. It was firmly established among the archaeological societies of the country, and was doing local work of the very highest importance not only with regard to the period covered by history, but also the period beyond history in the remote past. Much of the success the Society had achieved was without doubt due to the indefatigable secretary, Mr. Yates. He had not been able to prepare a set address, and he was obliged to fall back upon one or two points of archaeological interest which had come before him during the last three or four months. He had been working at the apparently unpromising subject of human skulls. A number of skulls had been discovered in the excavation of the Preston docks, underneath the alluvium and in association with the old forest which existed at that place. These skulls he found upon examination to belong to a people of very fair intellectual development. All of them were ovate skulls, tending in one or two instances towards the long-headed type. Of their place in European ethnology there could be no doubt. They were absolutely identical with skulls found all the way through these islands and into France and Spain. Along with the skulls were found others of a different and newer type—round skulls with high cheek bones. These belonged to a people who made their appearance in this country in the Bronze Age, and along with the skulls were found bronze implements. Both types—the Iberic and the Celtic—were represented in the present population of the country. He had been remeasuring the collection of skulls made in Derbyshire by the two Batemans during the first half of the century, and had been astonished to find the enormous preponderance of the Celtic type. The Celtic people were certainly the dominant inhabitants of Derbyshire in the Bronze Age. The same remark applied to Yorkshire, and these round skulls were also found scattered about in large numbers in the South of England. Some interesting discoveries had recently been made near the town of Glastonbury, in Somersetshire, by a committee of which he was a member. In the digging up of the old village some curious facts had come to light with regard to the people of pre-Roman times.

Mr. Yates read a paper prepared by the Rev. J. R. Luck, S.J., on the opening of the large tumulus near Stonyhurst; the Rev. E. F. Letts read a paper by Monsignor Gradwell on the church at Overton, which he maintained was the oldest church in Lancashire, tracing it back to the sixth or seventh century.

DISCOVERIES IN ARCHITECTURE.*

By Professor T. ROGER SMITH.

CAN there be such things as discoveries in architecture here, and now at the end of the nineteenth century? I fancy that I hear some persons under whose notice the announcement of the subject of this lecture may have come put this question, with a quiet idea that it ought to be answered in the negative. It is my intention, however, to show, in addition to some notice of past discoveries, that there are and will be discoveries in architecture at the present day; and, what is more, that some of these discoveries should await yourselves if you are to succeed as students. Let us first, in order to clear the way, make sure as to what a discovery really is, and what it is not. Discoveries and inventions have been so mixed up in people's minds and are so often intimately associated in actual fact, that perhaps the first thing to point out is that a discovery is not an invention. You discover something that exists; you invent something which has not existed before. Discovery is the proper reward of research; you dig in order to uncover what is hidden. Research is the digging process; discovery happens when you dig successfully. Experiment is the usual method by which invention is forwarded. You think of the best means of compassing a result and then you make a trial. In architecture the way of making that trial is by making a drawing, and one of our main difficulties is that from the best drawing to a finished building is such a long step. Very many inventions, especially scientific ones, have not only been based upon discoveries, but have followed close upon them or have gone, so to speak, hand in hand with them, so that the distinction between discovery and invention has in such cases become obscured; but it is a very real one. Let us illustrate it by an example or two. One of the greatest discoveries of modern times was the discovery of America. One of the greatest inventions was that of printing. At any rate, these two great feats serve to illustrate extremely well the leading distinction between invention and discovery. America was there (and had been there for ages) when Columbus first reached its shores. He in no sense created or invented America, but he did discover that country. On the other hand, printing did not exist before the days of Gutenberg, if he was the inventor of printing. Writing existed, it is true, and the first printing was an imitation of writing; but the power of reproducing a number of copies of the same document by using movable types had never been obtained before. Printing did not exist—it was invented, and thenceforward it remained one of the arts of civilisation for all time. The word "discovery" signifies an uncovering of something covered up—a bringing to light something that is hid. It is (let me add) a personal thing, and though it is often enough followed by the making public of the discovery, that is (please to note) quite a separate matter and may be postponed or omitted. Columbus discovered America on the day the hazy outlines of a distant coast began to rise over the dim margin of the ocean, not on the day when he returned to Europe the proud bearer of the tidings that there was a new world to conquer. The discoverer of the richest gold mine in Queensland kept the knowledge to himself for years till he could buy the land in which it is situated. Once more (and this is an important consideration) a discovery is so much a personal thing that it is not essential to its being a discovery that the object discovered should be unknown to everyone else. When Speke and Grant discovered the vast lake in the heart of Africa they found a geographical feature previously unknown to themselves and to Europeans generally, but familiar enough to the hundreds and thousands of African natives who lived on its banks. Nay, even if a man literally uncovers a buried relic, such as a Roman pavement found in the heart of London under 10 feet of accumulated soil, what he uncovers to-day is indeed to him a discovery; but it was familiar enough to the Roman artists and artisans who designed and made it, and to the Roman soldier or colonist whose house it adorned, and whose friends and family were constantly walking over it. Discoveries of things absolutely and always unknown are always rare, and in some branches of study, architecture among others, are in the nature of things impossible. But in the sense of finding out or uncovering something previously unknown to the discoverer discovery occurs frequently, and it is by far the most healthy, the most interesting and the most successful form of study. I propose, then, in this lecture to begin with the simple, but most valuable, discoveries which you as students must make for yourselves if you are really to master the art of architecture, and then to proceed to notice some of the discoveries which have taken place in recent years which are more brilliant in their character and relate to architectural matters that have long lain hid. I propose to distinguish these, and call them respectively personal and public discoveries, for there is this distinction certainly between them, that the discoveries which a student makes are mostly

of importance to him personally, but are not such as need be made public. Those which an explorer may make are perhaps quite as important to the general public as to the discoverer, and are usually published to the world.

Personal Discoveries.

The information you obtain in the offices where you work, or from attending classes like those about to begin in this college, is hardly discovery; it is instruction, and the worst of it is that, as it is not difficult to get, it is very apt not to stick in the memory. The information discovered by making researches on your own account is mostly obtained with difficulty and trouble, but it is seldom, if ever, forgotten. You may make discoveries in a library. For example, let us say that you are advised to read a handbook, say "Fergusson's History," and you do so, finding it perhaps a rather laborious task, as the reading of any condensed book always must be. You notice, however, that the numerous woodcuts all have references to the names of writers from whose publications they are copied, and having access to books, say to the Institute library, or that at South Kensington, or some other collection of books, you begin to consult some of the original authorities, and among them you discover some book of which the illustrations or the letterpress, or both, bear on what you have been reading about, and are full and clear and interesting. The book you have discovered only occupies a corner of the vast field that Fergusson travels over; but then the writer really has the leisure to take possession of that corner, and to throw a clear light upon it. The mere fact that you have to some extent unearthed the book for yourself helps to give a zest to the reading of it, or the examination of its illustrations. It is a discovery. Nor is it in a public library only that such discoveries can be made. In any collection of books or photographs or prints to which you have access, and on the shelves of second-hand booksellers and the tables of bookstalls, you can have the same good fortune. I, for example, myself possess not a few valuable books on subjects connected with architecture which first came to my knowledge through finding them on bookstalls. This reference to discovering books ought not to be made without alluding to the help to be got from one very valuable book of reference, which just now possesses a melancholy interest for some of us. I allude to the "Dictionary of Architecture," of the Architectural Publication Society, a work bristling with sign-posts—if I may use such a phrase—calculated to direct the student (in his search for knowledge) to the best sources of information. In almost all the articles the most copious lists of references occur, and it is of the greatest use to a real student to have sources of information so liberally spread before his view. This work (begun by a circle of architects, some of whom only have survived to see its completion) would have been left unfinished but for the indomitable energy and public spirit of Mr. Cates and the learning and patience of the late Mr. Wyatt Papworth, and it is impossible just now to mention the "Dictionary" without alluding briefly to the great loss which architecture has within the last few weeks sustained in the recent death of the last-named architect (Mr. Papworth). He was full of accurate and well-digested information on every subject connected with our profession. He was an indefatigable, systematic and accurate worker, singularly quiet and simple in his manner and bearing and was universally esteemed. In many ways his vast store of technical information has been made useful to the members of his profession. To you, gentlemen, his work, as editor of Gwilt's "Dictionary," the value of which he practically doubled by the additions he made to it, is pretty sure to be familiar; but there are many others and many important memorials of him in the literature of our profession, and his death leaves a blank which it will not be easy to fill up. To return, however, to students' discoveries—of which, by-the-by, the late Mr. Papworth made many and valuable ones—architecture can be better learned from buildings than from books, and it is in visits to buildings, ancient and modern, that you will make the discoveries that will be of most use to you. The most simple building, if it is good, has some secrets if you can but make them out. Why is it pleasing? Why are there certain irregularities? How is it constructed? What has been its history as a structure? These and such-like questions should present themselves to the mind, and if we can but discover the answer to one such question, the visit to the building in respect of which it is asked will have been fruitful. Among the most interesting features of ancient buildings are the traces of their history which they bear indicating the successive enlargements, alterations, rebuildings and so forth which they have undergone, and the discoveries of this sort which a keen student, examining an old manor-house or a church, a cathedral or a castle, may make for himself are extremely interesting and extremely instructive. One of the most complete accounts of such a series of discoveries illustrating the past history of a great building by its actual visible marks exists in the account of Canterbury Cathedral, from the pen of the late Professor Willis. No man during the present time of careful research has been more keen or more

* Inaugural lecture delivered at University College on Thursday evening, October 11, 1894.

successful in his examination of ancient buildings than he, and this record is a good example of the manner in which it is possible to make them tell the story of their varied changes, alterations, rebuildings and extensions. Even without a tenth part of the minuteness and elaboration of Willis's investigation, if you simply establish the broad divisions of Saxon, Norman, Early English and so forth in a building with a chequered history, and recognise the most obvious features of each period, you will have discovered the leading facts in the history of the building. In this sort of research it is peculiarly true that "to him that hath shall be given." To a person even of artistic taste and power of observation, entirely devoid of architectural knowledge, a building is almost a sealed book; but when you have got even a little knowledge from other sources a building begins to be legible. As an example, I would suggest to any student who has read something of the changes in tracery, in vaulting, and in mouldings which occur in English architecture, that when he has obtained some knowledge of these things from books he should go to Westminster Abbey cloister, getting first from Scott's book the dates at which it was done, and identify the different features of each period, and the changes both in feature and in general proportions. He will find that he has discovered a good deal of what is really meant by the terms Early English, Decorated and Perpendicular. It is possible to make discoveries on drawings of buildings as well as on the buildings themselves. As an example of what I mean: if you take the drawings of one of Sir Christopher Wren's churches and examine them carefully you may perhaps discover some of the principles upon which he designed them. He was a very orderly and mathematical worker. He had strongly impressed upon his mind the conviction that the establishment of geometrical relations between the main dimensions of his building was a means of securing that their proportions should be pleasing, and if, with this clue in your mind and a pair of dividers in your hand, you examine a series of engravings giving the plans, sections and elevations of his churches—of St. Paul's Cathedral—you will, I think, find it possible, and extremely instructive, to discover some of his methods of working. The plan and sections of St. Stephen's Church, Walbrook, generally recognised as the best among Wren's many successful interiors, will be very good to begin with. A famous place to investigate is a good museum. I doubt whether any one of you has seen, let alone studied in, all the museums of London which furnish information about architecture, though I hope most of you have studied, or will study in some. The first, of course, is the British Museum, where a very considerable amount of examples and specimens of ancient and Classic architecture exist. Setting aside the library, which is enormous, there is a great deal of Egyptian, Assyrian, Lycean, Greek and Roman work to be seen there, chiefly in the shape of fragments of ornament and features, such as a capital from the Parthenon, and parts of a sculptured column from the Temple of Diana at Ephesus. The South Kensington Museum and the connected Indian section include a great deal of Gothic Renaissance and Oriental architecture and a magnificent collection of casts, practically as good as the originals for our purpose. Another, and perhaps a finer, certainly a better classified collection of architectural casts exists at the Crystal Palace, and a third of Mediæval work at the Architectural Museum. Sir John Soane's Museum, a collection made by an architect to illustrate his art, must not be forgotten, and in every one of these a visitor, going with some knowledge to start upon and a spirit of research, cannot fail to make discoveries that will be both profitable and pleasant. We have spoken about discoveries in a library, in a building, in a set of plans. There are also discoveries in a city. Here in London architects of more or less skill have been designing and building for a thousand years. Much of their work (good or bad) has disappeared, for the relentless tooth of time has been eating it away almost as fast as it has been done—but not quite, and so in this Metropolis a vast mass of architecture, of course chiefly modern, is accumulated. The Great Fire destroyed most of the earlier work, but not all of it, and even putting that aside as most of it too well known to leave much room for discovery, there remains work of the seventeenth, eighteenth and nineteenth centuries, not a little of it hidden away, to reward the diligent investigator. This is especially true of interiors. In the parts of London which were fashionable a century ago, and where large houses were erected which are now used for different purposes—such, for example, as Lincoln's Inn Fields—you may often discover most interesting fragments of architectural work. There are a few of the companies' halls which contain good work, but little known, and in one shape and another there is a good deal to discover in domestic and secular buildings, of which the authorship may often not be known, but which is appropriate and beautiful. A long series of architects, since the days when the work of the individual architect came to be known by his name, have wrought in London, and though their prominent works may be well known, even these (some of them) may be now in obscurity, and of the best known it is, generally speaking, only the outside

that nine observers out of ten have troubled themselves about. London has specimens of the work of Inigo Jones, Wren, Hawksmoor, Gibbs, Chambers, Soane, the Brothers Adam, Wilkins, Cockerell, Barry, Pugin, Smirke, Scott, Street, Burges, Sedding, F. P. Cockerell, and many others. Here, too, are specimens of the work of able architects now living, whose designs are influencing the course of public taste at the present day, and are, perhaps, almost as much worth your study as the work of any past age. How many of these do you know about? How many remain to be discovered? And even of those you know, how many interiors have you seen? To go a step further, every cathedral town in England, every great city, every country town, and pretty nearly every village contains an example, or a group of examples, of architecture in which there is much that you can only know by discovering it for yourself; and even if England has been very thoroughly examined, and a great deal of all the architectural work has been more or less described and illustrated, there is a vast amount that is practically unknown. This is especially the case with English mansions and manor-houses, many of which, if illustrated at all, are in many cases only known from picturesque perspective views, and are not illustrated in such a way as to give an idea of their wealth of architectural treatment. The visitor to Penshurst, Knole, Hever, Bramshill, Purham, Audley End, Westwood, Hatfield, or Woollaton or Burghley, will find plenty of architectural discoveries to make, even though each of these mansions may have been more or less illustrated. That an architect should overhaul the church in any village or town where he may be, if it be of good design or possessed of features of interest, is, I hope, so much a matter of course that I do not stop to point out how much can be discovered and appropriated in journeys and country rambles; but I am disposed to dwell upon the modern work which awaits the traveller in various parts of England. The country is now thickly sprinkled with fine mansions and smaller country houses, nearly all of them good and many of them extraordinarily good. The towns are now distinguished by their town halls, their banks and other public municipal buildings, and often by the possession of a hospital or the neighbourhood of an asylum of the greatest possible interest in many cases to the student of sanitary science. Individual towns also have the impress of the work of architects of genius who have practised chiefly in and round them. You must go to Glasgow and study the work of Thomson if you want to know how Greek architecture can be turned to account in supplying the architectural treatment of modern Scottish warehouses and churches. You will in Manchester learn what a genius Walters was; for there also, and in Liverpool and in the great cities of the North of England, you will find modern work of the greatest possible value done by good architects still living and working among us. Discoveries are more obviously awaiting the traveller who may cross the Channel. It is quite true that France, Italy and Germany have been visited again and again by keen observers, and the results published; but even so, you must see the building and judge for yourself before you can grasp what is meant. Even in the most familiar building—St. Peter's at Rome, or Notre Dame at Paris, or St. Mark's at Venice—there is a world of unpublished facts to discover, and much more is this the case the moment we step off the beaten track. France especially is full of good architecture that is very little known in England, and there would be no great difficulty there in practically discovering a first-class church, perhaps even a cathedral. Spain is full of architecture very little published; the East full of what is yet practically unknown.

With regard to modern work, the discoveries that await an observant architect travelling on the Continent and taking the opportunity of visiting the great cities are startlingly numerous and strange. I have no doubt that a visitor to the United States would find them not less numerous, and certainly not less startling; but I have not been so fortunate as to see America, and I will not attempt to describe the new architecture of that great country, though I am convinced that there is a better chance of the development of a modern style of architecture in the United States than in any part of Europe. Remaining nearer home, however, the architect who will visit the great German cities, such as, for example, Frankfurt and Cologne, Brussels and Vienna, will discover that the Renaissance style on European soil is really capable of new and striking developments which we have rarely attempted. Miles of new boulevards and streets are to be seen in these and in other continental cities, full of elaborate, vigorously-designed and costly buildings, all of them (so far as they can be classed as belonging to any style) of Renaissance character, but every one of them differing from the types we have studied and are reproducing. Here, if anywhere, there are discoveries to be made in modern architecture. I do not say that the buildings are all good, but many of them are. I do not say that the details are pleasing—they are often too coarse for that; but there is a freshness, a suggestiveness, and a sense of vigour about these boulevards which make up for a good deal of the deficiency in refinement. In thus

considering what at the outset I called personal discoveries—namely, those which a student must make for himself—I have gone through that part of the subject which probably is of the greatest value to you, gentlemen, as students. But you may have expected that I should also tell you, and show you, something of public discoveries in architecture, and we will now, if you please, turn to that division of the subject. The present age has been one in which extraordinary revelations of the past have been obtained by keen investigation to an extent that could never have been anticipated. Of course, inscriptions, sculptures, ornaments, pottery, weapons and objects of this sort—but especially inscriptions—have furnished this most remarkable and definite information; but no inconsiderable amount of architecture has also been discovered. Buried remains usually display arrangements of plan rather than entire buildings; but in not a few cases they are dug up complete, while abandoned buildings have been found entire in places now solitary, and ancient structures have been discovered standing in inhabited, but seldom visited localities. Fragments, pavements, ornaments, architectural features and details, and even representations of buildings have been found in abundance. Discovery in architecture may be considered to have begun, so far as we are concerned with it, at the Renaissance in the sixteenth century. That great change in men's ideas—the starting-point of modern life and art—began in Italy, and the artists of the Renaissance soon became familiar with the remains of Roman art in their own country, and studied them with eagerness. Several of the Italian architects and antiquaries of the seventeenth century have left treatises and illustrations of Roman buildings, and their own architecture was based on that of their Roman predecessors. In the eighteenth century Italian architectural books became numerous, and many of them describe monuments; and some of the Roman remains outside Italy, as for example Palmyra, appear to have attracted notice at the same time. In the eighteenth century, moreover, the study of ancient Roman art was much stimulated by a discovery, in the most literal sense of the word, of the utmost interest and importance. I allude to the digging-up of the buried city of Herculaneum, and later on the better-preserved Pompeii. Herculaneum was known as early as 1711, but excavations at Pompeii only began somewhere about 1750. The course of exploration and discovery thus started went on, and has, with brilliant results, been continued from time to time. Nothing has shown us so much of the details of ancient architecture as the Pompeian explorations. At Pompeii, as you know, an extensive buried town has been laid bare, house by house and street by street. Exploration and the publication of discoveries are still going on there, and though the main public buildings were found and dug out long ago, most interesting houses are still discovered from time to time. It was about the middle of the last century that attention in England was seriously drawn to the remains of Greek architecture by the publication in 1762 of the "Antiquities of Athens" by Stuart and Revett. Though Athens was a well-known city, this careful examination of the most important architecture to be found there amounted to a discovery, and the effect on public taste of the publication of the work was considerable, followed as it was very shortly by the "Antiquities of Ionia." Greece and Asia Minor were by degrees most fully explored and described; but Greece has proved inexhaustible, and is at the present day a field of the most interesting modern research.

The next great series of architectural discoveries relates to the architecture of Egypt. Napoleon took possession of that country in 1799, and sent with his army an expedition of men of learning and artists, and the temples and such of the tombs as had up to that time been discovered were visited and explored, and a magnificent book full of engravings and descriptions was published. Since that day this work of exploration in Egypt has been carried further, and the magnificently-illustrated work of Lepsius, in twelve folio volumes, has published to the world the results of a great German exploring expedition there in the years 1843-45. In Egypt also exploration and discovery have still gone on, but of course the greater part of the recent results belong to the domain of archaeology rather than architecture, though the profession of Egyptology in this college has been successful in recovering much that is interesting as to Egyptian buildings. Some other fields of architectural research should not be overlooked. For example, in Asia Minor, Caria and Syria were explored successfully by Sir Charles Fellows, and Central Syria has been visited with successful results by M. de Vogué, whose discoveries are of the deepest interest in the deserted cities of Roman origin of Central Syria. His book gives representations of buildings of a sort of Roman architecture, still entire, of great grace, skilfully designed and excellently built, and standing unoccupied and uncared for in the Syrian deserts. I ought not, perhaps, to omit the many discoveries of Roman architectural remains which have taken place in this country. Usually not much more than the stumps of the walls, showing the plan of the building, the hypocausts, and in many cases the

richly-ornamented tessellated floors are recovered from such places as Silchester and the various Roman villas, but even so much has great interest and value; and in a few cases, especially in the fine Roman thermæ at Bath, excavation has brought much more to light and has revealed most of the architectural features of work of a highly-finished character, very well preserved and striking. It is by the spade that the most remarkable discoveries of modern times have been won, and none of them is more valuable than the recovery of Nineveh and other Assyrian cities by Layard, Botta and Place. Much which is not architecture has been won for us in Assyria. We have been enabled to read the letters, the books, the very accounts and ledgers and cash-books, and we have received a flood of light upon the history of all the nations of antiquity so dazzling that perhaps the architectural part of these discoveries has become forgotten. But we have recovered the plan and the lower parts of the walls of several palaces of the utmost magnificence and complexity, and we have representations of others on the alabaster sculptured slabs which extended not only for feet, or hundreds of feet only, but for miles, along the face of those palace walls. Of ancient Persia, the ruins were not buried in sand and earth to the same extent as in Assyria, and they have suffered much ruin; but here again the spade has, within no very distant period, brought to light objects of surpassing interest. A French antiquary and his wife, M. and Mme. Dieulafoi, have discovered and brought home splendid specimens of wall decorations, as embossed, glazed and coloured brickwork, now displayed in the Louvre, Paris. The gradual spread of knowledge about countries outside our own shores has brought to light architecture, not so startlingly new as was revealed by the digging up of Pompeii or the opening of the tombs of the Pharaohs at Thebes, but still of moment. These discoveries occurred to some extent in the seventeenth century; and to a great extent in the eighteenth, so that in the best-known countries, such as Greece and Italy, the explorers of the nineteenth century have chiefly been occupied by making our knowledge more complete. Such work, for example, was done by Professors Cockerell and Donaldson, and by Mr. Penrose, in Greece and Asia Minor. Such also was the discovery of the ruined remains of the mausoleum at Halicarnassus, by Sir Charles Newton, and the recovery of the long-lost Temple of Diana at Ephesus, by the late Mr. Wood. The startling results obtained by Dr. Schliemann at Mycenæ and Tiryns include the recovery of two Greek fortress-palaces, at any rate of the plans, and that of the fortifications which protected them, and of decorative details of great interest. Research at Athens, at Olympia, at various other ancient sites in Greece, and in Cyprus, Asia Minor and elsewhere, has gone on, and is being prosecuted with most interesting results (and of one discovery of Greek work I propose to show you some examples directly), and it has also been prosecuted with singular vigour and success in Rome. Very much is now known about the ancient buildings of Rome which was only matter of conjecture twenty years ago, and there is, no doubt, more to follow. Before, however, we wander too far from them, we must for a moment turn to the discoveries that have been made in Christian and in Oriental architecture. We had detected, before all this was carried so far as I have taken it, an English architecture of the greatest variety and beauty, and had learned that there corresponded with it a French, an Italian and a German Gothic style with countless examples. The important Mediæval buildings of almost all Christendom, except perhaps Spain and Portugal, have been, it is said, discovered and thoroughly examined, measured, photographed and described, and are as well known for the most part as ordinary methods of publication can make them, and yet there is not a single one of them which is not the depository of artistic secrets not enriched by subtleties or ornaments, which are not for the first-comer, all of them waiting the earnest student to discover them. Nor are the possibilities of finding more startling novelties than we expect exhausted. Very recently a large series of photographs representing Christian churches, chiefly Mediæval, in towns and cities in Apulia, on the shores of the Adriatic, have made their way to London, and we find that at Bari and the neighbouring places an Early Italian Gothic flourished, bearing a far closer resemblance to the Gothic of Western Europe than is found in the Gothic buildings of the better-known Italian cities of the west. These photographs are an example of the fact that, well as Italian art has been studied, it remains an inexhaustible mine. There remains still one phase of Christian art where much in all probability still awaits the inquirer. I allude to the art of the Greek Church. Byzantine buildings exist even in Constantinople that are barely known, and much more are they to be sought for in more remote places. Some of them have been lately studied by Mr. Schultz and Mr. Barnsley, and these will be in time made known to the world in the book of those gentlemen; but more remain. Constantinople, however, reminds us that there are countries not less extensive and populous than European ones with an art of their own, an architecture of their own and countless examples in the shape

of mosques and temples, palaces and tombs. The entire East, though not unknown, is all but unstudied. I quite admit that there is a something in Oriental art which, beautiful as it is, seems to repel European sympathy, if it awakens almost unbounded admiration. But when I mention Egypt, Syria, Persia and Japan, and above all India and Burmah, I name a whole hemisphere crowded with buildings of interest and importance, of which not one in a hundred is generally known. If any one wants a field where discoveries can certainly and readily be made, let him try India.

THE STYLE HUNTERS.*

THE practice of blindly accepting all that is contained in some particular historic style of architecture and attempting to make it the American style is one for which I have never had any friendship.

While I admire the spirit of research that places all the forms and details of any style at one's pencil point, and while it would be still more admirable if the research was extended to all styles, I condemn the judgment which permits indiscriminating copyism. Furthermore, I wish to express disapproval of the fashion of assuming that the ability to copy is the highest evidence of professional scholarship. I do not accept the ability to copy well as an evidence of artistic feeling, and I will not be governed by the notion that copying is the only "correct" and "proper" thing. The attempt to judge everything that is done by the requirements of some prevailing style is a species of intolerable pedantry with which I have no patience. It is only an application of "faddism" for which the consistent thinker should keep on hand a large dose of preventive. We should not be scared by the philippic of the narrow-minded, one-idea critic, nor by the adverse judgment of the advocates of a one-styled school curriculum, nor by the jeers of the followers of the swing from style to style, who remind us of a bumble bee buzzing from one jimson flower to another, all the while keeping up a noise to attract attention, and constantly saying, "I am on the most beautiful flower in the whole barnyard."

Every style in history has its good qualities and its weaknesses. Neither of them nor all of them are suitable for us. We must proclaim a declaration of artistic independence—perhaps wage a seven years war to free our own minds from the thralldom of the mother and grandmother styles of the past. What I contend for is thought, independent and free; I insist that not all the available things in historical work are contained in any one style or in any of the three grand divisions of the architecture of preceding ages. We must have a higher, broader and more scholarly criticism.

For many years "style hunting" has been a fashionable amusement among architects of this country. The effort now being made to force an acceptance of the Renaissance of Italy and France as the architectural style of this country recalls to mind the fact that similar efforts have been made heretofore in favour of other styles, each effort seeming to be temporarily successful but all ending in final failure, as the present effort will probably do before many summers come and go. The promoters of these different movements have all been enthusiasts in pursuit of the "favourite phantom," and each has attempted to "ride rough shod" over the fallen fancies of preceding generations of hobbyists. Each class, for the moment, has claimed to possess the "true artistic" feeling and to be the only one possessed of "good taste." Each class has written profound arguments showing why that particular phase of architectural expression was the particular one that should be adopted; but each of these generations of enthusiasts, after riding the wave of temporary applause has gone with "McGinty" to the bottom of the sea. To everybody else these races of "style hunters" seem to lead a perilous life. About the time their efforts are ready to be crowned with success some other knight in the artistic tournament mounts his charger and claims to be the true leader, and after a few artistic sword passes the older hobby, ridden to fatigue, gives up the race to the fresh steed, and the rider is tumbled off into the common herd. When we come to think of it, what "a time" these fierce generations of "artistic rainbow chasers" do have. To a man not afflicted with these beautiful hallucinations it is a play in high comedy to see the present earnest efforts upon the part of some of the alleged great designers of the country to fit all of the absurdity and weakness of Renaissance detail—as well as what is really meritorious—into present day wants, and to hear with what loud blowing of trumpet they are announced as the "learned" architects of the times, and to hear the hooting and tooting of in horns by which they are proclaimed "leaders" by the "small fry" critic and copyist. The serious character in this play is the average architect, who in this country, as elsewhere,

is compelled to earn his daily bread by the sharpening of his pencil, and in the hurry to be doing many things, and doing them quickly, in order to make both ends meet, he has no time for investigation. He takes up what he finds in use, makes the best he can out of it, uses the style while it seems to be in favour, and passes on to the next as the fashion is set by those who to him are the real leaders. It is a matter of no particular consequence to him whether his designs are Renaissance or Romanesque as long as he gets his money for them and they seem to please his clients. It is no cause for loss of sleep with him if he designs two houses for adjoining lots, one in French Gothic and the other Colonial. For a man to be thus tossed hither and thither on the wave of public fancy, being compelled to vary his preference from one side to the other as the wind blows one way or the other is discouraging to say the least. It is liable to lead him to stop short sometimes and inquire "where he is at," as I do now, for within our own recollection we have had the Gothic fashion, the Mansard fashion, the Eastlake fashion, the Queen Anne fashion and Romanesque fashion, and now the Renaissance fashion, and what fashion we shall have next even the Man in the Moon would be unable to say.

The series of attempts to engraft a foreign style upon this country is a succession of chapters of copyism. These generations of copyists have had little respect for each other's work, usually not enough when the completion of a building has been involved to carry out the design of their predecessors. They have all been iconoclasts in each other's camp, and each newcomer has sent the lares of the former tenant to the rubbish-heap, only to have its family gods desecrated in the same manner by its successor.

These movements that come and go like the tides of the sea, however, result in the tendency to establish firmly in the minds of both architect and public the facts, first, that none of the old styles can be adopted in this country; second, that they all contain admirable qualities and all contain incongruities and absurdities; third, that all need a regeneration or a complete transformation in order to be legitimate artistic progeny of our civilisation.

Architecture is an art of precedents. All races of builders throughout all history have gone to the storehouse of existing work to gain a supply of information, and have felt free to make such use of what they could find as would be instrumental in expressing their own ideas. Many of them have gone through a succession of experiments, such as we have, in first trying to use some other style before producing one of their own; but as such experiments have always resulted in failure, these labours of the "style hunters" have been removed, have disappeared and been forgotten as the taste of the time became more highly cultivated. Naturally the incongruities resulting from wholesale cribbing from foreign art became unbearable, and these buildings were the first to give way to new structures or to be boldly stripped of their more objectionable features. No one presumes that any one of the great styles of architecture of history was born. They all grew through centuries of time, as ours must do. We cannot buy, borrow or make architecture to order, and we must not appropriate a style by copying its details. We may study its principles and receive suggestions from its forms, but it is the underlying idea of each form and detail that is to be made the subject of inquiry. We may learn how they clothed their ideas with line and form and colour, and thus learn the principles which underlie all architectural expression. We must rise above all styles and orders so as not to be fettered by them, or to have our views of the countless productions of art obscured, just as the producers of all historic styles have done in their times. To copy details in architecture is like committing the demonstration of a theorem in geometry to memory. It enables us to say over again what the book says in the same way the book said it, but it gives us no clear idea of the problem we have attempted to demonstrate. Those who devote themselves to a style fall into the practice of using any detail anywhere about a building, although it may have originally been intended for some particular place. And they are in the habit of using the same detail whether working in iron, stone, wood or clay, no difference for what material the detail was originally designed. Instead of all this our ornament should have an appropriateness to the material in which it is produced, and the place it occupies, and the building for which it is designed. It should have a meaning to us in our day, and it should be the best we can make of the existing opportunity and the means at hand. The use of steel and electric light is a thing of this day, and they must not be turned down as not being architectural. They must be used as other materials have been used in the past so as to reach the highest possibilities of their employment, but we must not try to use steel with forms suitable for stone, and we must not use our electric light and insist upon placing it where we would a candle.

The question then arises, How are we to use what we find in the architecture of the past? The answer to this question is much too long to be given in a paper like this, if, in fact, it can be given in anything like completeness. A few points

* A paper read by Mr. J. W. Yost at the Annual Convention of the Ohio Chapter of Architects.

only must suffice for the present purpose. First, it is ideas, not forms or details, that we must seek—the underlying idea and not the manner of expression is the prime object of inquiry. Second, the observation and study of existing work furnishes a field of suggestions to the mind as to what ideas can be and ought to be expressed in architectural design. Third, we should learn the science of design, through the aid of which we may be taught how to express our own ideas, so that the designer will be able to express joy or sorrow, grandeur, beauty, stateliness, devotion or frivolity at will. When we have thus learned what to express and how to express it we will be free to produce designs in architecture as the musician, with a knowledge of the scales, is to write the great musical productions of the world.

HASTINGS CASTLE.

THE committee of the Sussex Archaeological Society and several of the subscribers to the Hastings Castle Excavation Fund on the 10th inst. inspected the dungeons, when a paper was read by Mr. Charles Dawson descriptive of the excavations. He said it was not to be supposed that the present gateway of the castle, from outside which access is obtained to the dungeons, was the original gateway. A wall ran across the bottom of the present pathway to the castle, the main entrance to which was probably through the barbican towers on the east side. A light wooden bridge was probably thrown across the moat on to the outer ward now known as the Ladies' Parlour. The two entrances to the dungeons were evidently situated within the bastion of a large tower, of which now a portion only remains. The entrance to the dungeons was in half an octagon. On two sides were doorways leading downwards in north-eastern and south-eastern directions. A steep flight of ten stairs descended on the north-east side. They are now worn with deep grooves. The arched masonry terminates above the lower end of the stairs, where there are traces of a movable door having been fixed. The passages forward are all hewn out of the sandstone rock. Throughout the whole of the series of galleries the roofs and arches are invariably rounded, and their solidity and almost entire absence of ornament gives a decidedly early Norman aspect. From the foot of the stairs a short passage suddenly turns to the south-east, terminating in an arch slightly grooved at the sides. Through this arch is an irregular-sided chamber about 3 feet high cut in the rock. On the side of the chamber to the right there is traced the outline of a round-headed arch, apparently designed as an entrance to connect these galleries with the south-easterly series of passages, a design not completed. In the opposite wall to this tracery is another passage carved in a singular and skilful manner. The pick marks are obliterated and the surface rubbed smooth. On the termination of this passage there is an arch, being the commencement of another passage but left unfinished as a mere recess. There are marks, however, of preparations for erecting a door. On the left hand the passage proceeds almost due east, and at the junction of these passages there is some appearance of groining in the roof. Proceeding along the main passage, now about 9 feet high, there is a hole in the ceiling as if a light was suspended at this point. At the further end to the right is another tracing of an arch of a doorway, apparently designed to communicate with the others by another series of galleries. The passage then comes to an abrupt termination forward, but turns to the left in a northerly direction. Near this angle are a number of holes in the wall, some made in a slanting direction as if intended to retain better the wood with which they were plugged for fastenings, which no doubt were used for detaining prisoners. At the end of the passage, high above in the roof, is a large hole running forward to the east. It had been tested for about 15 feet, but the outlet had not been found. It was believed to have been for ventilation.

Proceeding down the short passage to the right it is found to end abruptly, but to the right again in a backward westerly direction is a peculiarly-shaped round domed chamber, separated only from the two adjoining passages by a slight thickness of rock. There are two concave bassetts like fireplaces side by side. In the top of the pillar opposite to the right hand of the doorway are more holes for fastenings, arranged in such a manner that the detention of prisoners is immediately suggested to the mind. There is no chimney to this chamber, and though there is a quantity of black ash on the floor (the late custodian stating that some inches covered the floor at one time), yet the walls are not blackened, leaving one to suppose that the fuel employed was charcoal. There is yet another fireplace in the thickness of the wall of the archway. It is extremely difficult to suggest any apparent use for this small chamber and its fireplaces other than a sinister one. Several notches cut in the walls appear to have been used for the support of planks or beams, but no system of arrangement has yet been discovered. Returning again to the starting-point, and taking the stairs leading in a south-easterly

direction, it will be noticed that the roof is constructed in masonry in a similar manner to the other staircase. The six rock-hewn steps wind round a pillar of rock on the left side of the doorway. The state of the steps here is very different to the former stairs, and appear hardly to have been used. When first discovered they were filled in with *débris* which had come in through the broken roof masonry near the foot of the stairs. On clearing away the *débris* the earth continued to run in as fast as it could be cleared out, so that a wooden lineal shelf had to be sunk through the "made earth" from the surface between the wooden palings in the castle mount and the curtain wall. The first attempt proved unsuccessful, and when the excavation was nearly completed bad weather came on and the shaft collapsed, the workmen narrowly escaping with their lives. However, a second attempt proved successful, the roof was repaired, and six stairs were found leading into a small round chamber. Outside the right of this chamber appears another arch entered by two steps and opposite a small round-headed niche as if for a light to be placed. The passage suddenly terminates in the tracing of an arch.

Among the *débris* was found a number of animal bones and a small fragment of carved white marble, portion of the head of a statuette, probably belonging to the old chapel, which had fallen in with the *débris*. Portions of the foundation of the great castle curtain wall were exposed on the left hand. These were composed of water-worn stones from the shore, the limpet shells still clinging even after the lapse of eight centuries. It is now quite certain that these excavations have been left in an incomplete state for two reasons. The original designers were under the impression that the sandstone rock was of the same texture throughout, whereas it appears that only a belt of hard sandstone rock exists of a sufficiently sound nature to tunnel. Probably the masterly curving and twisting of the passages is due to the desire to keep within the solid belt. Every attempt on the part of the old workmen to extend the passages was thwarted by the rock to the south being of an unsubstantial nature, while on the north but little remained between them and the outside of the castle bank. However, the discovery is of extreme singularity, and is a unique addition to the already intensely interesting old castle. There appears to be only one castle in England bearing resemblance in its galleries to these at Hastings, namely, Pontefract, in Yorkshire. In some places the description of the Pontefract galleries by Mr. Clark in "Mediæval Military Architecture" reads almost like the Hastings Castle galleries themselves, but at Pontefract occur pointed arches which appear to denote a more recent origin. There is a growing tendency among writers to classify all galleries as storehouses for use in case of siege or as means of drainage. The galleries at Hastings do not appear suitable in design for either of those purposes. Moreover, among the ancient denizens of the castle it is to be feared, from documents which have lately come into the hands of the excavators, that there were persons of unpleasant and unscrupulous character and morals to an extent which in later times we could hardly conceive possible. Were not their convictions attested by the bishops of their own period? The Earl of Chichester deserves thanks for his kindness in allowing these researches to be undertaken, and it is hoped that at a future time more much-needed exploration may be carried out for the purpose of acquiring a better knowledge of this most interesting castle.

ARCHITECTURE AND WORSHIP.

AT the Church Congress in Exeter, among the papers read was one by Mr. W. B. Richmond, A.R.A., on "Architecture and Decoration as Aids to Church Worship." He said it was tempting in these days, which were full of puerile as well as offensive novelties, such as the new art, the new literature, new criticism, and other products of the signs of decadence, to fold one's hands and watch the progress of events, and to become more and more conservative, lest, by any chance, any statement or criticism might place one within the rank of the progressive prigs. Art was a subject worthy of the consideration of such meetings, because, while it had become a dependent on the Church, it was once one of its buttresses. Though it was not to be apprehended that any one of his audience desired our sacred edifices to be decorated by the new art, or that new literature and criticism should poison our inherited ideals, it was to be presumed that they all wanted an improvement or the present state of ecclesiastical art. They would like to revive methods of work, and to weaken the strictly commercial spirit by which religious art was environed. Churches were the palaces of an invisible King, into which had flowed so abundantly the highest achievements of man's creative powers when the Church was in active union with art of all kinds. Those palaces of the King could be of two kinds—noble by their grave austerity, as the cell of St. Francis; or resplendent with silver and jewels, mosaic and marble, as the shrine of St. Mark upon the shores of the Adriatic. There was, how

ever, a medium below these which could not be desired. A shoddy concern, and the art by which it was maintained, was of that character—indifferently theatrical and quite ephemeral. There was a plethora of it grown as well as growing. This was a result of ignorance prompting a desire for trash, and a sign of vulgarity which demanded ornament under all circumstances. It also demonstrated a want of discrimination and an absence of reserve so characteristic of a class which longed for Brummagem, and adorned itself with sham jewellery and artificial flowers. The evidences of its existence were shown in a great deal of modern art, and it had crept already into ecclesiastical structures and their appointments. Carvings were made to order, run out cheaply from those in stock; a commercially turned-out reredos was erected on a well-known pattern, bearing considerable resemblance to a Twelfth cake, naïf, perhaps, with a little sugar-plum mosaic, rivalling by its insel brilliancy the Christmas crackers. Maybe some ill-carved and commonplace saints occupied niches, or an oil-picture, the copy of an old master, resembling an oleograph, might depress still more the monotony and dulness of the whole design. The stained-glass window was a great fetic of the pious world, and there was a great trade in that commodity. It was of two kinds, the trade and the art window, but, granting that there were a few notable exceptions, the one was pretty nearly as valueless as the other. Hundreds of both were turned out every year with machine-like precision and rapidity. In the place of robust design, full of meaning, and such manly work as the twelfth, thirteenth, fourteenth, fifteenth and even sixteenth-century artists made, we were asked now to accept mawkish sentiment, weak or pretty saints, who, if they were like their portraits, would have flinched from the gridiron and become hysterical in the Roman amphitheatre. The sacred central Figure of Christianity was too often misrepresented as a characterless weak man to whom no one would go for advice much less worship. Go to Chartres, Assisi, Santa Maria Novella, York, Tewkesbury, Rome, Verona, Orvieto, Wells, Venice, Lincoln, Exeter, and try to persuade themselves that the work was designed by architects and carried out by that trade, and they would fail to be so persuaded. Or go to some of our homely English churches before the parson and the tradesman-architect had had the temerity to pull them about and shave every particle of vitality off them. If they had lived in those days of intense life and feeling they would have seen the architect or the master workman (that was his proper name) employed on the building in common with his assistants; the sculptor, in reality the mason, busy revealing the treasures of his imagination, making the stones live under him; window painters painting their dreams directly on the walls like men. The causes of this change were manifold. Puritanical dread of idol worship had dismissed the painter and the image worker, and the opening of churches on a Sunday only had rendered it useless to make them beautiful. But the forces of centralisation had narrowed the sphere of art to of religion. Painters had filled exhibitions and neglected churches; decorators were regarded as little above house painters; in place of sculptors, third-class carvers were employed to execute from architects' feeble reflections of continental visits, and architects delegated to themselves the choice of tints and the ordering of colours. Superficially stated, the remedies were simple—to desire the best, to know the best, to spend no money but on the best. The middlemen must be a thing of the past; the Church authority must get into immediate and candid relation with the artists, whoever they might be; the painter and sculptor must be satisfied with moderate gains, leaving the idea of making a fortune to members of the Stock Exchange, and they would be in part paid by the happiness of doing healthy work. So we should regain something of what we had lost. In the place of feeble decoration we should have virile work, the Church would gather once more the sympathy of real artists, and she would thereby be strengthened, broadened and humanised, as well as refined.

A NEW "SURVEY OF LONDON."

MESSRS. A. & C. BLACK have for some time been making arrangements, which are now completed, for the production of a new "Survey of London." The last edition of Stowe and Strype's famous work was issued in 1754; Maitland's Survey appeared in 1756; Entick's Survey in 1766; Lambert's Survey in 1806; since that time, though there have been many books written on London, on parts of London, and on institutions of London, there has been no actual Survey of London. In this long interval London has extended far beyond the modest limits of its walls and suburbs of 1806. Then, the City, reckoning from Westminster to Vapping, stretched for little more than three miles along the north bank of the river. In its widest part it was no more than three-quarters of a mile. At the present moment the jurisdiction of the London County Council covers an area, including the old City, which is roughly seventeen miles long

by twelve miles broad. The whole of this area is to be included in the new Survey. The editor, director and the principal writer of the work is Mr. Walter Besant, F.S.A., who has made a study of London, not only in books, but in exploration of the streets, the occupation of his leisure hours for more than twenty-five years. His recent works on London and Westminster and his eighteenth-century novels sufficiently prove his qualification for the post of director. The work will not be a reproduction brought up to date of Stowe and Strype, but an entirely new work on a different plan. It will, however, include a perambulation such as is found in the former work, but of the whole "county" instead of the City only. This perambulation will take account of every important building, institution and company; every church, chapel, college, school, hospital, orphanage, almshouse, museum, library, &c., in the whole of Greater London. It will include things past as well as the things present; it will contain a history of London—its liberties, charters, trade, political power, religion, manners and customs, and it will present a picture of the great City as it is from every point of view. In short, it is the aim of the publishers and of the editor to erect a monument worthy of this great and venerable City which shall record its state and condition at the end of the nineteenth century. It is at present designed to complete the work in eight quarto volumes, and the first will, if possible, be published in the autumn of 1895, to be followed at short and regular intervals by successive volumes. It is needless to add that the work will be fully illustrated by maps and engravings. We hope, however, the publishers will endeavour to obtain technical assistance when the buildings are described.

THE RESCUE OF EGYPTIAN HISTORY.

IN a letter to the editor of the *Times* Professor Flinders Petrie writes:—The destruction of the monuments and historical record of Egypt, which is going on year by year, threatens soon to leave no history to be further recorded. Every season sees buildings ruthlessly destroyed for the sake of materials, and a host of objects plundered by the natives from towns and cemeteries, in order that they may be scattered without name or record among the tourist flock. Even those objects which pass into museums have lost most of their importance and of their value in losing all record of their original place and circumstances. The laws of Egypt may be excellent in theory, but in practice it is perfectly well known that hundreds of persons join in this destruction—yet no man is punished for it.

There is, then, the most urgent need of saving all that is possible by complete and careful excavation, in which the history and meaning of every object shall be traced and recorded as it is found. To any person not acquainted with the practical work of excavation it might seem that so long as things are not actually destroyed it does not matter whether it be an Arab or a trained observer that may find them. But there is generally more history involved in the position and details of a discovery than in the object found. Fossils are worth but little if their strata are unknown. More scientific material has been destroyed than preserved in many of our excavations—even by Europeans and Egyptologists.

To avoid this prevalent system of mere plundering, trained hands and heads are needed to observe and to record. Such is the scarcity of suitable workers at present that even the Egyptian Government is obliged to leave most of its excavation in the hands of natives, from whom no record is ever obtained or expected. Before we can begin the salvage of the wreck, which is breaking up fast before our eyes, we need men who can put information in a permanent form as they discover it. In short, scientific training is indispensable.

But at present there is no means of acquiring such training. The Egyptian Government is concerned to keep its antiquities safe and to find objects for its museum. The French school, liberally maintained by the French Government, is concerned with the desirable work of copying, reading and publishing inscriptions. The Egypt Exploration Fund is concerned with excavating temples and finding big monuments, and it has never supported any students. There are no regular and independent workers of any nationality except one or two English. No public body does anything for the great subject of the civil life, archaeology and anthropology of the country, and there is no place where any student can get training in the very elements of archaeological research.

There is no lack of men willing to do such work; several have applied to me since Egyptology has been at last publicly established at University College. My earnest wish is to be able to encourage such workers and to see a sound British school of scientific archaeology established in Egypt. The first and most essential step is to be able to help men who come forward, and to cover their expenses and costs of work. The historical results and the objects procured by excavation in any

reasonably good site are an ample justification of the cost incurred. I have never had cause to repent of a single year's work out of the twelve years that I have spent; not one year would I have back again at the price of losing its results.

The aim of the Egyptian Research Account which is now established is not to undertake great clearances or exploits in the country, but to fit men for work of the highest class archaeologically, and at the same time benefit our knowledge and our museums as far as may be, by means of their excavations. The organisation of such a scheme should grow up spontaneously to fit the requirements and opportunities that arise, and no cut-and-dried rules could be suitable to begin with. Until the need for other regulation may arise the present position is that Mr. Hilton Price, the director of the Society of Antiquaries, attends to the financial side of the receipt and custody of all subscriptions. A cordial response has been made in many quarters, and over 200l. has been received or promised in the last three months; but certainly far more than that is needed, and could be spent with full advantage in the coming winter. Audited accounts will be annually rendered, and a publication of the work done will be given to each subscriber. As to the actual work, I hope to superintend two or three able and suitable men whose expenses may be thus partly provided for, and who will work in the neighbourhood of my own private excavations year by year. A very good ground for such work has been applied for this year; and, without any cost whatever to the Research Account, I shall be on the spot carrying on my own work, and be able to help and guide the new enterprise. Whatever antiquities may be found in this work for the Research Account will be divided amongst public museums, with due regard to the localities of subscribers; but no money will be used in carrying great blocks, which might as well remain in Egypt.

The public should bear in mind that the English Government—true to its traditions—does nothing whatever for work in Egypt. The Prussian, French and Italian Governments have each executed grand and invaluable work by scientific expeditions and publications. The only action of the English Government has been to place English students at a great disadvantage in Egypt, by giving up all common international rights of theirs to compete for any public appointments connected with antiquities. The credit of English work must therefore—in face of these serious disabilities—rest entirely on the public spirit of individuals, according to the usual English system. I hope to see arise in the next few years an active and capable school of English workers who will worthily develop the study of the life and civilisation of Egypt which was so ably begun by Wilkinson; but such a school must depend upon the support of the intelligent public which will, I trust, be freely given to such an enterprise.

BABYLONIAN ANTIQUITIES.

SINCE the British Museum researches in Babylonia ceased at the end of 1882, the spade of the Arab digger has been at work for the benefit of different Bagdad dealers in antiquities, but with no little loss to science, seeing that for every object found by the lawless excavator about half a dozen valuable antiquities are destroyed.

Both the French and the Americans have, says the *Times*, been digging in South Babylonia for some years past; the former at Tel-Loh and the latter at a mound called "Niffir" where formerly Layard and Loftus excavated. With the exception of a few objects which have made their way to France and America, whatever they found has been taken possession of by the Ottoman authorities. It may be remembered that since Mr. Rassam's exceptional privileges obtained for him by the late Sir Henry Layard while Ambassador in Constantinople, which enabled him to send to the British Museum everything he found in Assyria, Babylonia and Armenia, the Porte has persistently refused to allow the agents of foreign museums to appropriate or export any antiquities out of Turkey. The consequence is that whatever is found in the excavations or obtained by purchase by such agents is taken possession of by the Turkish Government. Under these rules no fewer than forty-seven cases of antiquities from the American diggings and about 12,000 inscribed clay tablets of those of the French, discovered by M. Sarzac at Tel-Loh, have been appropriated by the Imperial delegate and sent to Constantinople.

At Sippara, or Sepharvaim (the site which was discovered by Mr. Rassam for the British nation about fourteen years ago), the Ottoman authorities have been carrying on lately extensive operations under the superintendence of a Latin priest. At that place a large collection of inscribed clay tablets have been found and despatched to the Turkish capital. According to calculation there must be at the present time no fewer than 50,000 newly-discovered inscribed objects at the Imperial Ottoman Museum in Constantinople, obtained from different Babylonian sites, and the Assyrian scholar may find there

ample store for his study, which might add materially to the existing knowledge of the ancient history of Chaldea and Assyria.

Two black basalt statues, covered with fine inscriptions, have also been found by the Arabs; one at Imjaileeba, the site of the great palace of the kings of Babylon, where Belshazzar was supposed to have held his impious feast, and the other in a cave near Nimroud, on the opposite side of the Tigris, about twenty miles to the south of Mossul. These images have also been appropriated by the Ottoman authorities and sent to Constantinople.

The greatest find by Arab diggers of inscribed objects that has come to light lately was at Tel-Loh, after M. Sarzac, the French agent, left. They discovered a large chamber full of inscribed clay tablets, most of which they sold to Armenian, Syrian and Jewish brokers for exportation to England, France, Germany and America. Part of the collection has already reached London and Paris, but the remainder has been seized by the Ottoman authorities at Bagdad, and some of the Arabs have been arrested and fined for breaking the law. Unfortunately, the local authorities "lock the stable door when the steed is stolen," because they try to stop the illegal digging when it is too late to prevent valuable antiquities from being destroyed through the negligence and apathy of the Turkish officials.

LUCCA CATHEDRAL.

REFERRING to our paragraph in *The Architect* of the 5th inst. with regard to the proposed restoration of this building, it is satisfactory to know that the cathedral is scheduled as a national monument, and that any money which the local committee may be able to collect will be expended in works of repair and reinstatement, under the direction of the Minister of Education and Fine Arts. Any design for alterations to the cathedral will have to be approved by the Minister, who is assisted by an able staff of assistants, and if the rules recently promulgated by the Education Department are adhered to in the proposed restoration, there will be little cause for regret.

GENERAL.

The Duke of Cambridge has opened the new technical schools built by the Corporation of Maidstone at a cost of about 12,000l.

Mr. T. G. Abercrombie, of Paisley, has been selected as architect for the new grammar school, which is to be erected in that town at a cost of over 18,000l. A swimming-bath, gymnasium and workshop may also be erected in connection with the school.

Mr. J. H. Craigie has been successful in the competition for the Alexander Thomson Memorial Prize, which is open to Glasgow students. There were six competitors.

The Royal Scottish Academy recently obtained a new charter. They have now applied to have the supplementary charter amended. The amendments appear to be directed to keep the Academy a close society.

The "Old Glasgow" Exhibition, which has been held in the Fine Art Galleries, Sauchiehall Street, closed on Monday evening. In regard to the representation of antiquities, it is thought improbable that such an historical exhibition can be equalled in future.

It is proposed to rebuild the Royal London Ophthalmic Hospital on a site between Peerless Street and Gayton Street, City Road. Messrs. Lander & Bedells are the architects.

Dr. Charles Rieu, formerly keeper of the Oriental manuscripts at the British Museum, has been elected to the St. Thomas Adams Professorship of Arabic, in succession to the late Professor Robertson Smith.

A Women's Hostel, it is stated, is to be built at University College, Aberystwyth, and the sum of 13,000l. is to be expended on it.

At a Meeting of the Langholm Burgh Commissioners a letter was read from the Duke of Buccleuch, offering as a free gift to the town of Langholm the town hall and its site. The building was recently renovated by the Duke, to whom it belongs.

The Report of the Manchester Southern Hospital, after referring to the donation of 70,000l. by the Lewis Trustees, says that the building of the new hospital has not yet been commenced, because various arrangements involving delay had to be made, and numerous changes in the former plans and in the scheme of administration of the two institutions had yet to be considered and matured. The committee, however, hoped that in the course of a few months these arrangements would have been completed, and meetings of the subscribers to that institution and also to St. Mary's Hospital would then be convened to consider the scheme of amalgamation, with a view to obtaining the consent of the subscribers.

The Architect.

THE WEEK.

TIME, the transformer, can point to novel undertakings, but not often is one more startling than the conversion of the great castle of Norwich into a museum and art gallery. The buildings are far more impressive than those of Dover or London. Whether King CANUTE or ROGER BIGOD was the creator, the castle was intended to resist the utmost that could be done by the military power of the time, and its strength was repeatedly tested. Originally there were three nearly circular concentric lines of defence, each consisting of a wall and ditch, enclosing a ballium or court; besides these there were the keep, in the innermost ballium, and a barbican or outwork to defend the entrance. The whole comprehended an area of not less than twenty-three acres. The keep, which dwarfs all the buildings near it, is 110 feet 3 inches from east to west, including a small tower, through which was the principal entrance; from north to south it is 92 feet 10 inches; its height to the battlements is 69 feet 6 inches. The interior consisted of two floors, with a basement about 24 feet in height. The walls in some places are 13 feet thick. It was a happy thought to utilise the grim stronghold for educational purposes. As the Duke of YORK, in opening the museum on Tuesday, said:—"This ancient castle and keep, which must have witnessed many strange and stirring scenes, is about to present itself in a new character. First a fortress, then a prison, there must have been more of sorrow than of joy in the history of its past. Now all this has been changed. The prison cells have been turned into a beautiful museum and fine art gallery, which will provide healthy recreation and instruction, not only for your citizens, but also for the people of the county of Norfolk." It is to be hoped that the rooms in the old building will be enriched by many works of art, but a visit will be always repaid by the consideration of the series of events exemplified by the new destiny of the castle, and which is as remarkable as the conversion of swords into ploughshares.

THE death of EDWIN CLARK on Monday night removes another of the survivors of the great engineers of the past generation. Born in 1814, he was young and vigorous when ROBERT STEPHENSON selected him as his principal lieutenant for the construction of the Britannia Bridge. The experiments which were undertaken in order to discover suitable "tubes" were made by EATON HODGKINSON, and the constructive works of the Menai Bridge were in charge of FRANK FOSTER, but the organisation of the whole undertaking was entrusted to EDWIN CLARK. Afterwards he wrote a book in two volumes on the bridge, which must always be prized as an engineering classic. The experience gained by Mr. CLARK in utilising wrought-iron he afterwards turned to account in the construction of hydraulic graving docks and canal lifts of that material. The block system of railway signalling was also introduced by him. For several years he was chief engineer to the Electric Telegraph Company. He carried out many important works in various parts of the world. EDWIN CLARK was one of the highest types of the modern civil engineer, and among all the varieties of his undertakings there are none which can be called failures.

THE Parish Councils Act is likely to be advantageous to lovers of the picturesque, for the duty of preserving footpaths and tracks, which, although of ancient use, cannot be considered as roadways, will be thrown on the new bodies. Hitherto the Legislature has left the defence of such rights in the hands of private persons or societies. Under the new Act, however, it is specifically laid down that a public right of way in a parish is not to be stopped, and a highway in a parish is not to be declared unnecessary and not repairable at the public expense without the consent of the parish council, and that consent is not to operate if a parish meeting dissent, and a month's notice has to be given to enable them to dissent. A parish council may also undertake the repair and maintenance of any footpath in their

parish. In view of this Act, and the obligation it casts on local authorities to take cognisance of matters that have hitherto been somewhat ignored, the footpath preservation societies will in future stand on a new footing. They will not be superseded, for useful work can still be done by such organisations in watching the operations of the Act and endeavouring to have the provisions carried out. There is, however, not much use in having means of access to picturesque spots if, on arriving, they are found to be degraded by advertisement boards.

A COMPETITION was lately arranged in Mayence for the new Protestant church, which has become a necessity. Beside the church there were to be two parsonages, a residence for the sexton, a meeting-room for committees, and connected with the church a baptistery, two confirmation halls, waiting-rooms, &c., were to be provided. Designs were submitted by five architects from Berlin, Darmstadt, Mayence, and Stuttgart. The Romanesque style was adopted by Herr OTZEN and Herr SCHWECHTEN; Gothic by Herr SCHWARTZE, and Italian by Herr KREYSSIG and Herr NECKELMANN. The judges have awarded first-class premiums to Herren OTZEN and KREYSSIG, second-class to Herr NECKELMANN, and have recommended the purchase of the remaining two designs.

AN International Convention of Master Painters and Decorators was opened on Tuesday in Manchester. Mr. SUTHERLAND, the president, explained that the object was to lay the foundations of a society which would have jurisdiction over the area of the United Kingdom, and which would have for its object the welding together into one harmonious fabric the trade, craft, or profession—call it what they would—of the painter and decorator. One resolution passed was that the members of the Institute of House Painters and Decorators and the painting trade generally should be advised to discontinue the practice of employing unattached boys, and that an earnest endeavour be made to revert to the wholesome habit of indenturing boys to the trade. A paper was read about the practice of hawking and selling by auction job lots of room-papers. It was declared by the Convention that the practice was inimical to the best interests of the trade, and that a committee be appointed to further consider the matter and report upon the same to the executive of the new association as a basis of concerted action.

THE interest which is taken in plumbing is shown by the returns of the examinations of the City and Guilds of London Institute. The numbers during the last few years have been successively 569, 684, 825, 988, and this year the number has risen to 1,253, showing an increase of 265, the largest yet reached. Of these 1,253 candidates 652 have passed, 192 in the honours grade. At the practical examination, which is optional and of sufficient difficulty to indicate that the candidate who passes is a skilful plumber, 450 candidates presented themselves, as against 293 in the previous year, and of these 202 satisfied the examiner. Of these 202, 168 also succeeded in the written examination, and will receive the certificate of the Institute. Owing to the large increase in the number of candidates, arrangements were made for the practical examination to be held in forty-four centres outside London, as against twenty-seven in the previous year, and in order to prevent any failure in the results of the examination, in consequence of a difference in the quality of the material provided for the candidates, all the material, consisting of sheet lead, pipes, and solder, was forwarded from London to the forty-four centres of examination. At each centre a local examiner was appointed to superintend and report upon the candidates' work, and at the close of the examination all the work was returned to London to be marked by the chief examiner. The amount of material used in this examination was 13 tons 12 cwt. There was also an increase in the number of candidates in plasterers' work. The quality of work sent up for examination is not yet of a high order. It is, however, expected that the encouragement given by the Plasterers' Company to the study of this subject, by the offer of valuable prizes, will lead gradually to a desire on the part of those engaged in the trade to profit by the opportunities of instruction which are now offered.

LANCASHIRE.*

AS Lancashire is so peculiarly modern in all things it needs some reflection to realise that the county has a very ancient history. It was therefore excusable for matter-of-fact people to maintain that the late MADOX BROWN was indebted to his imagination for a few of the subjects which are represented in the Manchester Town Hall. Any sceptics of that kind will be confounded if they glance over the pages of Lieutenant-Colonel FISHWICK'S volume, which is the latest addition to Mr. STOCK'S series of "County Histories." As we have more than once explained, there is no fixed plan for the histories, and in the case of Lancashire the author has treated his subject under the following divisions, viz. Pre-Roman Lancashire, the Romans as Conquerors and Rulers, Roman Remains, the Saxon and the Dane, the Normans and the Plantagenets (1066-1485), Lancashire in the Time of the Tudors (1485-1603), the Seventeenth Century, Religion, the Rebellions, Progress in the Eighteenth Century, the Dawn of the Nineteenth Century, and finally a chapter relating to local customs. It will be evident from the list that Lancashire is no creation of yesterday, and that it was the theatre of many stirring events.

From its natural character the county was a part of England that seemed to invite invaders. It was approachable from the sea on its western side, the pasture was so general it was attractive to nomadic tribes, the rivers served instead of roads and the mosses were useful as defences. It is evident from the remains that long before the Romans arrived in disciplined battalions, Lancashire afforded shelter to a succession of wandering tribes. In the parish of Rochdale neolithic implements were found in twenty-five places. Celts also, as in modern times, made their homes in Lancashire, and Brigantes, Segontii, Voluntii, &c., but these names may not express all the racial varieties. At Heathwaite Fell is a site of a settlement "near half a mile long by 700 yards wide, which has been encompassed by a stone wall originally 2 feet thick." At Holme Bank, Urswick, the settlement was arranged as a five-sided figure. Mr. SWAINSON COOPER has concluded from the enclosures of the Furness district that they belonged to settlers who were able to live in peace with their neighbours, for there are no remains of a fortified structure. It is supposed "the smaller courts were the living apartments, and were no doubt covered with some kind of roof; the larger enclosures were for the cattle, or possibly for the lower order of tribes who held the place."

The natives were able to give trouble to the Roman invaders. Apparently JULIUS AGRICOLA, whose biography by his son-in-law, TACITUS, is one of the masterpieces of ancient literature, found it no easy task to 'subjugate a half naked people who were endowed with many estuaries and woods, which favoured barbaric warfare and were obstacles to heavily armed troops. In few parts of England were roads more necessary for strategic movements, and accordingly "the main Roman roads in Lancashire are all believed to have been constructed during the Higher Empire, that is, at or before the time of HADRIAN (A.D. 117-28)." A castrum was constructed where Manchester stands, and in 1773 WHITAKER gave a long description of the parts which had survived. The manner of construction can be inferred from one sentence in which he says "various parts of it have been fleeced of their facing of turf and stone, and now show the inner structure of the whole, presenting to the eye the undressed stone of the quarry, the angular pieces of rock and the round boulders of the river all bedded in the mortar and compacted by it into one." Around the castrum houses arose, but as a settlement Mancunium was inferior in importance to Ribchester on the Ribble, which was protected by the largest castrum in the county. According to a local doggerel:—

It is written upon a wall in Rome:

"Ribchester is as rich as any town in Christendom."

The number of articles found in the neighbourhood suggests that the verse-maker was supported by evidence enough. Lancaster was another Roman settlement where the castrum has been superseded by the castle and church,

and the boundaries are no longer discernible. Among the relics found in the city was an altar dedicated to MARS COCIDIVS, a British god who was permitted to enter the Roman Pantheon. After four centuries of foreign occupation the natives had advanced,—"the culture of the land was improved, the people were shown how to make roads and build houses of stone, mines were opened, iron was smelted and shops were built."

When the Romans departed Lancashire declined in civilisation. It became part of Northumbria, and subsequently part of Deira. The Danes in turn took possession of it. For several centuries the people were enabled to test many varieties of oppression, as "at one time they were governed by kings of Northumbria, at another by kings of England; at one time they were ruled by only tributary kings, or even only by tributary earls; sometimes the Christian religion was upheld, and sometimes they were referred back to WODEN and THOR and ODEN." A few remains of the early Saxon possession have survived, but the condition of the county prior to the Conquest was not satisfactory, as will be seen from the following description by Colonel FISHWICK:—

In the time which immediately preceded the coming of the Conqueror, Lancashire must have been very sparsely populated; in every part of it there were vast forests and great stretches of moss and fern; agriculture was everywhere neglected; towns, in the modern sense, there were none; but here and there, clustering as if for protection round some Saxon thane's castle or fortified dwelling-place, were groups of wooden houses and rude huts, and scattered sparsely over the country were the clearings (*assarts* or *rods*) and the *tons* of the primitive settlers, with, in some districts, a wooden building doing duty as a church. Except where the old Roman roads were still in use, the means of passage from one place to another were difficult and dangerous; the people were of many tribes and nations—remnants of ancient British families, Angles, Saxons, Danes, Scandinavians and even Normans contributed to the general stock—and as there were many tribes, so were there various religions, although Christianity had now become the general accepted faith. But for all this, much had been accomplished by time and experience to prepare the mind of the people to accept the tenet that union is strength, and that only by an undivided kingdom could come peace, wealth and prosperity.

It is remarkable that in Domesday Lancashire is not comprised among the English counties. The divisions are to be sought in Cheshire or Yorkshire, in Westmorland or Cumberland. The fortunate retainers of WILLIAM did not value their acquisitions, any less on that account, nor were the immense forests less attractive to the Norman hunters. Nowadays it is difficult to associate Lancashire with forests, or to believe that not only individuals but whole districts were made to suffer for infractions of forest laws. But the importance of the county from its forests is evident when we find that "as late as 1697 a royal warrant was issued to the foresters and other officers of the forests, parks and chases of Lancashire, calling upon them to give annually an account of all the king's deer within the same, and also to report how many were slain, by whom and by whose authority."

The Norman lords erected castles at Clitheroe, Lancaster, Liverpool, Hornby, Fouldrey, Thurland and elsewhere. They were also most liberal in erecting churches and other ecclesiastical buildings. Colonel FISHWICK gives much information about the condition of Mediæval Christianity in Lancashire. The priory church of Lancaster appears to have possessed extraordinary importance. Furness, one of the offshoots of the Abbey of Savigni, in Normandy, was another favoured house. The community in course of time attained wealth, but a law case which arose about half a century after the suppression, reveals, from the glimpse it gives of monastic landlordism, that a man who was one of the tenants was not rack-rented, and was in an enviable condition if compared with the vassal of a secular lord:—

Between the abbots and their tenants there appears to have been carried on a system of barter and exchange, some of the details of which are preserved in the evidence brought forward in support of a petition made in the duchy court in 25 Elizabeth (1582-83) by the tenants of Walney against the Queen's Attorney-General, who had obtained a lease of the late dissolved monastery. One of the witnesses, who was then seventy-eight years old, said that they (the petitioners) and their ancestors, whose estates they severally held, used to pay and deliver to the abbot certain "domestical" provisions, such as calves, sheep, wheat, barley, oats and the like, and for recompense they not only enjoyed their burgages or messuages, but also received from the abbey great relief, sustentation and commodities for themselves and their children, viz. all the tenants had weekly one ten-gallon barrel of

* *Popular County Histories: a History of Lancashire.* By Lieutenant-Colonel H. Fishwick, F.S.A. London: Elliot Stock.

ale; the tenants of Newbarns and Hawcoat had all the worthings (manure) of all the horses and oxen (except those at the abbot's stables); the tenants had also a weekly allowance of coarse wheat bread, iron for their husbandry, gear and timber for the repairs of their houses. In addition to these grants, all tenants who had a plough could send two men to dine at the monastery on one day in each week from Martinmas (November 11) to Pentecost (Whit Sunday); and the children of the tenants who had found the required provision were educated in the school of the monastery free, and allowed every day a dinner or a supper; and if any of them became good scholars they were often made into monks. The question at issue between the tenants and the Attorney-General was that whilst he demanded the provisions, he claimed exemption from making the recompenses, alleging that the abbots had merely given the food out of benevolence and devotion to their neighbours. The result of the petition was in favour of the tenants.

Another fine church, and happily well preserved, is at Cartmel, and belonged to the Augustinian Canons. The Præmonstratensians possessed two houses at Cocker-sand and Hornby. Whalley was a Cistercian abbey, and according to WHITAKER the community "continued for two centuries and a half to exercise unbounded hospitality and charity, to adorn the site which had been chosen with a succession of magnificent buildings, to protect the tenants of its ample domains in the enjoyment of independence and plenty, to educate and provide for their children, to employ, clothe, feed and pay many labourers, herds-men and shepherds, to exercise the arts and cultivate the learning of the times." It was one of the conditions of monastic benevolence that the receiver was not humiliated, and if kindly feelings towards Roman clerics still exist in Lancashire the origin may probably be traced to old obligations. The people are not of an ungrateful turn, and we can understand why at the time of the suppression "there was a very strong party in favour of the old form of religion; and this wholesale doing away with the institutions which had so long been established in their midst met with almost open rebellion." Certain rural parts were the greatest losers, for it is remarkable that "in what is now the diocese of Manchester, between 1291 and the suppression there were not a dozen churches erected, whilst during the reign of HENRY VIII. seven were built." We are not to suppose that the seed of the reformed doctrine fell on stony soil throughout Lancashire. The county supplied two of MARY'S victims as well as many exiles, but it was on the whole the most steadfast part of England in clinging to old beliefs.

While so many were contending over doctrine, trade was working out its destiny. Manchester in 1533 was already reputed as the foremost among English towns for textiles, but of the woollen sort. Science had not in those days revealed the knack of deception. The manufacturers were ignorant of chemistry, and as a result we learn from LELAND how, in consequence "of their honesty and true dealing, many strangers, as wel of Ireland as of other places within this realme, have resorted to the said towne with linnen yarn, woollen and other wares for making clothes." Liverpool, which we suppose was accepted as a rival of Manchester in the sixteenth as in the nineteenth century, was supposed to have fallen into decay under HENRY VIII. The port was treated as a dependency of the port of Chester, and in 1558 it possessed only a dozen vessels, the largest having a burden of 40 tons. Prosperity was, however, coming towards the Mersey as well as to other parts of the county. The Tudor times could not be entirely perfect, and for men who were stubborn and faddish they were not agreeable. The builders of Lancashire at least could not complain of the effects of the transition from feudalism:

The towns and villages greatly increased in number, size and importance, and the time of Elizabeth especially witnessed the erection and rebuilding of some of Lancashire's finest halls. The ancient domestic houses which had been the residences of the old feudal lords were now remodelled or entirely swept away, and the subdivision of the land brought out a new class of proprietors who, though not descended directly from the old owners of the soil, soon took up the rank of gentry, and built for themselves those smaller though not less interesting mansions which at one time were found all over the county. During the Tudor time were built such houses as Speke Hall, near Liverpool; Ordsall Hall, near Manchester; Little Mitton, the home of the Sherburns; Ince Hall, Cleworth Hall, Smithells Hall, Lostock Hall, Lydiat Hall, Rufford Hall, Belfield Hall, Rawcliffe, Rossall Grange and a host of others far too numerous to mention. Many of these date back to very early days, and were originally built with a view to make every man's house his castle; but with the end of the sixteenth century other views began to obtain, and an Englishman, for the first time probably in the country's history, commenced to feel that

his house was really his castle, and that it was defended for him by the strong arm of the law.

A constructive period of similar importance is not to be traced in the history of Lancashire until the close of the eighteenth century, when King COTTON attained a power of which Queen BESS could not dream. Before that time was reached the county was destined to pass through much tribulation. The Civil Wars have cast their shadow over the seventeenth century, and the Jacobite rebellions over the eighteenth, while the contemporary struggles of industry appear of no account in the turmoil. HARGREAVES'S spinning-jenny, KAY'S flying shuttle, ARKWRIGHT'S rollers and CROMPTON'S mule were insignificant to those who were proud to wear Prince CHARLIE'S cockade. BRINDLEY and the Duke of BRIDGEWATER were likewise not revered as historical personages. The Muse of History, like other hangers-on of mythologies, has had, however, to submit to Fate, and is obliged to record that the universal influence which Lancashire has gained and the new power which enabled England to resist Europe in arms were conferred by those mechanics.

It is a strange story which the historian of Lancashire has to relate. A man who is romantic is no more fitted to relate it than one who is of a theological turn. The county has been everything by turns, and nobody could venture to say how many variations are to pass over it. Colonel FISH-WICK seems to us to be proud of the present and sanguine about the future state of Lancashire, but his modernity does not permit him to treat the past with contempt. He seems to have sympathy with all periods, and his volume has attractions which are rarely found in books which pass for histories.

GREEK SCULPTURE IN RELIEF.

AS a general principle the Greeks considered the ground of figures in relief to be the real wall, or whatever the solid plane might be, and not to represent air as if it was a picture. The art with them was thus rather the union of sculpture with architecture than a union of sculpture with the conditions of painting. That this was founded on the most rational principles will be evident from a few simple considerations. The shadows thrown by figures on the surface from which they project at once betray the solidity of that surface. In the attempt to represent, together with actual projection, the apparent depth of a picture, or to imitate space, figures which are supposed to be remote are reduced in size; but although thus diminished in form, they cannot have the strength of their light and shade diminished; and if deprived of shadow by inconsiderable relief, they cease to be apparent at all when the work is seen from its proper point of view, that is, at a sufficient distance, having no distinctness whatever in the absence of colour, but by means of light and shade. In short, the art thus practised has no longer an independent style, and only betrays its inferiority by presenting defects which another mode of imitation can supply. A passage in Vitruvius proves that the ancients were not unacquainted with perspective, and the same author states that perspective scenic decorations were first employed by Agatharcus at Athens in the time of Æschylus. However greatly the science may have been advanced by the moderns, this may be sufficient to prove that the absence of perspective in Greek bassi-relievi was not from an absolute ignorance of its principles, but from a conviction that they would be misapplied in sculpture.

In carefully keeping within the limits, however narrow, which defined the style of rilievo, the great artists of antiquity failed not to condense into that style the utmost perfection compatible with it, while the various applications of the works suggested abundant variety in their treatment and execution. The British Museum contains unquestionably the finest existing specimens of this branch of sculpture in the rilievo which decorated the Parthenon, or Temple of Minerva, at Athens.

The figures which adorned the pediment are separate statues, although in their original situation, casting their shadows on the tympanum, they must have had the effect of bold alti-relievi; the circumstance of their being thus completely detached must have given the greatest distinctness to their forms, and as they occupied the highest part of the building, their gigantic size and complete relief made them fully effective at a considerable distance. The sculptures which adorn the metopes or spaces between the triglyphs are in alto-relievo. Those in the British Museum, representing combats with the Centaurs, were taken from the south side of the building; the subjects were varied on the other side, but they mostly related to the warlike exploits of the Athenians. It has been well observed that the subjects of combats, usually chosen for the

metopes in Doric temples, afforded opportunities of composing the figures so as to produce diagonal lines, which effectually distinguished the groups from the architecture, and at the same time had the effect of reconciling the vertical forms of the triglyphs with the horizontal lines of the epistylum and cornice. The compositions in question all fully occupy the space destined for them, and are calculated, from their treatment and relief, to produce the utmost possible effect.

Those works which received the open light were thus boldly relieved from their ground to ensure the masses of shadow which make them conspicuous; the principle, applicable to external architecture, that projection commands shade, was thus extended to external decorations; and care seems to have been taken to keep the light on the figures as unbroken as possible, especially as the whole series of metopes occupying the external frieze was more or less crossed by the shadow of the cornice. This precaution necessarily limits the attitudes, for many actions equally natural with those adopted would have projected shadows on the figure itself, thus tending to confuse the forms. A statue which can be seen from various points and sometimes in various lights might thus be unfit as to its composition for that intelligible display in one view and under a constant light which rilievo requires. On the principle that high relief is fittest for the open light, the rilievo of the temple of Phigaleia, which are also preserved in the British Museum, are bold in their projections. These works adorned the interior of the cella, but as the temple was hypæthral, or lighted from the open sky, the principles of external decoration were applicable. Had the temple been imperfectly lighted, a flatter kind of relief would have been preferable, and this leads us to consider the style of *basso-rilievo*, properly so called, the most perfect existing specimen of which is also in the British Museum. It adorned the external wall of the cella of the Parthenon within the peristyle or colonnade, and was consequently always in shade; the strongest light it could ever receive would probably be the reflection from the pavement below when the sun was highest, but as reflected lights are uncertain and may proceed from various points, the sculptures in question were calculated to be equally distinct in whatever direction the light was thrown. Their great elevation, and the peculiar angle at which they were seen, owing to the narrowness of the space between the exterior columns and the cella, may also be mentioned in considering the reasons which rendered projection unavoidable. That this confined view was not, however, the sole reason may appear from the bold relief of the Phigaleian marbles, which, in the interior of the narrow cella of the temple they adorned, must have been seen on the side walls at a very inconsiderable distance compared with their height. The Phigaleian temple was built according to Pausanias, by Ictinus, the chief architect of the Parthenon; and although the sculptures are inferior, as works of art, to the generality of Greek specimens, their style of relief is precisely the point where the architect may be supposed to have influenced their execution.

As projection commands shade, so flatness commands light, and the flattest relief is hence fittest for an invariably dark situation. The same principle is observable in architecture in the treatment of mouldings in interiors, the form and projection of which differ materially from the corresponding members in the open light, and which are intended to be seen at a distance. The flatness which insures light would, however, be altogether indistinct and formless unless the outlines were clear and conspicuous at the first glance. The contrivance by which this is effected is by abruptly sinking the edges of the forms to the plane on which they are raised, instead of gradually rounding and losing them. The mass of the relieved figure being sometimes very little raised in its general surface, its section would thus almost present a rectangular projection. In many instances the side of this projection is even less than rectangular; it is undercut, like some mouldings in architecture which require to be particularly distinct, and thus presents a deeper line of shade. But if the figure can thus command distinctness of outline, notwithstanding the inconsiderable light it may receive, it is obvious that its lowness or flatness of relief will in such a light greatly aid its distinctness; above all, this contrivance gives the work thus seen in an obscure situation the effect of rotundity. Indeed, it is a great mistake to suppose that the flat style of relief was intended to appear flat, and it is a great mistake to apply it in situations, as in the open air, where it must appear so, and be indistinct besides. The conventions of the arts are remedies, adopted in certain situations and under particular circumstances, and are supposed to be concealed in their results; their ultimate resemblance to nature, and their successful effect in those circumstances, are the test of their propriety and necessity. The absence of all convention in *alto-rilievo* (as opposed to the flat style) thus fits it for near situations, if not too near to expose it to accidents. The excellent sculptures which decorate the pronaos and posticum of the Temple of Theseus, although under the portico, are in bold relief. They were not only nearer the eye and seen at a more convenient angle than the flat rilievo of the cella of the Par-

thenon, but the reflected light which displayed them would necessarily be much stronger.

It is also to be remembered that only the end porticoes, where the sculpture could be more conveniently seen and was better lighted, were decorated with rilievo; the side walls of the cella were unornamented, and undoubtedly bold relief would have been less adapted for them. The Temple of Theseus was built about thirty years before the Parthenon; and it is not impossible that the satisfactory effect of the flat rilievo on the cella of the latter might have suggested a similar treatment, or some modification of it, in the Temple of Theseus, had it been erected later. It may be observed, in general, that *alto-rilievo* can seldom be fit for interiors, not only from its liability to accident, but from the difficulty of displaying it by the full light which it requires. A superficial light, especially if in a lateral direction, necessarily throws the shadows of one figure on another. Instances of this occur in some of the palaces in Rome where works of sculpture have been injudiciously placed. A room, for example, lighted in the ordinary way will have its walls (at right angles with that occupied by the windows) adorned with a frieze in considerable relief; the figures nearest the light consequently project their shadows so as to half conceal the next in order.

The conditions of proximity and distance, as well as the quantity and direction of light, were carefully attended to by the Greek sculptors, and suggested new varieties of relief. The end of the art, as far as relates to execution, is accomplished when the work is distinct and intelligible at the distance whence it is intended to be viewed. Hence the conventions which are intended to correct the defects of distance, of material, want of light, &c., are evidently unnecessary where the work admits of close inspection. The style of *mezzo-rilievo*, which in its boldest examples presents about half the thickness of the figure, is, on many accounts, least fit for a distant effect; the figure is nowhere detached from its ground; at a very little distance its shadowed side is lost in its cast shade, and its light side in the light of its ground; the outline, in short, soon becomes indistinct; but the semi-roundness of the forms is directly imitative, and thus again the absence of all conventional treatment fits the work for near situations. The style was preferred to *alto-rilievo* in such cases, as the latter would have been more liable to accidents, and would besides in some measure deform the outline or profile of any object which is circular in its plan.

The *mezzo-rilievi* on the miniature choragic monument of Lysicrates may be admitted to have been fitly calculated for their situation because they must have been seen near; but there was in this case an additional consideration to be attended to. The building is circular, and *alto-rilievo* was avoided in order to preserve the architectural profile; on the other hand, the frieze of the small temple of Victory, which was rectangular, was adorned with *alti-rilievi*, and in this case it appears that they did not even extend to the angles. The objections to sculpture on monumental columns will be obvious from these considerations; it has been observed that in attempting to preserve the architectural profile, as in the Trajan column and its modern rival in the Place Vendôme at Paris, the sculpture thus slightly relieved soon becomes indistinct, nor indeed would this indistinctness be obviated at a considerable height even by *alto-rilievo*, the figures being necessarily small, while the evil is only increased by substituting the dark material of bronze for marble.

We proceed to consider the varieties of style in this art as affecting composition. In rilievo, and in sculpture generally (a colourless material, or a material of only one colour being always supposed), it is evident that shadow is the essential and only source of meaning and effect. In works placed in the open air, and visible in one point only, as in the case of *alto-rilievo*, a certain open display of the figure is generally adopted; the shadows, or rather the forms which project them, are so disposed as to present at the first glance an intelligible and easily recognised appearance, and the impossibility of changing the point of view, or changing the light, as before observed, limits the attitudes more than in a statue, and, as will also appear, more than in a *basso-rilievo*. For in the latter, however distinct the outline is in which the chief impression and meaning of the figure reside, the shadows within the extreme outlines are in a great measure suppressed; it is, in fact, by their being so suppressed that the general form becomes so distinct. This is also the case when one form is relieved on another; it will be seen that the nearest object is very much reduced and flattened in order that its shadow may not interfere with the more important shadows of the outlines on the ground, and hence it may often happen that the nearest projection is least relieved. It will thus be evident that, owing to this power of suppressing the accidental shades, and preventing them from rivalling or being confounded with the essential ones, the choice of attitudes becomes less limited, and many a composition which in full relief would present a mass of confusion from its scattered and equally dark shades, may be

quite admissible and agreeable in basso-relievo. Accordingly the attitudes of statues, which are generally unfit for alto-relievo, frequently occur in the flat style. Visconti even supposes that certain figures in the bassi-relievi of the Parthenon suggested the attitudes of celebrated statues afterwards executed, as, for instance, the Jason or Cincinnatus, and the Ludovisi Mars. As a remarkable proof how much the attitudes were limited in alto-relievo compared with the flat style, it may be observed, that the contrasted action of the upper and lower limbs, which gives so much energy and motion to the figure, is perhaps never to be met with in the fine examples of alto-relievo, whereas in the flat style it is adopted whenever the subject demands it. This disposition of the lower limbs, or the alternate action in which one of the arms would cross the body, never occurs in alto-relievo, because the shadow of the arm on the body or of one of the lower limbs on the other could then no longer be suppressed, as it is in this case, but would rival the shadows of the whole figure on the ground. Among the metopes of the Parthenon, the Phigaleian marbles, and the alti-relievi of the Temple of Theseus, there is not a single instance of the contrasted action alluded to, while in the two latter examples the contrary position, or open display of the figure, repeatedly recurs, even to sameness. It must, however, be admitted, that this open display of the figure, although not presenting the most energetic action, is as beautiful as it is intelligible, and hence the finest exhibitions of form were quite compatible with the limited attitudes to which the sculptors thus wisely confined themselves. The objections which compelled this limitation being however entirely obviated in basso-relievo by the power of suppressing at pleasure the shadows within the contour, we find the fullest advantage taken of the latitude which was thus legitimately gained.

A better example cannot be referred to than the flat rilievi already mentioned from the cella of the Parthenon. The subject represents the Panathenaic procession, and although no perspective diminution is admitted, several equestrian figures are sometimes partly relieved one upon the other. The confusion which results from the number of similar forms in the repetition of the horses' limbs, as well as in the actions of the horsemen, must be admitted; but perhaps the subject is thus better expressed than by a simpler arrangement, and this treatment contrasts finely with the single figures. In a procession of horsemen moving two or three abreast, we are at once aware that the figures are similar, and the eye is satisfied, as it would be in nature, not in searching out each individual figure as if it had a separate principle of action, but in comprehending the movement and the mass, for one indicates the whole. Where the figures thus cross each other they are treated as a mass; the outline of the whole group is distinct and bold, being more or less abruptly sunk to the ground, but the outlines which come within the extreme outline are very slightly relieved. In short, the principle here applied is precisely the same as that observable in a single figure in the same style of relief; the outline of the whole form is distinct, or rather most distinct where it is most important, and the internal markings are seldom suffered to rival it, but are made subservient to this general effect. The relative importance of the objects is, indeed, the only consideration which is suffered to interfere with this principle; thus loose drapery is sometimes slightly relieved on the ground, while a significant form is now and then strongly relieved even on another figure. In comparing the slight varieties of treatment in these rilievi, it is to be remembered that the end porticoes were a little wider than the lateral colonnades. It is undoubtedly to this circumstance that the difference of treatment alluded to is to be referred; the figures in the end friezes are more separated from one another, and consequently somewhat more relieved than the compact processions on the side walls.

The fact that these bassi-relievi, as well as most of the sculpture of the ancients, were partially painted, has been purposely left out of the account, because the very contrivances resorted to are calculated to supply the absence of colour. The ancient sculptors added colour after having employed every expedient which could supply its want, the moderns, in altogether rejecting it, often fail to make use of those conventions which its absence demands.

It appears that the principle of suppressing the relief within the extreme contour which, with the strong marking of the outline itself, mainly constitutes the style of basso-relievo, was employed by the ancients in works of considerable relief, in interiors, in particular lights, and probably at some distance or elevation. The real projection which works thus strictly belonging to the class of bassi-relievi may sometimes present, points out the essential difference between basso and mezzo-relievo—a work, even if in very slight general relief, which has the parts that are nearest the most relieved, belongs to mezzo-relievo; while a work which has the nearest parts least relieved, constitutes basso-relievo, whatever its general projection may be. In the former the outline is thus less apparent than the forms within it; in the latter the outline is more apparent than the forms within it. The early Greek and

Etruscan rilievi, which, however flat, have the nearest parts the fullest, while the outline is scarcely, if at all, rectangular in its section, have thus the principle of mezzo-relievo. They are even fitted for near inspection, and cannot be said to present any unsatisfactory convention; for the bulk, however really thin, is proportionate in its relief, and is so far directly imitative, inasmuch as the eye consents to a diminished scale of bulk as easily as to a diminished scale of height, while the indistinctness of the outline has the effect of rounding the form. Such works are besides fitted for near examination, because they can scarcely command any shadow.

The Egyptian intaglio, for so it may be called, rather than rilievo, belongs to the same style. The Egyptian artists, instead of cutting away the background from the figure, sunk the outline and slightly rounded the figure, on the principle of mezzo-relievo, within. Thus no part of the work projected beyond the general surface, and the architectural profile was preserved. There are, however, many very ancient examples at Thebes of figures slightly relieved from the ground, somewhat on the principle of basso-relievo, as practised by the Greeks—that is, with the nearest parts least relieved and with outlines rectangular in the section. Many of them probably in their original situations, and when the buildings were entire, ornamented interiors. The Egyptian rilievi were painted in brilliant colours, and would have been ineffective in the open light without such an addition.

The distinctions of the three styles of relief, according to the Greek examples, may now be thus recapitulated. In the highest relief, however decided the shadows may and must of necessity be on the plane to which the figure is attached, the light on the figure itself is kept as unbroken as possible, and this can only be effected by a selection of open attitudes—that is, such an arrangement of the limbs as shall not cast shadows on the figure itself. In basso-relievo the same general effect of the figure is given, but by very different means; the attitude is not selected to avoid shadows on the figure, because while the extreme outline is strongly marked, the shadows within it may be in a great measure suppressed, so that the choice of attitudes is greater. Mezzo-relievo differs from both; it has neither the limited attitudes of the first nor the distinct outline and suppressed internal markings of the second; on the contrary, the outline is often less distinct than the forms within it, and hence it requires and is fitted for near inspection. Its imitation may thus be more absolute and its execution more finished than those of either of the other styles.

ABERDEEN ARTISTS' SOCIETY.

THE annual exhibition of the Society has just been opened by the Marquis of Huntly, the president. Lord Huntly, in opening the exhibition, said he must protest at having been asked to perform upon a second occasion that very interesting ceremony. He did not, however, blame the committee for having done him the honour, because that was the second exhibition of what he might call the resuscitated Aberdeen Artists' Society. It was all very well to say, as he noticed the newspapers had done, that that exhibition was the seventh that had been held; but he might remind those present that there was a hiatus in the history of the Aberdeen Artists' Society, and it was only by the active exertion of a few ardent friends that the Society again came into existence four years ago. They were now met that day to open the second exhibition of that resuscitated Society; and he thought he might say on behalf of the Society that they were not ashamed to ask the public of Aberdeen to come and see the collection of pictures that had been got together. It was a collection of pictures that not only showed great advance on the part of the artists of the present day, but it also brought before the public of Aberdeen a collection of works of those who had gone from them, which any part of the country would not be ashamed to see in their midst. They had to thank a great many citizens of Aberdeen for the interest they had taken in the Society. He would not mention their names, for they were known to most of those present; but he could not forbear mentioning publicly the debt they owed to their indefatigable secretary, Mr. Emslie Smith. Proceeding, Lord Huntly said he had only two words to say in connection with the exhibition. The Aberdeen Artists' Society did not exist only for the purpose of collecting works of art for the benefit of those who were able to come in the daytime to see them, but its aim was to produce an exhibition, and to open it to the public at such a low cost that every man, woman and child in Aberdeen could come and see it and have relaxation in these rooms. They had to thank the managers of the Art Gallery for placing the rooms at their disposal, and they did their best to meet this kindness of the managers by opening the exhibition in the evening at a most reasonable cost, in order that every person in the town might have an opportunity of seeing it. He hoped the citizens would be as responsive on this occasion as on the last, and if this was

so the Aberdeen Artists' Society would indeed continue to be, as it was now, in a very thriving condition. The only other word which he had to say was that they had endeavoured in the exhibition to produce some of the works of a great Aberdonian artist, John Phillip. He alluded specially to his works in order to point out to those who looked at them that they would see in the earlier efforts of Phillip a very different style from those of his later works; in fact, one could hardly believe it was the same artist that painted the magnificent picture on his left (*The Early Career of Murillo*). This work would show to the rising artists of the present day that where a man had any love of his art and worked steadily at it he could rise to even as great a position as John Phillip did, and he trusted there were some amongst them in Aberdeen who would leave as imperishable a name as Phillip did.

GEORGE FREDERICK WATTS.

THE first of the series of Saturday evening lectures on art subjects to be given this season was delivered in the Glasgow Corporation Galleries by Rev. Malcolm McLean, B.D., of Brodick, who took for his subject "George Frederick Watts, R.A." The chair was occupied by Bailie Shearer, the convener of the galleries committee, who, in introducing the lecturer, expressed the gratification of the galleries committee at the appreciation with which the lectures had been received by the public, and indicated the nature of the series of which this was the first. The lecturer began by giving a short account of the painter's early art career and the hopes he entertained through fresco-painting of elevating the character and broadening the sphere of art in the country. The scant encouragement given to him in this direction, without altering his ideas of the aims of art, made him work them out in his own studio. Throughout his long career, as the lecturer showed, he had been true to the purpose which he believed all high art ought to serve—preserving what is valuable in the national character, interpreting what is difficult in life and reconciling men to the harder decree of destiny. A tribute was paid to Mr. Watts's power as a portrait painter, and to the fact that many of the most distinguished men of the age had sat to him—statesmen, divines, &c. The allegorical side of Mr. Watts's art, the side by which he is best known, was then dwelt upon, comparing him in this respect with Albert Dürer and William Blake. The lecture closed by a summary of the painter's philosophy of life, as shown in his various works. Mr. McLean's lecture, which was listened to with the closest attention, was illustrated with a beautiful series of slides from the works of the artist.

KEIM'S MODE OF WALL DECORATION.

A LETTER in the *Times*, from Mrs. Lea Merritt, gives the following account of another process of wall decoration:—The beautiful mosaics designed by Richmond in St. Paul's Cathedral have certainly given a new impulse to ecclesiastical art, and at this moment many may wish to beautify their churches who have not the means for this gorgeous and expensive method, undoubtedly the most beautiful. Painting in fresh plaster, as successfully practised in Italy, is entirely unsuited to our climate, for the plaster itself decays very quickly under the influence of the moisture and carbonic acid gas in the atmosphere. Oil pictures on canvas glued to the wall generally show some glossy surface. The glue in damp weather permits the canvas to sag or expand. Tempera painting is equally perishable. The spirit medium lately introduced does not harden the plaster on which it is painted.

There is, however, a method of which a first experience has been made during the past year on the walls of St. Martin's Mission Church on Blackheath, near Chilworth. It is the invention of Adolf Keim, of Munich, and in that city has been extensively used. The walls are prepared in a scientific manner, eliminating lime almost entirely. The painting-ground consists of marble dust specially prepared with a proportion of infusorial earth. This, after being laid on the rough-cast, is prepared in such a way as to become very porous and firm of texture. The painting is done with colours ground in distilled water, and only chemically pure water may be used. The pigments are of a wide range and fine quality. The work is carried out necessarily with that precision and simplicity which the old fresco method enforced, but one may have the advantage of retouching a little at the last. The colours are finely set by a series of careful applications of a kind of silicate, applied very gradually and with reference to the varied absorbent qualities of special colours. When the fixing is complete the surface is exceedingly hard. It requires great force to break it, and the painting, which has no gloss, but a beautiful, neat, granulated surface, may be washed freely, or will even resist exposure to rain and open sunlight.

At present artists using this method will have to import the colours and chemicals, but there is expectation that they may soon be made in this country. The preparation of the wall was done by a country builder, following the directions given from Munich.

The church—and it is a most beautiful and original little model, designed by Mr. C. Harrison Townsend—is quite near Chilworth Station, on the South-Eastern Railway, and I shall be very happy to give all information about the process to any artist desiring it. Of the pictures now complete, that of *The Resurrection* is not yet entirely fixed in some of the darkest colours. The other paintings may be washed or tested in any way.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the meeting of this Society, Mr. A. N. Paterson presiding, a lecture was delivered by Mr. P. McGregor Chalmers on "The Abbeys and Cathedrals of Scotland." He pointed out that local tradition, however interesting, was but a fabric reared by memory and imagination; it could aid us but little where scientific accuracy was required. It might be thought that in the mass of literature published since Scott revived the interest of Scotchmen in the beauty of their own country and its history there would be found all the material necessary for the history of our abbeys and cathedrals. Closer acquaintance, however, convinced one that it was seldom more than a local tradition. The writers generally have been men of culture, but with exceptions they had no knowledge of art. Turning to ancient charters we might think to have at last found some foundation, but the writings of past ages had been a most prolific source of error. An illustration in point was in the charters relating to the building of the central tower of Glasgow Cathedral, a part of the erection commonly attributed to Bishop Wishart. The lecturer said this was erroneous, and that the tower really erected by Wishart, and restored by Lauder, was the north-western tower, so foolishly removed sixty years ago. It was a favourite practice for a local magnate or chief prelate to have his arms carved on the building erected or restored by him, and in this connection he argued that the arms of Archbishop Blackader, which appear on the remarkable aisle of Car Fergus, were not a record of building, but only of restoration. The presence of names or arms was not an infallible guide in study; that infallible guide must be found in art itself.

TESSERÆ.

Architects' Certificates.

A CERTIFICATE that the work has been done in a satisfactory manner means a document or expression (it may be by word of mouth) which states the fact directly or indirectly; and a letter from the architect merely enclosing a builder's account checked by him is not a certificate. The certificate is valid without reference being made in it to the amount that may be due to the builder. When it is stipulated in the contract between the employer and contractor that a written order must be given for extra work and no such written order is given, yet if the architect at the end of the engagement makes a certificate allowing such extra work, it is conclusive and final, unless his conduct has been fraudulent. If the parties to a building contract expressly stipulate that the certificate of the architect shall not be set aside on any ground, or on any charge of fraud or collusion, then, even if fraud on the part of an architect is proved, the certificate is binding.

St. Pancras Church and the Inwoods.

The Classic church which was the conjoint work of William Inwood and his son Henry, is in its kind and in its peculiar beauties unique among the churches of the Metropolis. The building was commenced July 1, 1819, was completed May 7, 1822, and cost 76,769*l*. The exterior of the body of the church is with certain necessary deviations an imitation of the Ionic Erechtheum on the Acropolis at Athens; the tower is an adaptation from the building commonly called the Tower of the Winds, also at Athens, which is properly the Horologium or water-clock of Andronicus Cyrrhestes. The measurements and drawings of these buildings were made by Henry Inwood on the spot. The semicircular apsis at the east end of the church supplies the place of the straight west wall of the Pandrosion or temple of Pandrosos, which adjoined the Erechtheion at the west end. The two covered buildings which project from each side of the east end, forming the entrances to the catacombs of the church, are adaptations from the south portico of the Pandrosion. The caryatid figures, of which there were six, four in front and one at each side, were in the place of columns and supported the pediment of the south portico of the Pandrosion; the opposite north portico had

columns. There is one of the original caryatid figures in the Elgin-room of the British Museum. The sarcophagus beneath each roof indicates the purpose for which the projecting buildings have been constructed. The two Ionic half columns engaged in the walls on both sides of the west end are additions made to form an apparent basis for the tower. The windows are adaptations modelled in accordance with the form of the doors. Grecian temples had no windows; large temples had a central portion of the roof open to the sky; small temples generally received light only from the door, which was wide and lofty. The octagonal tower, with its two ranges of eight columns each, in its form and general effect combines well with the building and portico, and is in itself an object of peculiar beauty. In the interior the galleries are supported by very elegant slender columns. The ceiling is flat and formed into a number of ornamented panels. The general effect of the interior is good though rather deficient in light, especially below the galleries, from the small size of the windows. William Inwood was born about 1771. He was brought up to the professions of architect and surveyor. He was employed as steward to Lord Colchester, was surveyor to a large number of persons, and several architects were instructed by him. He had two sons, one or other of whom was employed conjointly with himself in most of his larger works of architecture, and he was assisted generally in all his professional pursuits by both. He died March 16, 1843, aged about seventy-two. Henry William Inwood, the eldest son of William Inwood, was born May 22, 1794. He was several years in Greece, and examined with great care the architectural remains at Athens and elsewhere, and made plans and drawings of them. He assisted his father in most of his architectural pursuits, especially in designing and constructing St. Pancras Church, and had he not suffered so much as he did for many years from ill health, would probably have attained to great eminence as an architect. His death is supposed to have occurred March 20, 1843, about which time a ship in which he had sailed for Spain was wrecked and all on board perished. Charles Frederic Inwood, second son of William Inwood, born November 28, 1798, besides assisting his father in his works, was the architect of the church of All Saints at Great Marlow, in Buckinghamshire, which was completed in 1835. He died in May 1840, aged forty-two.

St. Francesco, Rimini.

The church of St. Francesco at Rimini is one of the earliest and most satisfactory examples of the restoration of the Classical style. It was erected by Sigismund, the most distinguished of the Malatestas, who had ruled over Rimini for a long series of years. In his declining age Sigismund formed the plan of erecting a church, which should be the mausoleum not only of his own family, but of those who had been his companions—the poets, the philosophers and the artists who had enjoyed his patronage—that those who had been his companions during life might be united to him in their sepulture. For this purpose Sigismund commenced the church, and the architect whom he employed adopted the Gothic style. When the building, however, was far advanced, it would seem that some of the artists or literati patronised by Sigismund recommended the adoption of the Classical style, then arising in Florence under the great master Brunelleschi. With this intent Sigismund sent for Leon Battista Alberti, the Raphael of Italian architecture, who, when he surveyed the building, found that he had a task of no ordinary difficulty to accomplish. He recommended that the interior of the building should continue unaltered, but that the exterior should be completed in what may be termed a Classical style. This he accomplished with extraordinary power, exhibiting, perhaps, a more complete appreciation of Classical antiquity than even Brunelleschi himself.

Doorways.

In Classic temples there was only a single lofty doorway within a portico forming the façade, a circumstance not attended to by every one, because generally overlooked by those who give us classical porticos far more scrupulously literal than need be in regard to columniation, yet having internally comparatively small doors, if not windows also. In the antique style the dressings of doorways are very simple compositions, however elaborately their details may be enriched; in nearly all cases alike, the architrave mouldings forming the jamb of the door bear a standard fixed proportion to the width of the aperture or door itself, which last generally fills up the entire opening, except where what answers to a modern fanlight is left between the door and the lintel of the doorway, as in the Temple of Vesta at Tivoli, that of Hercules at Cora and the Pantheon at Rome, in all which that space was filled in with open or lattice-work in metal, for the admission of air and light, whereby a door and window over it were united into one composition. The two last-mentioned examples are further remarkable, as instancing the mode resorted to for enlarging the doorway to the proportions

required by the rest of the design without increasing the aperture in the same degree, namely, by filling up the space between the architrave dressings and the door by antæ or pilasters. In Gothic architecture similar contraction of the aperture of doorways was practised, or, as it may more properly be termed in that style, any requisite degree of extension could be given to the general framing of a doorway by merely increasing the depth of the splay within which the door was placed, and the number of the shafts or other mouldings enclosing the opening; by this means, what would else have been a comparatively insignificant feature was rendered an important and highly ornamental one. Even in the most magnificent portals and in the façades of the largest structures in the Gothic or Pointed style, the doors themselves are usually of moderate size, and the aperture is besides frequently divided into two by a central pillar or shaft; whereas very spacious and lofty doors would have been attended with the inconvenience of exposing the interior too much whenever they were opened. Little judgment, therefore, and not much more knowledge of the style itself was shown in making the entrance doors of Fonthill Abbey of the preposterous height of 30 feet, dimensions that would have been lofty to excess even for a gateway, except such a one as the beautiful Erpingham Gate at Norwich.

Wood in Brickwork.

It is generally held that nothing but its own components should be admitted into a brick wall, except what is absolutely necessary for its connection with the other parts of a building, such as wall-plates and wood bricks (and that these should be avoided as much as possible), templates, lintels, &c. Wall-plates are required to receive the ends of the joists, and distribute the weight of the floor to which they belong equally along the walls. If the joists tailed singly on the naked bricks, their thin edges would crush those immediately under them, and the rest of the brickwork would escape immediate pressure altogether. Wall-plates may be superseded by the use of templates; but this involves the necessity of framed floors, which are carried by a few large beams, under whose ends stout pieces of timber 3 or 4 feet in length are placed. These are intended, like a wall-plate, to distribute the weight over a considerable part of the wall, and prevent the necessity of placing the beam on the naked friable bricks, and are called templates. Lintels are used over square-headed windows and doors instead of arches in brickwork. They are useful to preserve the square form and receive the joiner's fittings, but they should always have discharging arches over them, and should not tail into the wall at either end more than a few inches, that the discharging arch be not wider than is absolutely necessary. If, however, discharging arches be not turned over them, the lintels should tail in at each end considerably, and have small templates or wood bricks placed transversely under them. They may generally be quadrants of a circle, or even flatter, and should be turned in two or more half bricks over doors and windows, and other wide openings, but over the ends of beams they need not be in more than one half brick.

Salisbury Cathedral.

The uniformity of style in the interior of Salisbury Cathedral, it is admitted, adds greatly to the fine effect of the exterior appearance, yet it has been remarked that the interior of this church is neither so grand, picturesque nor diversified as that of many other cathedrals. Time, by its slow and irresistible progress, has imparted to the edifice that sombre hue of antiquity which makes the old age of buildings the period of their greatest beauty. Revolutions, political and religious, have stripped the church of its sculpture and paintings; but fashion has within these walls done more mischief than revolution, and in the assumed names of taste and improvement has destroyed part of the original plan, and by a capricious change in the sites of its ancient monuments has despoiled the cathedral of some of its greatest ornaments. One of the principal alterations made under the direction of Bishop Barrington in 1789, by James Wyatt, was the opening of the lady chapel to the choir by the removal of the ancient altar and its screen, taking it for granted that the professors of architecture in the reign of Henry III. must have had false ideas of proportion, the lady chapel being then universally kept distinct from the choir. This supposed improvement could not, however, be completed without also removing two chapels, one on the northern side, erected by Bishop Beauchamp, and one on the southern side by Lady Hungerford, both built in the fifteenth century. It was at the same time necessary to alter the level of the pavement, when several stone coffins, with perfect skeletons, were disinterred, supposed to belong to the early benefactors of the church. Many of the ancient monuments were removed, and were ranged between the clustered pillars in the nave; two porches were taken down and the openings closed up. There is but one opinion respecting the desecration which was then called improvement.

NOTES AND COMMENTS.

ALTHOUGH the Marquis of BUTE has, since he attained his majority, given commissions to a larger number of architects than most peers, happily only one instance has occurred in which the aid of the law courts was invoked respecting fees. The exception came before the court of session in Edinburgh, and strictly speaking his lordship could not be considered as a defendant. The plaintiff was the representative of the late JOHN RUSSELL WALKER, an Edinburgh architect, who died in July 1891. In 1890, the Marquis of BUTE asked Mr. WALKER to prepare a design for a large Roman Catholic church to be built in Dunfermline. The plans were prepared and were approved by the Archbishop of Edinburgh, and by the priest at Dunfermline. The Marquis of BUTE, however, explained to Mr. WALKER that the selection of the plans did not lie with him, and that his object in having a sketch plan prepared was to assist him in laying his ideas before the church authorities. His lordship did not deny liability for the work, but said that it was only after the raising of the action that the plans were produced, and he was therefore unable to make any offer for the work done. The action was not allowed to proceed as a liberal sum was given in settlement.

IN the windows of the chancel in the cathedral of St. Stephen, Vienna, a large number of fragments of stained-glass can be seen. They are derived from other windows, and form as curious a medley as exists in the world. At a distance the effect might be considered kaleidoscopic, only there is no such symmetry as the toy displays. When examined closely, the windows present a sort of topsy-turveydom such as some lunatic glass painter might see in his dreams. For a long time past it has been felt that the fragments are out of place near the high altar of so noble a church, and resolutions about their removal were made by the cathedral authorities and approved by the Government. Orders were given long ago for painted glass to fill the windows, and the erection of it could be commenced immediately. But what is to become of the ancient fragments? There are many amateurs who would compete for the possession of the smallest piece, for the colours have become beautiful. As the glass is considered national property, that sort of disposal would not be satisfactory to the Austrians. To set up the collection of pieces in one of the museums of the city would be to repeat the impropriety which has given offence in the cathedral, and the various curators appear to have opposed the proposition. It is likely therefore that the glass will find a refuge in some provincial museum.

THE annual meeting of the Province of Quebec Association of Architects has been held at Montreal, when the following officers were elected:—President, J. BAILLARGE, Quebec; first vice-president, A. C. HUTCHESON; second vice-president, A. T. TAYLOR, Montreal; secretary, JOSEPH VENNE, Montreal; treasurer, JOSEPH PERRAULT, Montreal; auditors, W. MCLEA WALBANK and J. Z. RESTHER; council, A. F. DUNLOP, Montreal; F. X. BERLINGUET, Quebec; JAMES NELSON, Montreal; A. RAZA, Montreal; J. E. Z. GAUTHIER, Montreal; O. B. BERTRAND, Montreal. A framed photograph of the forty-two Montreal members was presented to each of the members from Quebec, in return for a similar courtesy. Afterwards there was a conversation in the rooms of the Art Association, in which about one hundred and thirty architectural drawings were exhibited.

THE London County Council having had under consideration the provision that should be made for washing and drying the tenants' clothes on the Boundary Street area, Bethnal Green, have approved of the plan of a central laundry, to which will be added four baths for women and twelve for men; the charge to be, for a cold bath one penny, and for a hot bath twopence. The public health and housing committee, in recommending this plan, considered it to be superior to the practice commonly adopted in "artisans' dwellings" of providing wash-houses, either on each floor of the tenements, or on the roof, a practice which often involves the unhealthy and incon-

venient necessity of clothes-drying in the tenants' rooms. The Council's architect has submitted a plan which provides forty-two washing stalls, with all necessary accommodation, and appliances for wringing, drying, mangling, ironing, &c. The estimated cost on capital expenditure is 7,250*l.*, the annual charge in respect thereof, including sinking fund, being about 234*l.* The estimated outgoings in maintenance, &c., are 1,313*l.*, total, 1,547*l.*; the estimated receipts being 1,154*l.* An estimated annual deficit of some 393*l.* is anticipated—a sum equal to $\frac{3}{4}$ *d.* per week per room in the buildings. It is calculated, however, that by abandoning the laundries in the buildings an annual saving equivalent to 1*l.* 4*d.* per week per room will be effected, viz. 700*l.*, the interest on 13,125*l.*, the estimated capital outlay.

THE Paris Chambre Correctionnelle and M. BIDAULT DE L'ISLE have made short work of the charge brought against M. ALFRED STEVENS, the Belgian painter, by a picture dealer. M. STEVENS, like many painters, accepted some advances on account of his works. Dealers are generally over-anxious to press money on artists, because they hope in that way to secure pictures which might be carried off by rivals. In this case the dealer obtained a lien on the pictures in such a form that the painter was supposed to be "the man in charge." Afterwards the dealer wished to have another custodian, but M. STEVENS stated that, acting on his rights, he had disposed of the works. The dealer therefore issued his summons for breach of confidence. The tribunal declared that the process was unnecessary as there was no breach, since the accounts between the parties were never properly made out. The counter-claim by the painter for damages arising out of such a charge was afterwards heard, and the dealer was fined 500 francs, which, we suppose, was as much as the tribunal could impose.

A MEMORIAL of JACQUES-FELIX DUBAN, the architect, has been set up in the vestibule of the theatre which contains DELAROCHE'S painting of the great artists of Europe in the Ecole des Beaux-Arts, Paris. It consists of a pedestal of white marble, designed by M. BERNIER, and a bronze bust, sculptured by M. EUGÈNE GUILLAUME. There is especial appropriateness in having a memorial of DUBAN in the school, for he was associated with the buildings during his whole career as an architect. Soon after his return from Italy, in which he studied as a winner of the Prix de Rome, he was appointed about 1830 as inspector on the works of the school. From 1832 he was the architect. It was under his direction the covered court, the theatre, the library, &c., were constructed. In 1858 he began the works on the part facing the Quai, including the Salle Melpomène. To his ability the school owes the remarkable attractiveness of its numerous buildings, and it was fitting that future generations of students should be able to realise the appearance of an artist who was so thoughtful about their Alma Mater.

THERE is a remarkable difference in the zeal for church building and restoration between the two archdeacons of the diocese of Chichester. It was found from returns from the churchwardens presented on Wednesday, that in the Chichester archdeaconry during 1892, 854*l.* 6*s.* was expended on the building or restoration of churches, mission chapels, parsonages, churchyards and endowments; and that in 1893 the sum so spent was 5,952*l.* 9*s.* The returns furnished by the clergy, however, made out that the sum raised for the above purposes in 1892 was 7,790*l.*, and in 1893, 3,717*l.* During fourteen years the expenditure was 128,378*l.* In the archdeaconry of Lewes the sums expended in 1892 were as follows:—Restoring churches, 18,583*l.* 12*s.* 2*d.*; mission rooms, 1,736*l.* 8*s.* 10*d.*; churchyards, 452*l.* 9*s.* 11*d.*; parsonages, 1,608*l.* 2*s.* 11*d.*; endowments, 2,551*l.* 1*s.* 6*d.*; total, 24,931*l.* 15*s.* 4*d.* In 1893 the following sums were expended:—Restoring churches, 21,213*l.* 0*s.* 7*d.*; new chapels of ease, 7,234*l.*; mission-rooms, 1,563*l.* 3*s.* 5*d.*; churchyards, 673*l.* 10*s.*; parsonages, 6,516*l.* 4*s.* 7*d.*; endowments, 1,939*l.* 14*s.* 10*d.*; total, 39,139*l.* 13*s.* 5*d.* The fourteen years' expenditure in this archdeaconry amounted to 670,306*l.* The Lewes division is probably the wealthiest, but the contrast with Chichester is, none the less, most remarkable.

The Architect, Oct. 26th 1894.

QUEEN'S HALL, LANGHAM PLACE.—DOORWAY.

PRESBYTERIAN CHURCH OF ENGLAND, BROMLEY, KENT.

THESE buildings now in course of erection on the east side of Freeland Road, near the junction of Upper Park Road, occupy a site 150 feet deep by 70 feet frontage, and when finished will form one of the most convenient and complete blocks of buildings recently erected for the Presbyterian Church of England. The buildings include a church, lecture-hall, vestry, classrooms, &c., and have been admirably planned and arranged to meet the varied requirements of church work. The plan of the church is cruciform and consists of nave, aisles and transepts, with seating for over 700 worshippers—547 in the area and 174 in the galleries, which are in the transepts and at the west end of nave. The choir and organ are in the north transept gallery. Immediately in rear of the church is a lecture-hall, to hold about 240, and so arranged that it may easily be divided by folding partitions into separate classrooms for Sunday-school purposes. There are also on the ground floor a session house, vestry and lavatories, and on the first floor a large classroom and a ladies' or "Dorcas" room with lavatory attached. In the basement are a kitchen and heating-chamber. The whole of the exterior walls and the interior of the church are faced with red brick with Douling stone dressings. The roof has steel principals and purlins and is covered with green slates, and the woodwork of the interior is of pitch pine. Solid wood-block flooring throughout the ground floor for church, hall and passages. The spire measures 118 feet from ground to vane. Mr. JOHN C. T. MURRAY, of 13 Queen Anne's Gate, Westminster, is the architect, and the work is being carried out by Mr. JOHN BENTLEY, contractor, Waltham Abbey, Mr. GEORGE BARBER acting as clerk of works. The system of heating is by Messrs. MUSGRAVE & Co., of London and Belfast.

THIS illustration is reproduced from the drawing by Mr. SCORER, which was exhibited this year at the Royal Academy.

HOUSE AT BLACKHEATH.

THE ACADEMY AT ATHENS.*

THERE are few modern structures which possess greater interest for the student of Classic architecture than the academy at Athens, for it is a building constructed of marble from the same quarries as the Parthenon, and enriched with decorations in polychrome carefully studied from the examples of the best period, which lay close at hand. It is from this building, therefore, if from any standing at the present time, that we must judge of the effect of the Greek temple in its perfection, with its white surfaces and brilliant decorations in red, blue and gold. For no one can doubt, in view of the recent discoveries, that the Greeks used colour with a lavish hand on both sculpture and architecture.

The academy and university with the library, which is under construction at the present time, form a group of the finest buildings in the modern city, and occupy a block bounded on the front by the university and on the rear by the academy boulevards, two of the most important thoroughfares. The university occupies the centre, standing on the axis of a street at right angles to the boulevard, but except so far as position is concerned, the academy is much the finest building. It stands well back and slightly above the road. The approach from either side is by a broad driveway from the front by a flight of marble steps flanked by statues of Plato and Socrates by Drosos, a Greek sculptor, who executed all the important sculpture of the building. The structure was intended for the home of a body of scholars modelled after the celebrated Institut de France. But as yet the organisation has not materialised, and the modern Greeks thus possess an academy building but no academicians. The academy is one of the many buildings in Athens and elsewhere throughout the king-

dom, among them the museum at Olympia, the cost of which has been defrayed by private individuals, and presented to the Government. It was erected at the expense of the late Baron Sina, a wealthy Greek of Vienna, from the designs by Hansen, a leading architect of the same place, who built in his own city the parliament house, the fine Greek church, and many other important buildings.

The work in Athens was constructed under the immediate direction of Mr. E. Ziller, who received his training as a student in Hansen's office, but has since practised in Athens, and deserves the credit of having been the architect of a large part of the most successful work in the modern city. The exterior of the academy above the basement, which is of yellow limestone, is built of Pentelic marble. The stone, however, has not been selected with the care which was used by the ancients to have it entirely free from veining, for many of the blocks are plainly marked in this way. Probably this would not be noticeable or objectionable were it not for the fact that many of the stones are not laid on the natural bed, which gives the wall surfaces and pilasters a very unrestful appearance. It is hard to understand the reason for this defective construction, for such it surely is, unless there is difficulty in quarrying the stones in the proper way, which is probably the explanation, for we know a large number of the blocks intended for the Parthenon were rejected at various stages of the work; some of them may still be seen at the quarries on Pentelicus, and others in various stages of completion on the Acropolis. There is but one other serious criticism to be made regarding the exterior of the building, namely, that the two isolated columns on either side of the main portico, crowned with the statues of Athena and Apollo, are out of scale with their surroundings. This seems to be a case of misplacing rather than of misconception, for the idea of having these deities prominent in this connection is decidedly happy.

It has been suggested that if the columns were moved forward on a line with the statues flanking the stairway, the effect would be much better.

The pediment groups, except being perhaps a trifle small in scale, are admirable. The one over the main entrance, representing the birth of Athena, is executed in marble, the others are of terra-cotta and coloured. The background of the figures in each case is a strong blue. The detail everywhere has evidently been studied with unusual care, and the carving shows a refinement, delicacy and crispness, all of which are so often lacking in modern work. The beauty of the detail can be well seen in the lamp posts which stand in front of the building, as well as the four candelabra of the main hall inside.

The polychrome decorations of the exterior are doubtless the most interesting feature of the building, red, blue and a generous amount of gold having been used with most successful results. The different members of the entablature are enriched with running patterns, and the capitals and bases of the columns are decorated in gold and colour. The wall surfaces and shafts of columns are left plain except for a rich band of decoration on a background of gold which runs around the building, corresponding in width to the height of the pilaster caps, which are themselves highly coloured, the sunken surfaces being red, while the ornament in relief is picked out in gold. The colour on the exterior has now become somewhat weathered, and the marble has begun to take the delicate yellow tone so pleasing in older work. This result has doubtless been hastened by the washing of the pigments on to the plain stone surfaces; but whatever the cause the whole effect is certainly charming, and leaves one to realise the infinite possibilities in the art of polychromy as applied to out-of-door architecture—a field upon which but a few in our day have dared to venture.

The plan of the building is extremely simple, and is clearly expressed by the external lines. Passing under the columned portico, one enters a square entrance-hall with a flat coffered ceiling and walls of plaster painted to imitate marble—the only sham in the building, but unfortunately in a most conspicuous place. On either side is a corridor leading to the wings, which consist of one large room divided by columns into three sections. In one of these rooms is now kept the valuable collection of coins owned by the Government; the other is not at present open to the public. Directly back of the entrance-hall is the large hall intended to be used for the sittings of the members of the academy. The room is finished in white marble, richly decorated in red, blue and gold. The frescoes, which are much above the usual standard of such work, are series of paintings relating to the myth of Prometheus. The marble statue of Baron Sina, which stands at the end of the hall, is by Drosos. The ceiling, while perhaps not as successful as the remainder of the hall, has the merit at least of showing honest construction, for the lines follow strictly those of the roof.

It was my good fortune during my last visit to Athens to be able to examine closely the cornice and pediment of the Parthenon from a staging erected for a professor of the Ecole des Beaux-Arts. The patterns of the main lines of decoration are

* A description by Mr. Thomas A. Fox, contributed to the *Architectural Review*.

still quite plainly marked in places, and a few traces of colour are still to be seen, although much less apparent than at the time of Mr. Penrose's examination some years ago. Near the top of an internal angle of one of the triglyphs I was able to uncover with the point of a knife a bit of the original blue, almost as bright as pure cobalt. This careful examination of the old work confirmed my opinion that the polychrome decoration of the academy was executed only after careful study, and is so far as possible a correct reproduction of the patterns and colours used on the temples of the best period of Greek art and architecture.

"TARA'S HALLS."

THERE can be little doubt that, owing to the absence of any systematic study of archæology in Ireland during many centuries, the people have been induced by the exaggerations of minstrels and others to imagine that the country was full of palaces. Tara's Halls were easily pictured as a romance in limestone. Some fifty years ago, when fancy was supplanting good sense, George Petrie endeavoured to explain to his countrymen that the only remains of halls on the famous hill were mud banks. The royal festivals which were supposed to surpass all that were enjoyed in other lands were no more than assemblies in the open air. Petrie's investigations were, however, ignored except by a few scholars. It is remarkable that during the period which has elapsed since the publication of his essay on the "History and Antiquities of Tara Hill" nothing has been discovered which would weaken his conclusions. In the *Journal of the Royal Society of Antiquaries* for the present quarter the essay has been employed by the Rev. D. Murphy, S.J., and Mr. T. J. Westropp, M.A., as a guide to the compilation of a description of the earthworks, and they describe it as "a work worthy of the highest praise for patient research and exhaustive treatment," to which they refer students who desire more details. Petrie's essay is only to be obtained in the *Transactions of the Royal Irish Academy*, for his countrymen were no more disposed to patronise a publication of it than of the other writings of the most cautious and careful of modern archæologists. Accordingly it may be useful to give some extracts from the "Notes" in the *Journal* which have been derived from the essay:—

Tara became the chief residence of the Ardrigh, or chief king of Ireland, in the time of Slainge, the first of the Firbolg kings, A.M. 3266, according to the chronology of the Four Masters, and continued to be so until it was abandoned by them A.D. 563. Within that period of 2,530 years there reigned here 142 kings.

Cormac Mac Airt was Ardrigh from A.D. 227 to 266. This monarch's reign is the epoch at which most of the monuments now remaining at Tara were erected. The Four Masters tell us:—"It was Cormac who composed the Teagasc na Riogh, i.e. instruction of the kings, to preserve manners, morals and government in the kingdom. He was an illustrious author in laws, synchronisms and history; for it was he that promulgated law, rule and regulation for each science, and for each covenant according to justice, so that it is his laws that restrained all who adhered to them to the present time. It is this Cormac also that assembled all the chroniclers of Ireland together at Temur, and ordered them to write the chronicles of Ireland in one book. In that book were the coeval exploits and synchronisms of the kings of Ireland with the kings and emperors of the world, and of the kings of the provinces with the monarchs of Ireland."

The last pagan monarch who resided at Tara was Dathi, who, as we learn from the "Leabhar na hUidhri," was killed by lightning at "Sliabh Ealpa," A.D. 428. His body was brought home and buried at Rathcroghan. His successor was Laeghaire, son of Niall of the Nine Hostages, whose reign lasted for thirty years. He was captured by the Leinster men in the battle of Athdara, and "he gave the guarantees of the sun, of the wind, and of the elements, that he would never come against them on their letting him from them. He died the next year at the side of Caisse between Ere and Alba, two hills in Hy Faolain." In the fourth year of his reign St. Patrick came to Ireland. His journey along the Boyne, the lighting of the Easter-fire at Slane, and the lorica or hymn of protection, which he composed on the way to Tara, his appearance before the king, and the king's conversion, are they are not written in the many "Lives" of Ireland's patron saint?

Diarmuid Mac Fergus Ceirbheoil, great grandson of Niall, was Ardrigh from 539 to 558. It was in his reign that the last *feis* was held in Tara. He was the last monarch who had his residence at Tara, as it was abandoned soon after his death in consequence of the curse of St. Ruadhan of Lorrha.

Though it was never after used as a royal residence, the Ardrighs, however, continued to take their title from it till the coming of the Anglo-Normans. In Amergin's time it was apparently a mere range of earthworks, as it is at present, and even then some of its embankments had been demolished.

We will now pass on to the topography of Tara, giving a short account of the history and legend of each monument. Beginning at the extreme north-west corner of the hill, in a thick plantation, we find a group of three forts and a well. The latter still retained to modern times its name of "Tober finn," i.e. the clear well. Near it are two forts side by side.

1. *Rath Grainne*.—This, tradition says, takes its name from Grainne, daughter of King Cormac, whose flight with Diarmuid O'Duinne from Tara is one of our best known legends. It consists of two concentric mounds, the outer one sweeping boldly down the steep slope, and measuring 258 feet in diameter externally; the inner, 66 feet internally.

2. *Rath Caelchon*.—So named from Caelchu, great grandson of the famous Cormac Cas, king of Munster in the third century. He was for a time a hostage at Tara, and seems to have settled in the neighbourhood, for he was ancestor of two families living in Meath before the Norman conquest. He was buried in this rath, probably in the oval mound at the north side of it. This rath measures 230 feet across, and is 5½ to 7 feet in height, and has an entrance ridge across the moat to the south-west.

3. *Fothach Rath Gruinne, the Seat of Rath Grainne*.—It is amongst the trees, south of Rath Grainne. It measures 157 feet across, and 102 feet on the inside.

4. *Teach Míodchuarta, i.e. the Hall of Assembly*.—It is also called "teach na laech," the heroes' house; "long na laech," the heroes' dwelling; "barc na mban," the women's ship. It is now represented by two parallel mounds along the slope of the hill, so placed, perhaps, to raise the king and nobles at the southern end above the crowd. It is 759 feet long, and 90 feet wide externally and 45 feet internally. It had seven doors at each side. An ancient poem says it was only 300 feet long, so it may have had three sections—a central hall of that length, and portions cut off at either end where the men and the women dwelt. Our ancient books enable us to form a vivid picture of this building in its palmy days. The long room stretched down the slope for 300 feet; along each side were double rows of seats and tables, while in the middle space stood vats of liquor, lamps and huge fires, at which were numerous attendants cooking. We actually possess a little ancient sketch of one of these standing open-mouthed, with the meat on a spit. Every person had a portion of meat according to his rank, the claims being strictly regulated. Some, at any rate, of the drinking-vessels were of gold and silver, enriched with red stones or perhaps enamel. At the southern and highest end sat the king and chiefs. Cormac Ulfada, who was Ardrigh A.D. 213, is described with his long, slightly-curved fair hair. He was clad in a white tunic, with a full collar embroidered with gold; over this a crimson cloak, with jewelled clasps and a gold torque. He bore a red buckler with silver clasps and golden figures of animals and stars. Lower down sat the other courtiers, bards, doctors, historians, "druids or augurs," down to the rabble of 150 cooks, waiters, jugglers, jesters and door-keepers. There was, doubtless, abundance of barbaric splendour in personal adornment, lavish if rude hospitality, noisy mirth and the more intellectual pleasures of music, song, recitations and chess.

5. *Dall and Dorcha*.—These were two small mounds south-west of the hall; but which is which no one can now determine.

6. *Pupail Adamnain, i.e. Adamnan's Tent*.—This rath is faintly discernible in the graveyard which, with Tara Church, occupies its site. Adamnan's cross still remains: a panelled shaft of red sandstone, 6 feet high and 1 foot 6 inches broad. On it appears a rude figure resembling those called Sheela-nagigs. Two curious old stones, 2 feet 6 inches high, attributed to the "giants of Tara," are, with another now lost, the monuments of the Druids Mall (to the east), Bloc (to the south), and Bluicni (to the north). Tradition says they were erected by Mall, king of Emania, A.D. 130; and Mac Firbis tells a marvellous story of the stones of Bloc and Bluicni drawing apart to let pass the chariot of a true candidate to the crown of Tara, while the other sacred stone, Lia Fail, thundered in honour of his coming. The modern church possesses a very fine ancient window removed from the older one. Near this building, on clearing away a bank in 1810, were found two noble gold torques, one being 5 feet 7 inches long, with four perfect spiral bands, now to be seen in the Royal Irish Academy collection of the National Museum, Kildare Street.

7. *Teach Mariseo, i.e. Mariseo's Houses*.—This was a fort to the south of the church, and near a mound called the Sidh. From it spread the houses of the town of Tara down the eastern slope of the hill. Mariseo was a lady of great beauty who lived in the time of King Cormac.

8. *Rath na Riogh, i.e. the Kings' Rath*; called also Cathair Crofinn, i.e. the enclosure of the white house.—This is the most important of the monuments of Tara, and, traditionally, the oldest monument on the hill. It is a huge irregular oval, 853 feet north-west and south-east, consisting of a ditch 4 feet deep and a rampart 6 feet high. Within its enclosure are two forts and two mounds, viz.:—

9. *Teach Cormaic, i.e. Cormac's House*, a rath with an outer ring, said to have been constructed by King Cormac; and

10. *Forradh, i.e. the Place of Meeting*.—An earthwork, like the last, but being in the centre of the great enclosure, it is perhaps older. It is 88 feet across inside, 132 feet externally, 216 feet over all east and west, and 296 feet north and south. At the central point of juncture of its outer fosse with that of Teach Cormaic, Tea is said to have been buried. It is at present crowned with the Lia Fail.

11. *Lia Fail, i.e. the Stone of Destiny*.—This is a pillar of granular limestone, not of the kind usually occurring in the neighbourhood. It was removed from the Mound of Hostages, and put over the "Croppies' grave," some of the insurgents of '98 having been buried in the Forradh. It is 5 feet 3 inches high, and is said to be 6 feet under ground.

This stone was brought to Ireland by the Tuatha de Danaan, the fourth colony, which came to Ireland A.M. 3303, according to the "Annals of the Four Masters;" other authors say by the Milesians. It was called the Lia Fail, according to Keating, because a very ancient prophecy foretold that in whatever country this stone was preserved a prince of the family of Milesius should rule. Ossian, in a colloquy with Dermot, describes the qualities of the Lia Fail. "Any one of all Ireland on whom an *ex parte* statement rested was set upon that stone, and if the truth were in him he would turn pink and white; but if otherwise, a black spot would appear in some conspicuous place on him. Moreover, when Ireland's monarch stepped on to it, the stone would cry out under him, and her three arch-waves boom in answer, as the wave of Cleena, the wave of Ballintoy and the wave of Lough Rury. When a provincial king went on it, the flag would rumble under him." According to Petrie, the stone now standing on Tara is the identical Lia Fail. This, however, is denied by Keating and others.* They say that when Fergus, the son of Erc, passed over into Scotland with a colony of the Dalriada and settled there A.D. 570, he wished to be crowned on this stone. He sent messengers to his brother Murrough, then king of Ireland, asking that the stone should be sent to him, to make his coronation the more solemn. It was preserved with great veneration in the abbey at Scone, till Edward I. of England carried it away by violence, and placed it under the coronation chair in Westminster Abbey, where it now is. Whatever be the fact, Petrie's assertion that no Irish authority earlier than Keating can be produced in favour of this belief is not quite correct; for in the Agallamh na Senorach, *i.e.* the Colloquy of the Ancients, after Ossian had described the qualities of the Lia Fail, as above, Dermot Mac Ceirbheoil asks him, "And who was it that lifted that flag, or that carried it away out of Ireland?" Ossian replies, "It was a youth (oglaech) of a great spirit that ruled over..." Unfortunately the rest of this piece is lost.

12. *Dumha na Bo, i.e. the Cow's Mound*; called also Glas Temhrach, from Glas, the famous mythic cow of the Tuatha de Danaan smith Gaibhnion,† and

13. *Dumha na Ngiall, i.e. the Mound of the Hostages*, traditionally the basement of the house given by King Cormac to the hostages brought to him from all Ireland, are two small mounds north of the forts within the enclosure of Rath na Riogh, the latter being some 13 feet high. The hollow from which the pillar was removed is apparent on its summit.

14. *Rath Laoghaire, i.e. Laoghaire's Rath*.—South of Rath na Riogh, on tolerably level ground, under the first slope of the hill, will be found the western rampart and faint traces of the fosse of a large circular fort, 428 feet to 462 feet across. This was the fort of King Laoghaire, son of Niall of the Nine Hostages and contemporary of St. Patrick. We need not here tell for the thousandth time their meeting on that great Easter morning, but will only remark that Laoghaire, despite the teaching of his saintly guest, retained certain deeply-rooted traces of paganism. He swore by the wind and sun, and broke his oath, believing the oracle that he would die only "between Scotland and Erin: and between two hills called Alba and Eri he died, struck down, people said, by the outraged elements;" a victim to the prophecy "that kept the word of promise to his ear and broke it to his hope." As he had desired, in accordance with the teaching of his pagan father, the great Niall, he was buried upright in his armour looking towards his foes the Lagenians (as Tirechan says), "till the day called Erdath among the Magi, the day of the judgment of the Lord."

15. *Rath na Seanaid, i.e. Rath of the Synods*.—This was situated immediately to the north of the Lia Fail and the

Mound of Hostages; near it were the remains of Pupail Adamnain. The age of this rath is evidently anterior to the events of which it was the theatre, and from which it got the name which it now bears; its original name is forgotten. The synods held here were that of St. Patrick, that of Ruadan and Brendan, and the synod in which Adamnan had the law passed setting women free from the obligation of going into battle; the date of this last synod was probably 694. Adamnan was the well-known biographer of St. Columba. Another synod was held at Tara by the Hy Neill and the Lagenians under the presidency of Dublettir in 771.

16. *Rath Maeve*.—It lies about a mile south of Tara. It is a large circular earthwork without any ditch, 673 feet in diameter. Maeve, from whom it has its name, was wife of Art Aoinfir, who was Ardrigh A.D. 186 to 216; others say it was named from Cormac's daughter.

THE DOLMENS AND MENHIRS OF CARNAC.

IN the *Scotsman* of the 10th inst. is an important description of the ancient stones at Carnac, contributed by Dr. James MacGregor, and which was written by him at the place. It accordingly suggests the impressions which are made on the mind of a visitor more clearly than many of the essays on the subject which were produced under other conditions. The doctor writes:—

Menhir is a Breton word, meaning "tall stone." From the mouth of the Breton peasant it has passed into the language of science as an accurate description of very remarkable monuments known to him and to his fathers, and now known to the whole world as the menhirs, or standing stones of Carnac, from which, at the nearest point, they are distant exactly half a mile. Carnac means the place of the cairn, the Breton cairn being pronounced exactly in the same way as our Celtic word cairn, which may probably mean, as the Breton word does, the place of bones. The vast cairn or mound to which the quaint little town or village owes its name is fifteen minutes to the north-east, and is by far the most conspicuous feature in the surrounding landscape. It is the Mont St. Michel, a high, natural mound, topped by a vast, oblong stone tumulus 88 yards in length and 66 feet high—large enough to allow of a little chapel on its summit, and ample room to spare. Beside it is a granite cross with the scene of the Crucifixion and its figures carved upon it, and hence known as a Calvary. In 1862 the indefatigable Société Polymathique of the Morbihan discovered a large dolmen within it. Our countryman, James Miln, whose memory is here so profoundly and justly revered, in 1875 discovered within it what is more interesting to us, traces of an ancient structure built by the Britons who emigrated in large numbers here after the Saxon invasion. It is understood that extensive excavations are to be made in it next year by the Government.

Our first visit on arriving at Carnac was to Mont St. Michel. There at our feet are the long lines of Carnac, looking for all the world like a narrow cemetery, or series of cemeteries, thickly crowded with grey stones and stretching across country to the north-east, up a gently-rising ground a distance of well over three miles. The line is broken here and there by pine woods. The whole long stretch is called the lines of Carnac. These lines are not now, and never were, absolutely continuous. They are, and probably always were, in three sections, now named after the farms or groups of houses on whose ground they stand. The westernmost, nearest Carnac and the sea, and also the largest, are the lines of Menec; the next on higher ground are the lines of Kermario; the third and the highest are the lines of Kerlescan. "Ker" is a common word here, and means village. We approach them by the high road, which cuts the lines of Menec in two. What do we see? Eleven lines of menhirs or standing stones, the lines fairly straight and fairly parallel, the width of the avenue between them being from 16 to 25 feet. The stones are rough, unshapely, utterly irregular in height and form, steadily increasing in size towards the west from 3 feet to 11 feet in height. One stone taken at random was 20 feet round. The distance between the stones in the same line when left in their original position averages 14 feet. They are all grey granite, weather-beaten, lichen-covered to the north, and clean on the south where the sun strikes them. Although the lines are broken and great gaps occur between the stones in the lines, the regularity is, on the whole, remarkable. The ground inside them here and there bears marks of recent cultivation, and is covered with a low scrub of heather, whins and grass, which is regularly cut by the peasants and kept well down, so that one can walk with comfort all over the ground. At the western end there are ample remains of the cromlech which ended the Menec lines. It formed a complete semicircle, something in the shape of a well-bent bow, the string cutting the lines at right angles and the bow towards the sea. The stones, of which many remain, are of a smaller size than those on the lines and are joined close together. There is every reason to

* In poems by Kineth O'Hartigan and by Cuan O'Lochain, in the tenth century, as well as in the account of Amergin, the Lia Fail is stated, on their own knowledge, to be then at Tara. Kineth says it was "under his two heels" as he composed. This, and the fact that the Westminster stone is held to be of Scotch origin by competent geologists, bears heavily against the tradition of Fergus.

† It has been demolished since 1840.

believe that the cromlech was a place of worship—the temple, to which the lines were the avenues. There are 1,035 standing stones in Menec and 187 in Little Menec close by. A pine-wood divides Menec from the higher ground of Kermario. Here again there is a large farm steading and a dolmen. At the west end of Menec you look out on the sea. At the west end of Kermario you reach the summit of the rising ground, and but for the pine-wood would look down upon Menec and the sea together. There was a purpose in the stones ending just there. The lines at Kermario are ten in number, and rather further apart than at Menec, and the stones, of which 773 are standing, all over, and especially to the west, much larger, much closer together than at Menec. There are more of them in a given area. I have seen Stonehenge, and the stones of Kermario seem to be much of the same size. I have been at pains to measure them, as I could get no authentic information anywhere, and found that the first four stones in the fourth line averaged 11 feet 2 inches in height and 23½ feet in girth. Another stone was 13 feet 4 inches in height and 22 feet 2 inches in girth. Carefully measured, the average distance between the stones in line varied from 12 to 16½ feet, and the breadth of the avenues or distance between the lines from 21 to 36 feet. Like those of Menec they decrease in size towards the east.

Here, as at Menec, there is evidence of a cromlech having existed at the seaward end. The ground slopes gently down and then rises rapidly towards the east. At the highest point there is an old strongly-built tower now in ruins. Let us sit here in the sunshine for a little. You have nearly a mile of the monuments within your eye. As you sit and ponder the inexplicable mystery of the whole thing amazes you. What can they mean these long lines of stones, looking like long winding columns of an army, with sad gaps among them, marching up the one slope in a waving line and in a straight line down the other? There to the east you lose sight of the columns in the hollow, where you see only the tops of the trees, but your eye catches them on the rising ground beyond, rather thinned in numbers, but steadily, century after century, plodding on. Here and there you see menhirs taller than the others, looking like the officers in command. On both sides of the slope substantial farmhouses are found within the lines, built of the stones which have been cleared away. On a rising ground to the north rises like an obelisk the princeliest menhir of them all, close by the quadrilateral cromlech of Manio, which, with its sixteen small menhirs joined close together, it seems to guard. It is nearly 20 feet high and 17 feet in girth, and is, I believe, the largest standing stone in Brittany. Standing above the lines, it suggests the idea of the commander-in-chief of the great army below surrounded by his staff. Another pine-wood has to be crossed, and then the lines of Kerlescan with a very pretty country stretching round. Again, the stones, of which 251 are standing, are much larger than those at Menec, and fairly complete at the west end. Some of them are enormous. Here is one block, looking like a natural rock *in situ*, 13 feet high and 28½ feet in girth. Here again at the west the lines are cut at right angles by another line, forming a cromlech. Eighteen of the stones are still standing—five of them close together, as they all were when complete, their faces looking westward to the sea.

I fear I have bored with too many figures such as may read these words. My excuse is this, that it is no more possible to convey any adequate impression of dimension by saying that a stone is large or enormous than by saying it is the size of a piece of chalk. Although I have had, somewhat late, access to the writings of James Miln and others, and all along had access to the rich museum he has left behind, of which the intelligent guardian was Miln's faithful attendant in all his explorations, beyond the height of one stone at Menec and several at Kermario, I have been unable to get any information whatever as to the size or weight of a single menhir at Carnac. The following figures, given me at the museum, even though they differ from guide-books, may be thoroughly relied on. Within a space 3 miles 23 yards long, and, roughly, 120 yards broad, there are standing to-day 2,262 menhirs; 156 are lying among the lines, 272 are lying in walls, 200 are broken in fragments, making 2,890 in all. To these must be added 610 more in the adjoining country. At Erdesen, a few miles away, standing, fallen and broken, there are 1,200, and at St Barbe 30, giving for the district 4,730. Of dolmens there are 55 at Carnac, 256 in the Morbihan and in Brittany nearly 500. These are only the poor remains which the ravages of time have left. There is reason for believing that on the ground to which we have alluded there have stood as many as from 12,000 to 15,000 menhirs. I have heard it said, by one who knew what he was talking about, that as many as 15,000 menhirs were gathered in Brittany, and employed in building the Fort of Quiberon. Successive generations of men have made them convenient quarries. You cannot walk to-day along the admirable roads with which the country is covered, and in among the pleasant lanes, without seeing them everywhere in the dykes. Villages have been built out of them. Not only the parish church on which I look as I write, with its

much-admired and hideous baldachino porch, but I am informed on good authority this whole town of Carnac was built out of them. As late as 1626 they numbered as many as 6,000. While so much is irrevocably gone, let us be thankful that so much remains, and, humanly speaking, will remain for ever. Within the last few years, mainly under pressure by Henri Martin and other illustrious Frenchmen, the Government of France, at no small cost, purchased these precious monuments. And now these great lines are all enclosed, and close by every stone or group of stones, it may be a solitary menhir on a lonely moor, there stands a massive block of white granite with the following words cut deep and large upon it, "The property of the State," and then comes the name and description of the monument, whether dolmen or menhir, &c., and then the interesting words, "The law punishes by fine and imprisonment the destroyer and mutilator of monuments."

There are various features about these menhirs which are deserving of notice. Though none of them are mere slabs, there is generally one of the sides more rounded than the other, and it is noticeable that the flatter side is turned toward the central avenue. Many of them are of a pear shape, the narrow end and the broad end being alternately inserted in the earth. They are always near the sea. They always look to the west. The lines always run in a westerly direction and look to the setting sun. The west end is marked, as we have seen, by two important features—the vast size of the stones and by the existence of cromlechs. These cromlechs are quite distinct at Menec and at Kerlescan and they are indicated at Kermario. The long avenues so laboriously constructed clearly lead somewhere, and that somewhere is the cromlech and the sea. Another thing, the dolmens and menhirs here in Morbihan are always found together. They are the work of the same men, memorials of the same time. One has only to look at them to come to some such simple but certain conclusions as these, that some great moral or spiritual force reared them, and that, like Rome, they were not built in a day. As was the case with many of the great cathedrals, we cannot go wrong in thinking that they took centuries in the building. We know what it cost, with all the appliances of modern science, to put the two great Egyptian obelisks where they now stand, on the Thames Embankment in London and in the Place de la Concorde in Paris. The menhir of Locmariaker alone was a heavier stone than either, and it was only the largest of many like it. How raised by our rude forefathers we do not know, and probably never shall.

There is one explanation as to their origin, the acceptance of which would save us a great deal of trouble. I have pointed out the remarkable resemblance they bear to columns of soldiers on the march. It is this, no doubt, that has given rise to the local tradition which has for ages satisfied, and seems to-day to satisfy, the mind of the Breton peasant. The patron saint of this parish is St. Cornély, and he is one of the most influential saints of Brittany. As the great protector of cattle, he has made this poor parish one of the richest parochial charges in the Catholic Church of France. He was martyred so long ago as the third century. The legend goes that he was one day pursued by Roman soldiers, and had to run for his life. He fled till he could flee no further. The sea was before him, and escape impossible. But St. Cornély was equal to the occasion. He turned round, bravely faced the stout legionaries, and, lifting his hand, turned them in a moment into stouter blocks of granite. One is inclined to agree with M. l'Abbé Mahé, who humorously observes, "This metamorphosis, which rivals those of Ovid, will probably not satisfy the antiquaries; but I am inclined to prefer it to their explanations, because, without being a bit more incredible, it has the advantage of being brighter and more pleasing." To this day the Breton peasant calls these stones, as his father did before him, the soldiers of St. Cornély. Driving in the country one day, we asked our coachman what menhir that was a little way from the road. His reply was, "Oh, that's nothing; that's not a soldier of St. Cornély."

But there is another resemblance which the menhirs bear, and which may lead us nearer the truth, and that is a cemetery. Ossian, though not a member of an archaeological society, was nevertheless a Celt, and a person of very respectable abilities, whose opinions, therefore, are deserving of consideration. If he never saw the Morbihan, he writes as if he did. He knew the dolmens, and he knew that they were Celtic monuments, and he knew the purpose for which they were reared. He describes them as composed of two or four or more stones. "Seest thou that stone which lifts its grey head amongst the grass? There lies the chief of the race of Diarmid. . . . O Carril, dost thou not see the tomb near to the torrent? Three stones lift their grey heads above the oak bent with the wind. Under these stones reposes a chief. Open to his soul the passage of the winds. Open to him his aerial palace. He is the brother of Cathmor. Let thy songs rise to his shade." With regard to the dolmens, Ossian was right. They were unquestionably the graves of the mighty dead. The remains found within them put that out of question. Kings and

chiefs of an ancient race were buried beneath them, not the chiefs merely of the people who hunted and fished and shot round the shores of the Morbihan—they are far too numerous for that—but the chiefs of the Celtic people, far as well as near. The sentiment that prompted the Celtic chiefs of Christian times to have their remains laid to rest in the sacred soil of Iona equally prompted the desire on the part of the great chiefs of pre-Christian times to be buried in the holy land of the Morbihan. We may be quite sure that under each of these ponderous structures there was laid the body of a man famous in his time. When one thinks of the means at their command, a galgal like that at Gavr' Innis or a tumulus like that at Kercado impresses one fully as much as the tomb of the Cid at Burgos, or that magnificent tombeau de Napoleon, with the touching inscription taken from his will, beneath the swelling dome of the Invalides. As in the case of the Pyramids, these old forefathers of our British race built for eternity. Instincts and desires that were not all of earth prompted their erection. As best they could, they expressed and embodied the hope of an imperishable home in imperishable granite. Where the hand of man has let them alone they stand pretty much as they did at the time they were reared, more than two thousand years ago, how many more no one can tell.

Looking with Ossian's eyes, we see that not merely the mighty dolmen, but the solitary menhir, like a gigantic sentinel watching the centuries, marks the place of the dead. More touching still, if we take him for our guide, we may believe that the 12,000 menhirs which stretched their long lines at Carnac either mark the spot where a soldier sleeps or is sacred to the memory of one who fell in the fight. "Rear the tomb," says Ossian, "to all those who have perished in the battle. If all were not reckoned among the chiefs, all at least were brave. No warrior is forgotten by Carril. . . . Let thy bards weep for the slain. Let the stones reared over their tombs attest their renown. In the days to come let the children of the north know the fields where their fathers fought." And finest of all:—"At the opening of the dawn his weary dreams will pass, he will see around him the tombs of a thousand warriors. He will ask, 'What stone is this?' Some old man will answer him, 'It was reared by Ossian, king of a time that is gone.'"

"Se non è vero, è ben trovato"—If it is not true, it ought to be. I like to think that beneath each grey stone in these mysterious lines a warrior once was laid. As I walk along them late of an afternoon, when the red September sun dyes the sea with blood and every tall menhir casting its long shadow on the grass, the mystic sentiment of the place steals over me, and I think I can faintly recall the feelings and the dreams of a people and a time long gone by.

There is stronger proof, however, than Ossian as to the sepulchral purposes of the menhirs. Their Celtic origin is very widely admitted, and there seems no reason whatever to doubt it. It would be a waste of time to give proof of that. The researches of others besides James Miln, who for years occupied the room in which I write these lines, have shown that they were reared before, and probably long before, Roman times. He has discovered and described among the very lines of Carnac works of defence reared by the Celts in times anterior to those of the Romans. Menhirs are found built in the walls of Roman camps. He points to one stone especially which gives proof of having been reared ages before the Romans ever visited Gaul. The local tradition about St. Cornély has probably some truth in it, as ancient traditions generally have, and may point to some destructive battle in the neighbourhood and to the graves which are of great battles the one certain result. But the most solid argument seems to be this. It is certain that in the land where these two classes of monuments principally prevail there is a close relation between the dolmen and the menhir. It is certain that throughout the whole of this region, wherever, as at St. Barbe, at Erdevon and at Carnac, there are lines of menhirs, dolmens will be found, more or less frequently, on either side; that even where a menhir stands alone a dolmen, as a rule, is not far away; that in this region, and this region alone, their orientation is precisely the same; and that, with the exceptions which I have mentioned, both alike are almost entirely free from any mark or sign whatever. Where such similarity exists it is difficult to resist the conclusion that they served a similar purpose, but the evidence for the sepulchral purpose of the dolmen is overwhelming and undisputed. It strengthens the argument to know that the same objects which have been found within the dolmens have been found at the base of the menhirs, and that the Breton names for both indicate a sepulchral purpose. Intense reverence for the dead is to-day, as it has always been, a feature of the Celtic character. In that sentiment we find a power adequate to the erection of these marvellous monuments. But that sentiment has rarely, if ever, existed alone. It is always associated with another, the faith, or the hope, or the dream of a life after death. Neither in Egypt nor in Morbihan were these costly structures reared to cover the remains of a being who was as dead as the stones that covered him. The place of graves becomes the place of worship. These mile-long alleys of

colossal menhirs were not merely lines of tombs. They were avenues that led to and ended in cromlechs, and the cromlechs of Carnac, like that of Stonehenge, were temples for the worship of an unknown God, and probably contained altars of sacrifice to the power which was adored. Of that great power the sun is the most natural and the most splendid symbol. Tradition told these ancient Bretons that through long centuries their race had been driven further and further westward, till here in Brittany, in Cornwall and in Wales they reached a barrier which, though they tried it, they could not cross. They reached the sea. On those level plains of ocean, night by night, they saw the sun go down. Where he went, somewhere far beyond their vision, their dead had gone. There they in turn would go; and so in worship they turned their faces to the sunset, and there in the Morbihan, made sacred by some great deed or some great death, forgotten even by tradition, for ages they laid their dead, where they themselves hoped to lie, close by the Little Sea that opens on the west. These, however, are mere guesses. We must leave these rude, uncouth and uncanny stones among which we have been wandering for twenty days, and whose attraction grows and deepens the longer we see them, with the admission that their origin and their meaning are a mystery; and mystery always has the compensation of charm. More than half the charm would be gone from these ghost-like lines of granite if we could tell their day and date, their why and wherefore. But there is no likelihood that we ever shall. They are voiceless as stars that shone above their builders. They are silent as the graves in which they lie.

THE HISTORY OF ARCHITECTURE.

A LECTURE has been delivered in Rhyl by Mr. J. E. Phythian on "The History of Architecture," in connection with the University Extension Course. He said they were assembled there that evening to consider together the history of architecture. There was no doubt about architecture being a noble art, but it was considered by many to be a dry subject, and when they heard people who were supposed to take a deep interest in lectures speak of the subject of architecture as such, it was evident that there was a great deal of ignorance somewhere. As a matter of fact, with the exception of music the arts had almost been ignored in our English education. While something was done in the way of painting and drawing, the history of arts, like the history of the sciences, had been neglected in England. So much so that they had really lost the use of their eyes. The ordinary Englishman went about in ignorance of the really extreme ugliness of the towns he was residing in. The object of such lectures was to induce people to take an interest in architecture as an art. While they would deal with the architecture of the different periods through which they would pass, he wished it to be understood that there would not be a superfluity of technical matter. What they had to consider was that state of architecture which related to history, which was really the expression of the minds of the different races. They were told by Mr. Ruskin that "architecture is the art which so disposes and adorns the edifices raised by man, for whatever uses, that the sight of them may contribute to his mental health, power and pleasure." There was a great deal more in architecture than in merely getting a building to stand up. That was a great thing, but it was not all. Architecture while based upon it was distinguished from mere building. It also differed from the other fine arts in having a utilitarian side. Every art meant something useful, but from prehistoric times they found that men built places in which they lived and kept their tools, &c. Men as soon as they had a place in which to shelter themselves began to use the other arts in the ornamentation of their dwellings. Architecture accepted help from the other arts, and in turn gave help to them. Architecture had something to do with all the other arts. Even with music it would not have been possible for it to have taken such a hold on the people if it had to be given in the open air. It was when they heard music in an enclosed space, in their cathedrals, churches and large buildings that they had its fullest beauty. Then it was that architecture helped the other arts, guided and gave them shelter. He was not there that evening as an architect to discuss and work out to them whether that building was properly erected and portions of it sufficiently strong for the work it had to carry out. He proposed to deal with the more emotional side of architecture and why they should be invited to take an interest in it. The first thing with any art was, that it could not live unless it was rooted in the popular affection. Mr. John Ruskin told them that the only living art was bill-sticking. That was really true, and if they for one moment considered the question they would admit that it was the one in which the majority of people took an interest. Not only must they have people to draw and practise art, but they must also have people to enjoy it. An artist was really like a

shopkeeper; he must be patronised. But what was the present condition of things? If a person or body of people desired to erect a building, plans were asked for; but if the estimate exceeded the sum they were prepared to spend, the first thing done was to knock off the artistic portions. Unless they all worked together for a common end art could not prosper, and they ought to know the history of the arts in order to take that interest which was necessary. Things had changed from what they were in ages gone by with regard to the duties of the architect. Now the architect merely provides the plans, whereas in the bygone ages he was the head workman, so that there was in all work carried out a certain amount of individualism. Until they got the true and best brain power of each individual in the work carried out, architecture, or even sculpture, could not live again as it had lived in the past. While their architects copied the buildings of ancient Greece, they had not the life and spirit but the mere shell of them. Before they could get at the true value of architecture they had to understand its history, like with painting and music. The lecturer then proceeded to trace, by means of lantern illustrations, the course of architecture from the earliest ages. He said the question of supporting a roof was one that had to be well considered. An illustration of the lintel and Pointed and other arches was thrown on the screen, and their relative merits were explained. He said the lintel would not support a heavy weight, while an arch would, although it was necessary in the latter cases to have side supports. He explained the general form of Egyptian buildings in which the square form was used, the decorations of the tombs and temples. Passing on to Greek architecture, he explained that the Greeks undoubtedly took hints from Egypt, Assyria, Persia, Phœnicia, as it seemed improbable that the Greeks could have again invented or had the same ideas as the other nations. The Greeks carried out details to perfection, and the lintel construction, with ordered decoration. There was with them the expressive side of architecture. The lecturer drew special attention to the Parthenon and the other temples on the Acropolis at Athens. Speaking of the sculpture of ancient Greece, he said that no matter what portion of a figure they looked at, they would find life, so to speak, in it. Passing on to the Roman architecture, the lecturer demonstrated the practicability of the Romans, who had brought out the arch to supplant the lintel, the dome, and the splendid work of their practical genius in the buildings erected by them. With Greece there was perfection in ideas, and the workmen from that country were employed to decorate the great undertakings of the Romans, but they had in the great amphitheatre and triumphant arch at Rome introduced construction for decorative purposes.

ARCHÆOLOGY AND ART.

THE Edinburgh University authorities having recognised classical archaeology as an alternative subject for honours in classics, in his opening address as Professor of Fine Art Professor Baldwin Brown treated of the subject. He reminded his auditors that it was while musing amidst the ruins of the Capitol that Edward Gibbon conceived the idea of writing his great history. The study of classical archaeology needed no better justification than this record afforded. Were it not that these material products were the key to much of the life and power of ancient states; were it not that they could discern therein the spirit of their religion, their policy, their conduct, classical archaeology would be a barren collection of details without connection and without significance. As it was, it was a study pregnant with human interest. Taking only, for the moment, the case of Imperial Rome, there, more perhaps even than in Greece, the material monument was the most characteristic production of the people; and not Gibbon only, but every historian, every scholar, who had taken the Eternal City for his theme, had felt his imagination stirred as much by the sight of the stones of Rome as by the written page of Tacitus or Juvenal. Classical archaeology was the science of the old things of the inhabitants of ancient Greece and Italy. The classical curriculum had all along embraced the treatment from various points of view of the language, literature, history and thought of the Greeks and Romans. The inclusion of this new study implied a recognition of it as a kindred study to those already established; it implied that these material objects were now seen to carry with them a considerable amount of instruction about the lives and thoughts of the great peoples of antiquity. In learning about the monuments, the statues, the household appliances of the Greeks and Romans, they were gaining an insight, not otherwise easily acquired, into their ideals, beliefs and customs. Only so far as this was recognised to be the case with the study in question could it with propriety be received into the curriculum. The second point to note was the fact that this new branch of classical lore fell to be dealt with in the department of fine art; and this signified that these material objects were wholly or in great part of an artistic

character. Dealing with the last point, remark was made more particularly of the household objects found at Pompeii; how, whatever their form, they all bore the artistic stamp. In the case of the ancients generally and also of the men of the Middle Ages, the circumstances for such workmanship were of the most favourable description. All the conditions which favoured good artistic work as applied to objects of use were as conspicuously present in their case as they were absent in the case of the workman of to-day. It was not the fault of the latter that his productions are so commonplace, but rather that of his education and surroundings. The artisan who was supposed to be habitually thinking—not of his task, but of the probable success of the next strike, no doubt existed among them, but there existed too the honest craftsman—one knew and respected him—who would ask for nothing better than the chance of turning out his work touched with a little of the nameless charm of the antique. Had he been an ancient Greek or a Mediæval German he would have done as well as they, but the modern condition of production, with the division of labour, the race for cheapness, the competition with the machine, reduced his efforts to impotence. Hence the contrast, so often lamented, in the matter of artistic interest and beauty, between the works of classical and Mediæval craftsmen and our own much-abused surroundings. Again, if the former were almost always beautiful, they were also significant—eloquent of the modes of thought and action of those who made and used them. They were rooted, indeed, so deeply in ancient life that they became a body of records standing side by side with the records these peoples had left of themselves in literature and tradition. The Professor next illustrated at some length the connection between the religion of the ancients and their daily home and outdoor life, and to the part which the worship of the Olympian deities had in the development of decorative art. The recognition of the local deities took, he said, the form of something made or something adorned—in a word, of some of those objects of which the classical archaeologist takes account. Busy were the craftsmen of a land in which such outward tokens of religious veneration were in constant request, while to help them in their task they had the advantage of a copious supply of varied and picturesque artistic motives, taken, it was pointed out, from the history of the gods themselves, their worship or their favourite animals and flowers. A picture was next given by Professor Baldwin Brown of a walk through ancient Hellas, in which its artistic features and surroundings were humorously contrasted with some of the outstanding features of a modern city, such as the gasworks, the railway goods shed or the factory, and it was also shown how the “old things” of the ancients entered into their religious home life. While dealing almost exclusively in his opening lecture with the minor forms of ancient art, the Professor remarked that of course the study of the great masterpieces of Hellenic art in sculpture, painting and architecture must occupy the greater part of any session's work in classical archaeology.

Professor Butcher said that in the early part of the century scholars too often ignored the sidelights which were thrown on literature by art, and it was only since the historical spirit had got thoroughly into classical scholarship in the last twenty-five years that the true value of whatever threw light on ancient modes of life had been appreciated. They really got a defective view of antiquity unless classical archaeology was studied, and he hoped many students, especially honour students, would take advantage of this course of lectures, which could not be had anywhere else in Scotland.

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual meeting of the Glasgow Institute of Architects has just been held, Mr. W. Forrest Salmon, the president, in the chair. Mr. C. J. Maclean, secretary, submitted his report, which made reference to the death of Professor Veitch, one of the honorary members of the Institute, and of Mr. James Hamilton, 112 Bath Street, one of the original members. The number of ordinary members on the roll stood at fifty-two, and the Council has it in view to submit at an early date the names of one or two on whom honorary membership might be conferred. The last of the single examinations will be held next month in London and the provinces, after which the system of graded examinations, promoted by the Royal Institute of British Architects, will come into full force. In the competition for the Alexander Thomson Memorial Prize six sets of drawings were sent in, and after a minute examination by the Trustees, it was decided by a majority that the design marked “Theta” was the best. On the envelopes being opened it was found that the prize drawings were executed by Mr. John H. Craigie, Grantly Street, Shawlands, and a committee was appointed to arrange with Mr. Craigie regarding the four which he is to make in terms of the conditions of the competition. The standing committee on public architecture have had under consideration

the designing of the public buildings of the city of Glasgow, and, on their initiative, the Council of the Institute are in correspondence with the Lord Provost on the subject. The Council were again in communication with the Police Commissioners regarding the promised exhibition of the plans of the bridges proposed to be erected over the Clyde, and a letter was received from the Commissioners stating that the original drawings of the proposed bridges had been departed from, but that the Institute's suggestion as to the public exhibition of the drawings would be kept in view when new drawings had been fixed upon. The finances of the Institute were reported to be in a satisfactory position. The Chairman, in moving the adoption of the report, said they were gradually making the position of the architect as strong and as good as they could. Referring to the correspondence with the Lord Provost, he said there was an opinion abroad that the very large expenditure of money on public buildings were not done in the most judicious way. Their Council had some correspondence with his lordship on the subject, and had suggested that the Town Council should be asked to appoint a committee to consider the advisability of employing independent architects. In this way a selection could be made from a wide circle of architects, among whom will be found diversities of gifts for diversities of employment. The architect had his reputation to sustain, and if employed in public buildings would not be slow to let what light was in him shine forth. Surely it would be for the public advantage that architects of the greatest experience should be employed to design and superintend their buildings. No one could find fault if one in his private capacity should employ an indifferent architect to design his warehouse or his mansion, but when public money was being spent the case was different. The report was unanimously adopted.

THE LATE JOHN GUTHRIE SMITH.

GLASGOW has suffered a great loss by the sudden death, the *Glasgow Herald* says, of Mr. John Guthrie Smith, late Dean of Guild. Mr. Smith was an eminent instance of the truth of the saying that it is only a busy man who has time to do anything. Amid all his distractions and occupations he always found time for reading, and, more wonderful still, for writing. He was a well-read man, but his special province was Scotland and the family history of Scotland. His knowledge of Glasgow was almost unique. He seemed to know all the events of its history and the men who had made it, as if he had lived with these men and been present at these events. The extent of his knowledge was only equalled by his generosity in communicating it to others. He gave a signal instance of this in connection with the late Glasgow exhibition. Time and trouble were lavished on it and it was due to him in no small degree that the exhibition was so successful. His contributions to "The Old Country Houses of the Old Glasgow Gentry"—which was written by him, the late John Buchanan and Dr. J. O. Mitchell—are an invaluable mine of information to all workers at Glasgow history, for he was thorough in all he did, and his accuracy could ever be depended on. His *magnum opus* was "The Parish of Strathblane," published in 1886, a model of what a parish history should be. Indeed, the words "parish history" give but a faint idea of the book. It is rather a history of the West of Scotland, told in the most interesting way, with a wealth of illustration, but without ever losing grip of the main subject, the history of the parish. At the time of his death Mr. Smith was engaged on a history of Strathendrick, and if it be not far enough forward for publication in whole or in part, the history and archaeology of this part of Scotland will have sustained a great loss, for he was an archaeologist of the best type. He had firmly grasped the great principle that the use of archaeology is to connect the past with the present, and so to interpret the present by the past. He was a man who in such matters knew the facts and was invariably accurate, but who made the dry bones live by suffusing the facts with imagination.

TABLETS IN EDINBURGH.

AT the annual meeting of the Edinburgh Pen and Pencil Club Mr. Harrison, on behalf of the tablets committee, presented a report of the work which the club had accomplished in marking houses in the city in which distinguished Edinburgh men had lived. He explained that the committee had adopted a different plan from that followed in London, where a uniform style of tablet was used. In Edinburgh it had been resolved to treat each house separately, according to its architectural character, and in every case they had consulted the tastes, as far as they consistently could, of the different proprietors, both as to the design of the tablet and the material employed. The proposals in regard to the erection of tablets had been most cordially received in the city; but, of course, the procedure

adopted had entailed great labour, and also a considerable expenditure of time. The committee had already placed a tablet on 39 Castle Street in honour of Sir Walter Scott, and tablets had also been placed on the house at the corner of St. Andrew Square and St. David Street, where David Hume lived, and on the house at Comely Bank, where Thomas Carlyle lived. A bronze tablet is to be put up immediately at the top of Lady Stair's Close to draw attention to the house in which Burns lodged when he first came to Edinburgh, and a tablet in the same material had been arranged for and would be erected on a land in the Canongate at the top of Panmure Close, where Adam Smith resided while in Edinburgh. A tablet in honour of Sir Henry Raeburn was in hand and would be placed on the house in York Place which the great portrait-painter erected and in which he worked, and it had been also arranged to place a tablet on 21 St. Andrew Square, in which Lord Brougham had lived. The committee had prepared a further list of eminent men, and tablets on the houses in which they resided would be proceeded with shortly. The list included Hugh Miller; William Robertson, principal of the University; the Rev. Dr. Thomas Chalmers; Dugald Stewart; Lord Jeffrey; Sir William Allan, P.R.S.A.; James Gregory, and John Napier of Merchiston. The committee were authorised to approach the proprietors of the houses in which these men had lived to get their consent to the erection of the proposed tablets.

STREET ARCHITECTURE IN CAPE TOWN.

EVERY citizen is interested in the rebuilding of Cape Town now going on so rapidly, says a writer in the *Cape Times*, and in the style of the street architecture—if style it can be called. A merchant, if he builds a new store, thinks more, perhaps, of the inside accommodation than of the outside appearance, or if he does think of the latter it is probably more as a good advertising elevation than as an elevation artistic in itself and suitable to the street.

It is useless in Cape Town to expect anything like the harmonious style of frontage so welcome and conspicuous in the streets of Melbourne. Until recently a three or four-storeyed building was almost unknown in the city. The result is that the old buildings are utterly dwarfed and put out of countenance by the more ambitious elevations now in progress, and the perspective view of the leading streets presents a jagged sky-line, grotesque in its ugliness. The most enterprising burglar could not climb very far along the roofs of Adderley Street without a long ladder or a fire-escape. The Town Council have forbidden the erection of wood and iron structures in the leading thoroughfares, and are looking after the stability of the buildings, and seeing that the verandah-posts do not encroach too much upon the narrow pavements. It is a pity they cannot go a little further, and secure some sort of harmonious, if not uniform, construction.

Seeing that this cannot be, it may be well to indicate the leading features which should be kept in view in a new street building. It may be said at once that ambitious attempts at ornamental houses are always hideous in a street line. What is called the "pavilion" style of architecture never ought to have a place in a street. Roofs made florid with iron railings, figures on small excrescences—like wash tubs upside down—are simply hideous. A roof-line, or if it sounds better, a sky-line in stone or even cement should always be simple; led up to and relieved by a bold horizontal cornice, but never dotted about with grotesque figures, such as pot-shaped abortions, mostly in stucco. Such excrescences are in bad taste everywhere, but with Table Mountain as a background they are execrable. Let anyone look at the roof-line of the new theatre from the railway station and judge for himself how the little stucco figures, with their hats on one side, look with the bold outline of rock in the rear.

Another vital point in street buildings in the Cape climate is depth of aperture both in window and door, for depth of aperture means shadow. Nothing is more unpleasant than a mere plain unrelieved surface in a glaring sunlight. In this respect and others the new post-office buildings are admirable. Let any one look from it to the huge pile on the other side of the street and mark the contrast when both are in the sunlight. The one has a shallow, cardboard front, with the window-panes almost "flush" with the stucco surface, while the other is relieved throughout by a grateful blending of light and shadow, making the sunshine welcome and the shadow restful. The Town Hall at Port Elizabeth, otherwise a pretty and well-proportioned Italian building, is spoiled by the shallowness of the apertures and the card-board appearance of the façade. Every architect designing even the simplest buildings in a warm climate should read and re-read a passage of John Ruskin's in his "Seven Lamps." "And amongst the first habits," he says, "that a young architect should learn is that of thinking in shadow, not looking at a design in its miserable liny skeleton, but conceiving it as it will be when the daw

lights it and the dusk leaves it; when its stones will be hot and its crannies cool. Let him design with the sense of cold and heat upon him; let him cut out the shadows, as men dig wells in unwatered plains, and lead along the lights as a founder does his hot metal; let him keep the full command of both and see that he knows how they fall and where they fade. His paper lines and proportions are of no value; all that he has to do must be done by spaces of light and darkness; and his business is to see that the one is broad and bold enough not to be swallowed up by twilight, and the other deep enough not to be dried like a shallow pool by a noonday sun."

Ah, says the reader, this is all very well as a canon of high art—and costly art—of cathedral recesses where the "masses of stone" are mighty, and genius and wealth have built the foundations broad and deep, but it does not apply to humbler edifices. This is quite a mistake. It is true canon in the simplest building design to look after the shadow wherever the sun is shining. It is as necessary for a design for a homely restaurant as for a dream in stone. Let our street builders try it. It means of course a substantial wall and so some extra cost.

And while on lights and shadows, I may commend the "loggia" as suitable for a similar reason. It breaks the level of the frontage and gives both shade and shelter. A "loggia," as most readers know, is not a verandah, it is part of the building—an open arcade or space within the outer wall surface. It somewhat darkens the rooms screened by it from the sky-light it is true, but not necessarily more than a verandah, while it gives to the building more character. It cannot, however, often be employed in street architecture, unless for a detached building of some pretension.

As for the general style of a street building, little need be considered beyond the points I have named, except to study simplicity and proportion. It is useless nowadays to commend any particular style for ordinary buildings. So much depends on position and environment—whether "arch" or "lintel," or both, be the form of aperture selected; but much, with the most unpretending building, will depend on due proportion of parts, and, if possible, the entrance to a building should always have some dignity. The new post-office may be quoted as a favourable example. The arch line is the same as that of the windows, but it is on a larger scale, and the arch masonry is solid, striking and dignified, and says plainly, "This is the main entrance to a good building." All entrances do not say this. One or two of the designs for the new Town Hall—one particularly with a well-designed loggia—was spoilt by a small "pimping" entrance, which might have been a back door, or have led to an antechamber.

Architects and builders may now congratulate themselves that they have a chance of building with a good working stone, and that the reign of the eternal cement and stucco, at least as an imitation of stone, is broken, if not ended. Cement, we are told, can be made as hard as stone, or harder than a great deal. So it may, but it never looks it. You cannot manufacture ordinary stone any more than you can manufacture precious stones or marble. Blocks of cement are admirable for sinking into the sea, but not for mimicry of stone if you can possibly help it. Thanks for Saldanha Bay, we can help it now, if we have the will and the money.

Let us not, however, despise such material as we can use. It is fortunate that brick is considered by the critics an honest material. Since it is known to be originally, and we may say "of old time," moulded, there is no reason why it should not be moulded into varied forms. It will never be supposed to have been cut, and therefore will cause no deception, and must have the credit it deserves, and it deserves a great deal. What would the builders have done without these useful servants? But may not the brick ask for better treatment? Why should it be smothered with cement? Who does not prefer a good hard, well-coloured, well-pointed brick to a slop brick covered with plaster? A good red brick is admirable material for Cape Town building, because it does not show the red dust. The "Suffolk rubbers" of the Parliament Houses shine and smile through a south-easter, when the cement of the Standard Bank looks miserably ashamed of itself.

A good word may be said even for stucco or cement in its place. It is offensive only as an imitation of stone. It is one of the most useful building materials, and even allowable for plain surfaces and for covering coarse material, when better cannot be had, but it should not be made to appear what it is not.

On October 25, Messrs. Cassell & Co. will issue the first part of a new serial work entitled "The Story of the Sea." This will contain a series of original illustrations by Messrs. W. H. Overend, J. Nash, Gordon Browne, Paul Hardy, W. C. Symons, C. de Lacy, C. W. Wyllie, R. Peacock, Wal Paget, W. Hatherell, W. H. Margetson, Fred Jane and H. C. Seppings Wright.

PREHISTORIC CIVILISATION.

ON Saturday afternoon Professor Boyd Dawkins gave a lecture upon "Prehistoric Civilisation in Western Europe" at the Manchester Museum. In this discourse, by the aid of copious lantern illustrations, the characteristics of the neolithic age and people were described. It was shown that the new-comers, travelling from Central Asia, represented an important advance in the arts of life as contrasted with palæolithic man (dealt with in the preceding lecture), as evidenced by their tools, weapons and household utensils found in the caves of England and Wales, and in the lakes of Switzerland. It was seen that in this age attention was given to husbandry and the rearing of cattle; that the occupations of weaving, pottery and mining were practised, and the foundation laid of the civilisation of the present day. The evolution of the axe, saw, pick, knife and scissors was traced, and also that of the dressing-comb from the primitive instrument (with the teeth at one end) originally employed in the art of weaving. The nearest descendants of the neolithic people, it was stated, are the Basques of Spain and Portugal, the names of whose working tools point backwards to the time when they were a stone-using people. The invasion of Western Europe by the Celts, a more physically powerful people, who were provided with instruments of bronze and who had a better idea of social and national life, was also referred to.

GENERAL.

The Kirkcaldy Town Council have adopted plans by Messrs. Dun & Findlay, of Edinburgh, for the Adam Smith and Beveridge Halls and Library, which will cost over £2,000. Messrs. Campbell Douglas & Morrison, of Glasgow, have gained second prize, and Mr. E. Simpson, of Stirling, third prize.

Berkeley Chapel, Mayfair, has been embellished with wall-paintings in the chancel, at a cost of about 300*l.*, by Mr. Hemming. The subjects are Christ in Glory, the Bread of Life, the True Vine and the Crucifixion.

Mr. Herbert J. Green, of Norwich, has been appointed architect for the new schools for the Langham School Board.

The Model executed by Mr. John Cassidy, of Manchester, has been selected for the Colston statue which is to be placed on the St. Augustine's open space, Bristol. The pedestal is 10 feet high and the statue will be 8 feet. There were over thirty competitors.

The Chester Town Council, by a majority, have decided that the Hop-pole Paddock is to be utilised as a site for the new baths.

A Society has been formed in Birmingham with the title "Midland Record Society," for the purpose of collecting original, and copies of, ancient documents, records, maps, plans and MSS. having reference to Birmingham or its neighbourhood, or which may have a local or special interest, and the transcribing, copying, or calendaring of such documents. Sir J. B. Stone was appointed president; Alderman Johnson and Sir Richard Tangye, the Rev. Canon Gregory Smith, Mr. Bunce, Mr. Timmins and Mr. J. H. Stone were elected vice-presidents; and Messrs. F. S. Pearson and Wilson Wright were appointed hon. treasurer and hon. secretary respectively.

The "Hymn to Apollo," which is believed to have been composed about B.C. 278, and was discovered engraved on marble at Delphi in May 1893 by the French Archaeological School of Athens, was sung by a quartette of students at the opening of the Senior Greek class in Aberdeen University last week.

The Harwich School Board have given instructions to Mr. J. W. Start, F.S.I., architect, of Colchester, Clacton-on-Sea, and Harwich, to prepare plans for an infants' school to accommodate 150 children at Lower Dovercourt, this being the second block of buildings undertaken by the Board.

Messrs. J. A. Lumley & Co. have sold the Ridgehurst Estate, Shenley, Hertfordshire, to Mr. Edward Speyer.

M. Fantin-Latour, whose portraits and flower-pieces are admired in every Academy exhibition, has been promoted to the grade of officer of the Order of Leopold, being the only French artist among the contributors to the Antwerp exhibition who received the distinction.

The Private View of the autumn exhibition (the thirty-third) of the Nineteenth Century Art Society, at the Conduit Street Galleries, will be on to-morrow, and the exhibition will open to the public on Monday next.

Mr. H. Berkomer gave a lecture at Grassendale on "Art Education or Art Culture." He criticised the modes of teaching art at South Kensington, and in the art schools throughout the country; and pointed out that art culture might be made more successful and the character of the student more fully developed.

The Architect.

THE WEEK.

A STATUE of St. Ambrose has been placed during the week in one of the niches in the drum of the dome of St. Paul's. It completes the series of the Fathers of the Christian Church. The Greeks, St. John Chrysostom, St. Basil the Great, St. Gregory Nazianzen and St. Athanasius are the work of Mr. W. F. WOODINGTON; the Latin or Western Fathers, St. Jerome, St. Ambrose, St. Augustine and St. Gregory the Great were modelled by Mr. C. E. KEMPE, and executed by Messrs. FARMER & BRINDLEY. Bere stone was employed. Each statue is 11 feet 1 inch in height, and weighs, including plinth, about seven tons. The whole work was directed by Mr. F. C. PENROSE, M.A.

THE restoration of the crypt and lady chapel in the church of St. Bartholomew the Great, West Smithfield, continues under the direction of Mr. ASTON WEBB. All the old work that remains is being carefully left undisturbed. The crypt will require nothing more than a roof to restore it to its original condition, but the lady chapel suffered from a fire at some past time, especially on the south side, where, however, a small sedilia has come to light. The funds so far are only sufficient to roof in the chapel and make it secure. The floor, the glazing of the windows, and many other works necessary before the chapel can be incorporated with the rest of the church, must stand over until the last 2,000*l.* required is subscribed. The works have necessitated the removal of the fine collection of worked stones which have been discovered in the various excavations. They have been placed in the north triforium, where they have been carefully arranged in the order of the periods—Norman, Transition Norman, Early English, Decorated and Perpendicular. The tracery of the Perpendicular east windows has been laid out on the floor of the triforium.

THE opening meeting of the winter session of the Northern Architectural Association will be held on the 14th inst., when the President will deliver an address. During the session papers will be read on "The Elizabethan and Renaissance Periods," by Mr. O. H. S. CRANAGE; "The Architect," by Mr. F. CAWS; "The Economics of Architecture," by Mr. H. BARNES; "The Buildings on the Acropolis," by Mr. F. W. RICH; "The Monuments of Egypt," by Mr. WM. MILBURN; "An Evening of Notes," by Mr. J. T. CACKETT; "Ecclesiastical Buildings of Yorkshire," by Mr. J. W. TWIST; "Architectural Sketching," by Mr. R. B. DICK; "Organs and Organ Chambers," by Mr. C. W. HOWDEN.

THE annual report of the Council of the Royal Hibernian Academy states that this year's exhibition was, from a pecuniary point of view, an improvement on those which had been held for some years, and especially that the sales of pictures had realised a sum amounting to nearly 50 per cent. more than at the previous exhibition. The following gentlemen have been elected as officers of the Academy during the next year:—President, Sir Thomas Farrell, R.H.A.; Secretary, S. Catterson Smith, R.H.A.; Treasurer, W. M. Mitchell, R.H.A.; Keeper and Librarian, P. Vincent Duffy, R.H.A. Visitors (Living Model School), P. Vincent Duffy, R.H.A.; J. M. Kavanagh, R.H.A.; R. T. Moynan, R.H.A.; W. Osborne, R.H.A. Visitor (Day Living Model School), S. Catterson Smith, R.H.A. Professor of Painting, Nathaniel Hone, R.H.A.; Professor of Sculpture, Sir Thomas Farrell, R.H.A.; Professor of Architecture, Thomas Drew, R.H.A.; Professor of Anatomy, W. Thornley Stoker, M.D.; Professor of History, W. J. FitzPatrick, LL.D.; Professor of Literature, Edward Dowden, LL.D.; Professor of Antiquities, J. T. Gilbert, LL.D.; Professor of Chemistry, Sir Charles A. Cameron, M.D. Trustees, Sir Thomas Farrell, R.H.A.; S. Catterson Smith, R.H.A.; W. M. Mitchell, R.H.A. Auditors, James Brenan, R.H.A.; Charles Russell, R.H.A. The following resolution was adopted:—"That the members of the Academy, in general meeting assembled, desire to express their deep sense of the

loss the Academy has sustained by the unexpected death of Mr. J. L. Robinson, R.H.A., and direct their secretary to convey to his widow their sympathy in her bereavement."

THE opening meeting of the Architectural Association took place on Friday evening. The proceedings were in some respects unique. Mr. MOUNTFORD has proved almost an exceptional president. As an architect we may congratulate him that his abilities have been substantially acknowledged by the public, who have entrusted to him works of very extensive character. The members of the Association, if we interpret their feelings aright, were only too delighted to express their satisfaction that Mr. MOUNTFORD had consented to serve a second year as president. The medals awarded were designed by Mr. GILBERT, R.A. Not having seen them we cannot describe them. The members have had to wait long for the medals, and for that reason there ensued the curious ceremony of distributing medals not only for the past session, but for the two previous sessions. It is a matter to be recorded in praise of the members that only about nine of the prize-winners were found to forego the privilege of being present to personally receive their awards.

FROM the eighth yearly report of the Scottish History Society it appears that only one of the promised publications of the current year has as yet been issued, viz. Mr. S. R. GARDINER'S "Letters and Papers Illustrating the Relations between Charles II. and Scotland in 1650." Mr. C. H. FIRTH'S volume of "Papers on the Military Occupation of Scotland during the Commonwealth and Protectorate, 1651-60," is, however, in progress. It may be expected early in next year and will be followed by the second volume of the "Registers of the General Assembly." The "Lyon in Mourning," Bishop FORBES'S memorials of 1745, which will occupy two volumes, has been transcribed and is in the hands of the editor, Mr. HENRY PATON. Professor MASSON will also shortly be at work upon the "De Unione Regnorum" of Sir THOMAS CRAIG, the text of which will be printed in both Latin and English. Inquiries have been made regarding documents in Holland relating to the Scots Brigade and the Scottish churches in that country with satisfactory results. Since last general meeting the Council have had the good fortune to be offered some fresh materials well worthy of publication. Mr. SIDDONS MURRAY has placed at disposal four volumes of journals and papers written by Prince CHARLES'S secretary, JOHN MURRAY, of Broughton. Mr. A. C. LAMB, F.S.A.Scot., has given permission to publish the notebook or diary of Bailie DAVID WEDDERBURN, merchant of Dundee, 1587-1630, from the original autograph. Mr. DAVID DOUGLAS has lent to the Society for publication a transcript of a diary of JOHN LAUDER, Lord FOUNTAINHALL; and the Council have also accepted the offer of Mr. WILLIAM MACKAY, Inverness, to edit a series of extracts which he has made from the Presbytery records of Inverness and Dingwall from 1638 to 1688.

It would appear from a remonstrance of the Liverpool Chamber of Commerce that the Government propose to erect a new hospital in the suburbs of Smyrna for British seamen and others. It is considered that the position is not convenient. At present British vessels are heavily taxed for the benefit of the hospitals at Smyrna and Constantinople. From a statement showing the surplus of hospital receipts at Constantinople and Smyrna, presented to Parliament in September 1893, it appears that the surplus receipts at Constantinople had amounted to 14,000*l.* since January 1, 1888, and Smyrna to about 2,000*l.* in the same period. It is urged that the dues were fixed when the tonnage of vessels was smaller than at present, and that the charges should be lowered or abolished; in fact, it is desirable that the hospitals should be supported by voluntary contributions, as in other places, and that shipping should be relieved of the impost. Whether that policy is the best is only to be determined by the experience of shipowners. But as an hospital when once erected is not easily removed, care should be taken that the site of the proposed Smyrna hospital is suitable. Apparently it was selected in Whitehall, without any knowledge of the local conditions.

TECHNICAL EDUCATION.

THE Parliamentary return relating to technical education which was issued a few days ago shows that the amount expended during 1892-93 in England, Wales and Scotland was 529,718*l.* 3*s.* 4*d.* A larger expenditure is anticipated during the present year, for the amount allocated was 696,328*l.* 4*s.* 4*d.* It appears that out of the forty-nine County Councils in England forty-one are applying the whole of the residue under the Local Taxation Act to the purpose, and eight partially apply it. In fifty-three out of the sixty-one "county boroughs" the residue is also applied, and in seven a part of it. In Preston the whole of the residue is employed for the relief of the borough rate. The counties and boroughs of Wales devote all the money obtained under the Act to technical education. Scotland is, on the whole, more eager for the advancement of education than other parts of Britain. It is the fact, however, that only twenty-three out of the thirty-three County Councils are applying the residue to technical education, and seven a part of it, while one has the matter under consideration, and two are utilising the money for the relief of rates. Of the 194 burghs and police burghs, twenty-one are applying the whole and fifty a part of the residue to technical education, while 122 are applying the whole to the relief of rates, and in one case there is as yet no decision on the subject.

It is not to be assumed that the Scottish councillors who hesitate to expend the money obtained from Customs and Excise on "Science, Art, Technical and Manual Instruction" are acting unwisely. We all know there are already facilities in the North for the education of all who care to take advantage of them. Again, the logical disposition of Scotsmen compels them to seek a definition of technical education, and judging by the applications of the money which are given in the return, one that will be generally applicable is not likely to be forthcoming. Take one instance. Every southern visitor to Perth after a day's experience is sure to conclude that the staple trade of the town is dyeing and cleaning. It would be reasonable to suppose that a practical system of technical education would have some relation to the occupation in which so many young people are engaged throughout the year. It appears, however, that the technical subjects which are taught in Perth are "shorthand, book-keeping, writing, arithmetic, commercial arithmetic, mathematics, mensuration, elementary science, chemistry, magnetism and electricity, art subjects, architecture, modern languages, woodwork, &c., swimming (including the instruction of boys and girls attending public schools), and 'University Extension' subjects." Every kind of knowledge has its use, but we can understand the members of many a borough council becoming sceptical about such aids to the development of the trade of Perth as architecture and University Extension subjects, while the 345*l.* received would certainly defray some of the borough expenses. In the county of Renfrew there appears to be more shrewdness displayed, for the whole of the money is expended on "cookery for seamen and butter-making." There is a likelihood that from aims so modest, beneficial results will follow. But what is to be expected when, as in Exeter, we find money lavished on such subjects as pharmacy, précis writing, political economy, &c.?

Birmingham has of late years substituted education for politics as the sovereign thing on earth for the cure of evils, and it would be an advantage if the example of the Midland city were more often followed in other places. The people are not disposed to play with technical education, although there is a temptation to do so, since it is controlled by the Science and Art Department. The sum expended out of the residue was 9,500*l.*, and in addition 3,341*l.* was obtained by rate, making 12,841*l.* The subjects selected on which the money was to be expended were brassfounding, carpentry and joinery, electrical engineering, electrical instrument manufacture, electro-metallurgy, mechanical engineering, metal colouring and bronzing, metal plate work, pattern-making and moulding, plumbing, sanitary science, telegraphy and telephony, the manufacture and working of iron and steel, typography. University professors and seekers after sweetness and light will not approve of the distribution of money on an education that is so unquestionably industrial and local, but in these days there can hardly be too much concentration on the perfecting of trades.

Manchester has also made a prudent selection of subjects, for not only cotton-spinning and weaving, bleaching, dyeing and printing are among them, but some which affect other industries in the city. We cannot understand on what principle "quantities surveying, surveying and levelling" were included. They are subjects which can be useful to no more than a few persons, and it cannot be said there is any lack of surveyors in Manchester or elsewhere in England. If surveying is to be taught by means of surplus Customs and Excise duties, why should not lawyers, physicians and divines receive their training from the same fund? Judging by the return, it would appear that surveying and levelling are becoming rivals of repoussé work in the classes, and as generally taught in the evenings we imagine they are alike amusing. If the authorities would limit the teaching to subjects which might be beneficial in the improvement or increase of exports, there would be far less money wasted.

There is one test by which the character and efficiency of the technical classes can always be determined, viz. the buildings where the classes are held. In the majority of the cases one of the Board schools is utilised for the instruction. As a rule students do not care to renew acquaintance with those buildings. Having gone through the curriculum they are satisfied, and if they seek additional knowledge they prefer to find it somewhere else. Then there is an absurdity in the notion of teaching market-gardening, laundrywork, thatching, brickwork and masonry, farriery, cotton-bleaching, mechanical engineering, brewing, fish-curing and so on in a room that was probably occupied with infant classes a few hours earlier. The power of association is strong among the working-classes, and if the Department's inspectors will condescend to become acquainted with the people who are supposed to be eligible for training, they will discover the existence of a prejudice against the use of children's schools which is an obstacle to the success of the existing system. Whether the use of the buildings by parish councils or other bodies will make them less obnoxious remains to be seen. But so far as we have been able to discover, the secondary utilisation of Board and parish schools generally is a failure.

The proportion of the 529,718*l.* which was expended on building was insignificant and must have been far under the outlay on printing placards, which is apparently one of the main objects of the system. In Reading a sum of 1,450*l.* 6*s.* 9*d.* is charged to building, but according to the return the expenditure was "in order to make suitable provision for the reception of the collection of antiquities from Silchester, and restoring, altering and adapting the ancient building known as the Hospitium, belonging to the Corporation, for the purposes of a school of science." We hope it is not intended to give "manual instruction in woodwork" in the vicinity of glass cases full of Roman antiques. In Chester 2,150*l.* was set aside for building; Barrow-in-Furness obtained 240*l.* for the same purpose; Leicester, 2,250*l.* for museum extension buildings; Oxford, 1,084*l.* towards building central and branch schools, and Halifax was exceptionally fortunate in receiving 3,923*l.* towards the purchase of land and erection of school buildings. But the rest of England, town as well as country, must put up with buildings that are not fitted for the instruction of technical students.

It is remarkable that the summaries of the return are made up in such a way it is impossible to discover the average amount of the "expenses of administration." That of course does not include the sums paid to teachers. Apparently, administration costs from 10 to 12 per cent. of the amount obtained, which is far too much for the simple services that are performed.

NOTES ON THE GREAT RAILWAY STATIONS OF LONDON.—I.

[By A CORRESPONDENT.]

THE writer has thought it might be of some interest to offer a few observations from the architectural, not engineering, point of view, on those huge structures, each forming the terminus to the great trunk lines which radiate from London far down into the country side. The design of an important railway station has frequently been the

prize subject for the students of the architectural societies, and also at the Royal Academy. Some of these conceptions, for which medals have been awarded, have really been excellent, with their lavish display of sculpture, too, of the highest class. But they were only destined to remain—on paper, for in London of recent years, with the rare exception of the Midland Railway terminus at St. Pancras, and quite lately with the extension of the Great Eastern terminus, the directors, in the assumed interest of the shareholders, have generally insisted on cutting down the architectural part of these overgrown “sheds,” while money has been freely expended on other parts of the building where it was supposed the outlay would “pay.” At the same time, in the early part of railway enterprise, it must not be forgotten how far otherwise it was, as at Euston, in the great entrance carriage portico and in the central hall, also at Paddington, and to some extent at King’s Cross. On the Continent the principal façade and general exterior of the principal stations in cities and towns has had the distinct advantage of being the work of an architect, or at any rate the engineer has been materially helped in the art part by the former. The enormous hotels, which in several of the London termini entirely mask the railway station behind, are not so commonly found abroad in this situation, so that the outward suggestion of the internal arrangement is more often patent, which certainly is an advantage.

There are, indeed, at the present day few more important factors in our national life than these points of arrival and departure, which the large majority of mankind constantly use either for business or pleasure, and yet it is scarcely sixty years since these institutions were non-existent. It was this feeling which inspired the painter FRITH in his well-known picture of the Great Western Station at Paddington, in which he incorporated, in a dramatic way, many of the heterogeneous scenes which from time to time are occurring at such places. Railway stations are legally public places so long as people do not transgress the law of the land or the by-laws of the company. Though very many are too much in a hurry to look about or take in what they see, yet there are others who have plenty of time on their hands and must perforce wait. Would that there were something better for the eye to study than is usual, where obtrusive and vulgar advertisements flaunt themselves to the ruin of true art! There is but faint hope that commercial instincts will give way in this particular respect, unless it should happen that a new architectural departure takes place in the future terminus in London of the Manchester, Sheffield and Lincoln line at Marylebone, which it is believed will be in a good open situation. Here would be truly a grand opportunity, unless the counsels of the hideous Watkin Tower party prevail, when we should know what to expect. If in the comments which follow the writer “trips” in engineering phraseology, he must sue for pardon, as it has not come in his particular practice as an architect to have to deal with large structures where iron is the principal material used. Familiar as he has been with nearly all the great London railway stations, through using them like many other passengers since boyhood, it was not till he made a special examination of each for the purposes of these articles that he noticed some useful points which, as an ordinary wayfarer, would not have at first impressed him. There is no intention of attempting a guide-book description of the buildings commented upon, as it is assumed they are sufficiently familiar to the readers of *The Architect*. So only those features will be discussed which are salient to the object the writer has in view. Thus much as a prelude. It will be well to commence with the comments on the *older* stations without attempting too strict a chronological order, as this is no exhaustive article on the subject, but only a *brochure*.

Externally the Great Western terminus at Paddington has few architectural pretensions, seen from Eastbourne Terrace, with its booking-offices and clerks’ and other rooms above of commonplace character, while the hotel blocks the south-east end next Praed Street, though there is a wide space between it and the station, utilised for the storage of waggons, &c., and covered over by a low roof, above which the end of the station proper is observable by a side view, no attempt having been made to make any feature of it. The north-east side is a *terra incognita* to most people, except to the cabmen for the arrival platforms, and the

station has no “elevation” there. In fact, without intending to make a pun, the whole of it is looked down upon, being in a cutting, an obvious disadvantage architecturally. What has happened at Paddington is the case with most of the large London stations as regards the elevation, one only, or at most two, sides being visible to the general public, and the rest practically invisible. The writer mentions this, as it will save time in the notes on other stations. In describing the various ground-plans it will be convenient to use those terms which are more commonly applied to ecclesiastical work, *i.e.* nave, aisles and transept. In the case of this building, the plan consists of a wide nave and narrower aisles, having span roofs and two transept-like roofs in the total length. As the north and south ends of the transept ends are *flush* with the sides of the aisles, the term must be taken in rather a Pickwickian sense. There seems no particular object beyond appearance in this arrangement, which must be more expensive constructionally than running the nave and aisles east to west continuously, like the ordinary plan of Cornish churches. But the writer has often admired its effectiveness and the very striking look of the great diagonal ribs at the junction of the several roofs. Though the nave or central roof is considerably wider than the aisles the roof construction is the same, being that of a series of arched flanged iron trusses (without any tie-rods) set not far apart, the principals being occasionally perforated by quatrefoils and other geometrical forms, and only panelled near the springing-line with ornament of a semi-Gothic, semi-Moorish character. The upper part of the roof is glazed on that useful plan, the ridge-and-furrow construction. The late OWEN JONES was wisely consulted by the promoters in its decorative features, and though one of the earliest built, it still well passes muster as compared with later examples of the London terminus. The more modern idea, arising from the enterprise of civil engineers and fostered by the ambition of railway directors, has been to roof all in one span, which desire, though it may be laudable, has landed the builders in unnecessary difficulties, such as would not have occurred had more subdivisions of the width been adopted. The idea of enclosing everything under one big roof was a pretty one, but in practice it will be found that the placing of the intermediate supports necessitated by several spans causes no inconvenience, as is evident on examining some of the large London stations. Possibly smoke and steam hang less about the lofty one-span roofs than in the subdivided one. This is an annoyance sometimes, as at the Victoria terminus of the London, Brighton and South Coast Railway. On the other hand, there is the disadvantage in the former type that the size of the huge roof destroys the scale of everything near and beneath it, and where there are stacks of chimneys to offices or other buildings they refuse to properly “draw,” as at the Midland Station, St. Pancras. Of course there is greater scope for the design and arrangement of the side walls of the one-span roof, owing to the increased height up to the plate. Probably very few of the hurrying passengers who cross the footbridge at the west end of the Paddington Station ever care to look at the view towards the south-east, which is really very effective, though the advocates of the so-called grander examples would say it wants more height. The double transept arrangement of roof, previously commented upon, helps to break that monotonous tunnel-like appearance which other stations have, not to say some cathedrals and churches, and as far as the writer is aware, there is no other such example in London. The two oriel-like structures with Moorish geometrical pattern balustrades that project over the main platform on the departure side, opposite the transepts, as well as the wider central one with semi-domical roof, are indeed very different in their delicate treatment to the average civil engineer’s conception, and thus betray the vanished hand of their artist-architect, OWEN JONES. These picturesque little bits of detail must have delighted many an observant, appreciative traveller waiting for his train to start, though it is to be feared there are a very large number of passengers who resemble the man who went from Dan to Beer Sheba and found all was barren. Though by no means faultless, viewed by present-day ideas, there is nothing vulgar in the ornament of this station, which is refined throughout.

The terminus of the Great Northern Railway at King’s Cross certainly has nothing whatever meretricious in the de-

sign of its façade, which is honest and plain enough in all truth, built substantially of stock bricks without any other material being used. There is the clock turret in the centre, of campanile-like character, and what some ultra-purists would call that dreadful "sham," for all else is a mere front. But in this case everything is transparent, for anyone can peep through the big arched glass panels at the south side of the station and see the horizontal cornice sailing serenely above, regardless of what is obviously beneath and behind. Who is the worse for this? Who is deceived, speaking artistically? Nobody, of course. Though treated in a rather crude way, this façade is a good example of that gentle veiling of what, in all likelihood, would have been an ugly termination, considering the ordinary section of a station roof. Those two arches of great width at the front of this two-aisled terminus, with their several brick rings and orders, were considered a marvel when built, and even now arrest the attention of those who use their eyes. The writer is of decided opinion that in these immense stations, with the large-spanned roofs of the customary type, it is better to mask the ends as done here, or by a hotel or other buildings, so as to effectually stop the big unmanageable shed end. The late historian E. A. FREEMAN used, on architectural principles, to severely denounce the composition of the glorious west front of Wells Cathedral, because its outline did not follow the section of the nave and lean-to aisles, and moreover, the towers, *mirabile dictu*, by the "perversity" of the Mediæval builders were, contrary to the usual procedure, set beyond the aisles on each side, so as to give better scope for the display of sculpture, which extends round these towers except on the engaged side. But no excuse can be offered at King's Cross, artistically, for the obtrusive manner in which some quasi-ornamental shed-like buildings, with rustic arbour-work structures, besides a great deal of litter, conceal the lower part of the station and come in front of the omnibus and cab covered way. There is certainly nothing very much to be proud of in the lower portion of this façade, but the interception is to be regretted, where in all other respects the site is so very open a one, and is scarcely worthy of a wealthy Company. Beyond this plain south front the station has really no architectural pretensions, as the side towards York Road has a species of annexe for cabs attached to the main building, with stores or offices above. Everything is treated in the plainest way, and ordinary stock bricks employed. The booking-office is a lofty hall with flat plaster ceiling having well recessed panels, with a deep cove next the walls. The ticket offices are of the usual ugly character. The gallery or passage which runs along the east wall of the booking-hall at a good elevation is carried on iron cantilevers of poor design, and it is a pity more was not made of what could easily have formed an effective feature if well treated.

(To be continued.)

WILHELM LÜBKE.

THE name of WILHELM LÜBKE is not unknown in this country. The author of such works as "The History of Architecture," "History of the German Renaissance," "History of the French Renaissance," "Foundations of the History of Art," "Mediæval Art in Westphalia," and other writings, some of which have been translated into English and are employed as text-books, must be considered as a sort of cosmopolitan rather than a German. The arts to which he consecrated his life are not to be "cabined, cribbed, confined" by any political boundaries.

As an author he has peculiar interest for us, because what constitutes his principal claim to attention among his countrymen is that he was an imitator of an English system. LÜBKE's volumes have created many adversaries in Germany, but everybody is agreed that he was one of the earliest to make the history of art comprehensible to the multitude. It is maintained, however, that if he succeeded the principal cause was the quantity of the illustrations, and in employing them he was only imitating English precedents.

It is not sufficiently understood that until almost recent times England was far in advance of Germany in the

illustration of books. As soon as CHARLES KNIGHT, with the aid of WILLIAM HARVEY, JACKSON and other artists, had demonstrated that a magazine which was sold for a penny could be embellished with beautiful cuts (some of them costing as much as 50¢), a new era in literature was opened. The artist became an auxiliary of the writer, and by his aid things which were remote became almost ocularly visible. But that aid was not much valued in Germany. The people were habituated to reflection, and they were content with the notions of things which they could themselves create by the help of descriptions. For example there are not many books more crammed with information than KUGLER's "Handbuch der Kunstgeschichte," which the most accomplished of the Prussian monarchs was glad to have dedicated to himself; but the reader has to realise for himself the myriads of buildings, pictures, statues, glass-paintings and other memorials representative of art, from the earliest ages to the nineteenth century, without the help of a single vignette or tailpiece. KUGLER was simply following the common practice, and he was certain that no complaints would arise from the omission. As professor in the Berlin Academy he knew all about the requirements of students.

If in our time a similar Handbuch could not expect to be successful in Germany unless it contained many hundreds or thousands of illustrations, the change must be attributed to the precedent set up by LÜBKE. He was able to claim for himself that he was the first German to whom the thought came that a book relating to works of art required woodcuts, and whatever merit that position can afford unquestionably belongs to him. The innovation was no sudden inspiration; it was the consequence of a long course of training on the part of LÜBKE, and the political changes which in Germany followed the revolutions of 1848 were not without some effect upon it.

LÜBKE was a representative German, one of those men who seem to be destined by nature to be professors, curators of museums, or other variety of dispensers of knowledge. He was born in 1826 in Dortmund, Westphalia. His father was the schoolmaster, whose residence was in the old Dominican monastery. In the town were many other remains of Mediæval architecture which were likely to impress a susceptible boy, especially when they were explained by an affectionate teacher. Young LÜBKE's training was as careful as could be accomplished, for it was necessary for him to take some of the classes as soon as he was competent. He was also required to serve occasionally as organist in the church of Dortmund. The obligations were accepted in good-will, for he realised that teaching imparted definiteness to his knowledge. When in the usual course of things he went to Bonn, in 1845, he was successful in the examinations, and it was not long before he obtained employment in helping students who were less advanced.

He was no less fortunate in other ways. GÖTTFRIED KINKEL, who was subsequently esteemed during his long exile in London, was one of the professors, and there was no man in Germany who was more enthusiastic about art as one of the motive powers of the world. KINKEL's influence on students was so extraordinary, it is no wonder he was feared by the Government when a few years afterwards Young Germany resolved to assert itself. Still more important for LÜBKE was his acquaintance with ANDREAS SIMONS, the Darmstadt professor of architecture, who convinced him that the best place to study the history of art is in front of the examples—advice that was novel to a German. LÜBKE accepted it and was faithful in its observance. By many critics he was taken to be no more than a bookmaker, but for every one of his histories he made repeated journeys in order that the pages might embody his impressions. He began with a study of the Romanesque remains between Cologne and Treves. From Bonn he passed to the University of Berlin, ostensibly to pursue his philological studies. Art, however, continued to exercise its sway over him. In the capital he was able to see a large number of paintings and other examples of art, while in the University he was able to continue his studies of the history of art under Dr. WAAGEN (the author of the "Art Treasures") and Professor HOTH. In Berlin also he became acquainted with JACOB BURCKHARDT, whose "Cicerone" is the best of all guide-books for Italy.

A young man of twenty-two who admired KINKEL was

not likely to be callous when, in the beginning of 1848, Berlin appeared to be emulous of the fame just acquired by Paris in overthrowing royalty. LÜBKE was suspected, and was ordered to withdraw from the city. WAAGEN was not satisfied to lose so promising a disciple, and he exerted all his influence to obtain a revocation of the decree. He was successful.

The earlier financial results of LÜBKE's devotion to the history of art were of a kind which only a young and enthusiastic German could endure. For an investigation of the Westphalian land, in order to describe the Mediæval remains, he received only 250 thalers. But it gave him a right to be considered as an author. His introduction to the study of Mediæval church architecture was hardly more profitable. But the books were sufficient to enable the best judges to perceive the extent of his learning and his sound judgment, and in Germany that would be considered an adequate return for his labour. A great many works requiring far more toil have been produced with the expectation of no other result. LÜBKE was not however satisfied with a reputation that depended on a few professors. He perceived that the interest in the history of art, and especially of architecture, was no longer confined to men like himself. But he felt that the new students must have a different sort of instruction. They were not to be satisfied with abstractions, and he could not expect them to devote the regulation year of wandering to a contemplation of buildings. As a sort of middle course he resolved to utilise woodcut representations to supplement and enhance the descriptions. The adoption of that course may now seem a trivial affair, especially in England, where fine illustrations of buildings were produced sixty years ago by CHARLES KNIGHT in the *Penny Magazine*. But Germany in those days did not keep pace with either England or France. A few popular books were no doubt illustrated, but it is much easier to prepare designs for a history or a book of poetry than views for a volume on architecture. The designs for a belles-lettres work could be created by an artist without leaving his studio, while to represent buildings it was necessary to travel, which in all lands requires money. It was long before LÜBKE could convince a publisher to undertake so costly an experiment. He succeeded at last, and when the "Geschichte der Architektur," with over four hundred cuts, appeared in 1855, it was welcomed as a novelty, and in the course of three years the first edition was exhausted.

One of the results was the appointment of LÜBKE as a teacher in the Bauakademie, or architectural school of Berlin. There he made a good impression among the students. Amateurs as well as young architects found profit in his lectures. He also busied himself with contributions to various journals and in his criticisms he was almost too generous. LÜBKE's ability was recognised in many places, and as the Swiss are always on the look-out for clever teachers he was offered a professorship in Zurich. He preferred to remain for a time in Berlin. He was engaged in preparing his "Grundriss der Kunst-Geschichte," and as it was to contain as many illustrations as the former work it was an advantage to be near the artists and engravers. It appeared in 1860, and judging by the number of editions it may be considered as the most popular of his books. LÜBKE was then able to accept the appointment which was kept for him in Zurich, and during six years he proved himself to be a worthy companion of the band of professors that had won a new reputation for the University. From Zurich he transferred himself to Stuttgart.

It was characteristic of LÜBKE that in proportion as he was esteemed as a master, his work as a student went on increasing. He travelled through Italy, France, Belgium and England, Germany and Switzerland, in search of additional information, as if European art appeared to him an inexhaustible subject. It was during one of those expeditions he met with an accident which would have imposed retirement on many a man. While an architect was discussing with him the characteristics of a building and pointing out details, he unluckily injured one of LÜBKE's eyes with his umbrella. In a short time the Professor could no longer see with it, and the greatest precautions were necessary to keep the other eye from becoming useless. LÜBKE was not to be restrained. If he was incompetent to write he was able to dictate, and

his literary productions were turned out with the usual punctuality.

LÜBKE remained in Stuttgart for the long period of nineteen years, and in spite of illness and other obstacles, faithfully discharged his duties as professor. He was the right man for the office. But he imagined that his knowledge would become more useful in a different place, and he accepted a professorship in Karlsruhe, and there he remained until his death in the early part of last year.

If LÜBKE deserves the credit of introducing a new era in technical literature among his countrymen, it may also be said of him that he contributed to the downfall of the class of writers of whom he was a representative. He created a desire for illustrations, and as the appetite grows with what it feeds on, a history of art with only four hundred examples was considered as being only meagre fare for an ordinary student. The importance of the descriptions and criticism gradually diminished, and instead of supplementing them, the pictures became "the end-all and the be-all" of every book on art that was destined for popularity. As a consequence the long and anxious preparations which were gone through by LÜBKE are ignored, and the value of his books has fallen in the market far more than is reasonable. Photographs not only made his and similar woodcuts and illustrations appear wanting in the accuracy which is indispensable in all technical books, but as by the process various views of one work are easily obtainable, a reaction in favour of special subjects was created. LÜBKE's books are comparable to maps of the world; the newest tendency is towards works which resemble plans on the largest scale.

CHURCH OF ST. LAURENT, AT ROUEN.

IT appears from a communication from M. Ad. Guillon, of Vézelay, to the current number of *L'Ami des Monuments*, the official organ of the French Society for the Protection of Ancient Buildings, which is edited by M. Charles Normand (vol. viii. page 223), that the church of St. Laurent, at Rouen, one of the most interesting examples of fifteenth-century architecture in the Rue Thiers, near the picture gallery, has been purchased compulsorily by the Government under the provisions of the Law of March 30, 1887, with regard to public buildings, which has been put into operation for the first time. The church was the property of M. Courcelle, a notary at Rouen, who proposed to pull down the nave and the external walls, and to convert the church into a private house, retaining the tower and the porch next the Rue de la Bibliothèque, which he proposed to restore. M. Courcelle claimed nearly 26,000*l.* as compensation and was awarded 7,200*l.* The church will now be preserved in its entirety, and this result is largely due to the exertions of the recently established Society for the Protection of the Public Buildings of Rouen, and its president, M. Gaston le Breton.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE Birmingham Architectural Association opened their twentieth session with a conversazione, exhibition of drawings and smoking concert on Monday last. Mr. W. Henman presided, and was supported by Messrs. F. B. Peacock, H. H. McConnal, E. C. Bewlay, A. Harrison, A. Reading and the hon. secs. (C. E. Bateman and H. T. Buckland). Drawings were exhibited by Messrs. A. Harrison, Bewlay, Swan, McKewan, Hart, Son, Peard & Co.; Essex, Nicol & Goodman; also by Messrs. Ernest George & Peto, J. Brooks, R. Briggs, M. B. Adams, E. Newton, G. C. Horsley and other London architects. Before the smoking concert commenced the President handed prizes to Mr. W. J. Pritchard for the best set of measured drawings; to Mr. G. McMichael for the best essay on construction; and to Mr. E. B. Clarke for the best description of buildings in course of construction visited by members of the Association during the past season. Among those who assisted in the musical programme were Messrs. H. Lee Matthews, W. Crosbee, Whitworth Wallis, F. G. Hughes and W. Pritchett. A very pleasant evening was spent.

M. Leon Palustre, the author of a volume on Renaissance architecture and other works relating to art in France, has died in Tours. During the current year he was engaged on a series of articles about French artists of the sixteenth century.

TESSERÆ.

English Monumental Sculpture.

SCULPTURE was so little employed that it is believed there is no sepulchral statue in England of earlier date than towards the end of the eleventh century, though the French had begun to decorate their coffin-lids with figures, &c., as early as the ninth. We may conclude, therefore, that this practice was first introduced into the country at the Norman invasion. All the oldest monuments in which figures are thus represented are of ecclesiastics. Two specimens of these sculptured effigies, carved in very low relief on coffin shaped slabs, may be seen in the cloisters of Westminster Abbey. They are supposed to represent two abbots, Vitalis, who died in 1087, and Crispinus, who died in 1117. Similar monuments are preserved in Worcester Cathedral of St. Oswald and Bishop Wulstan. These sculptures, of extremely rude design and workmanship, have been much injured by time and violence, but they are curious as the earliest examples of the kind in this country. It has been thought probable that one reason for not decorating with figures or any distinguishing device the stone coffins in which more illustrious persons were enclosed, was to preserve them from the chance of violence which might have been offered to them, in order to gain possession of the ornaments that usually were deposited with individuals of exalted rank. Several monuments of bishops and abbots which have been opened have shown the deceased fully habited in his episcopal robes, with his ring on his hand and an enriched crozier either lying by his side or across the body. The more sacred character of the occupant of the tomb, and of the objects buried with him, might prevent any indignity being offered to them; but kings and princes would not be considered in the same view, and as they would no doubt be even more richly dressed than ecclesiastics, however high their rank, their tombs would offer greater temptation to sacrilegious avarice. The circumstance of the tomb of William Rufus in Winchester Cathedral being entirely devoid of ornament may be thus accounted for. That of Gundred, daughter of William the Conqueror, at St. John's Church, Southover, is inscribed and embellished with foliage, heads and other decorations, but there is no figure of the deceased on it. When the Crusaders returned from the Holy Land they endeavoured to introduce into England a taste for the magnificence they had witnessed in foreign countries, and imitations were attempted of the rich foliage and other decorations employed in their architecture. In the west door of Rochester Cathedral are some figures so applied. Probably the earliest specimen in England of figures in armour is of the time of Richard I. Those in the Temple Church, of Magnaville or Mandeville, Earl of Essex, and of two other knights similarly habited, may be of that date. The first example that occurs in England of a monumental figure in royal costume is that of King John, on his tomb in Worcester Cathedral. An interesting proof that the figures carved on the lids of tombs were tolerably accurate representations of the persons whose remains they contained, was afforded by the opening of the coffin of King John in the year 1797. The body, &c., was in a state of sufficient preservation to show that it had been dressed in precisely the same costume as that represented in the sculptured effigy.

Columniation and Fenestration.

Different orders or repetitions of the same order being applied to the several storeys of buildings whose fronts were pierced with windows, it became unavoidably necessary to abandon all proportion of intercolumniation and to space the columns according to the breadth of the piers and the apertures between them. That arrangement in turn left hardly any alternative than to engage the columns themselves, that is, to attach either half or three-quarter columns to the walls, because insulated columns placed so wide apart from each other would have had an exceedingly poor and meagre effect. Moreover, where one order was placed above another, two straggling rows of low insulated pillars—for low they must be in comparison with the entire height—would have produced an appearance positively disagreeable, and instead of at all ornamenting a building, would have encumbered it with what would have resembled stages of scaffolding. Should anyone question this, he has merely to fancy all the columns brought forward two or three feet in the front of Whitehall Chapel, and then judge whether it would be at all improved by two such sprawling galleries standing before it. For a somewhat similar reason, either pilasters were substituted for engaged columns, or the entablature was made to break over every column—as in the building just mentioned, which may be referred to as a tolerably characteristic specimen of Italian style in buildings of that class, without those capricious abnormalities which so frequently offend us even in the buildings of Palladio himself, although he has the reputation of being comparatively chaste in his designs. For if, instead of being thus broken, the entablature were continued from column to column in each storey overhanging the face of the wall, it would produce the

appearance of heaviness as well as weakness. One defect attending this practice of giving a separate order to each storey is that the columns become insignificant both in proportion to the entire front and to the windows between them, more especially when the columns are further shortened by being placed on pedestals. In fact, windows and doors are generally the predominant features in Italian composition, even where two series are comprised within one order, being generally more prominent in their cornices and pediments than the other projections. They are often decorated with smaller columns or pilasters, and Palladio has sometimes loaded them by recumbent figures on the raking cornices of their pediments. Sometimes, as in the upper order of the Procuratie Nuove, by Scamozzi, at Venice, the windows (decorated with a lesser order) are carried up to the height of the capitals. In the court of the Louvre the pediments of the windows come immediately beneath the architrave of the order, so that in proportion to the entire mass and to the windows, the entablatures of the several orders become little more than deep moulded string-courses dividing the storeys of the building, and the columns mere expletive decorations attached to the piers. The ornamental details may be in imitation of the members of an ancient order, but the character of the antique itself is entirely gone. Even where the windows are kept more subordinate to the order itself, the effect of the latter is frequently diminished by the addition of a heavy attic pierced with windows occupying its entire length and surmounted in turn by a balustrade, having perhaps a formal row of statues on its pedestals, which viewed at a little distance assume the appearance of so many pinnacles on the summit of the building, while the balusters themselves in such case suggest the idea of perforated battlements, in which, we may remark, they appear to have originated, since there can be little doubt that their name is derived from *balestra*, the cross-bow, from which arrows were shot through apertures in the parapets of fortified buildings.

The Mile and the League.

The leuca of the ancient English law-writers is necessary to be determined before the rights given by many charters can be defined; but unfortunately the length of this measure is enveloped in utter confusion. Modern lawyers evade the question by setting it down as a mile; thus the legal minimum distance between two markets, which was certainly seven leuca, is now called seven miles. By citations in Du Cange, Paucet, &c., it appears that Hesychius distinctly describes the *leugē*, and Jerome, Jornandes, &c., the leuca (stated by Camden to be derived from the Celtic *leach*, a stone), as a Gaulish measure, and the original Gallic league was set down by the Romans as a mile and a half of their own measure, which was in all probability a rough estimation first used in the Itinerary of Antoninus. In that work the distances from place to place in Gaul are frequently given in leagues (always in whole numbers), which are in every instance reduced to Roman miles at the rate of a mile and a half to each league. Hence, taking the Roman foot at 11.62 English inches (which is a mean between the most trustworthy measures) and the pace of five feet at 58.1 inches, the Roman mile of 1,000 paces is 1,614 English yards, and the leuca was therefore 2,421 yards, subject to the error of the Roman estimation, or 1.376 modern English miles, with the same reservation. This leuca in all probability was brought by the Normans into England. It is true that the Saxon charters of Ingulphus describe distances in leuca, but the genuineness of these charters is now considered more than questionable, and perhaps this very circumstance is a presumption against them. But the leuca soon began to vary in size. Du Cange cites an old metrologist who speaks of two leuca, the one legal, of 3,000 paces, the other common, varying much in different countries. In the confusion incident to our subject it will be worth while to remember that it was not uncommon, when a measure was found too short for convenience, to double it without altering its name; thus among the list of old coins (1540) given by John Dee is found the penny of two pence. The registers of Battle Abbey (Sir H. Ellis) and the "Monasticon Anglicanum" (Du Cange) describe the leuca as containing 12 *quarantena* or furlongs. Now the furlong (forty-long) is always 40 perches, and the perch, though varying much, yet was settled very early at 16½ feet. This gives a modern statute mile and a half to the leuca; so that a certain set of old authorities countenance the notion that the leuca was in their time very little more than that of the Gauls. It is not worth while to take into account any possible variations of the foot, since all the information we can obtain is too rough even to make the whole difference between the Roman and modern English foot of consequence.

The Peplos of the Parthenon.

Every fifth year a new peplos, peplum, or sacred veil was carried in solemn procession to the Parthenon. It appears to have been an extraordinary work of female ingenuity. It was a piece of embroidery, or perhaps of tapestry, on which all the women of distinction in Athens were proud to be employed

it was planned, and all the more delicate details worked out by them, while the younger females of their households, as also Trojan female slaves, were employed in subordinate departments. It might seem that anything which could appropriately receive the name of a veil would be too small to afford scope for so many workers; but it must be borne in mind that the statue itself was 40 feet in height. The garment worn by the Greek females under the name of peplos was a sort of large shawl which could envelop nearly the whole or only a part of the person of the wearer, according as she pleased; and it was also sometimes thrown around the head; so that this costly peplos for the Minerva statue was probably large enough to cover the entire figure, and must therefore have had a great extent of surface. The subjects embroidered on the peplos were the heroic deeds of the Athenian heroes, aided by their redoubtable goddess. The destruction of the Titans and of the Giants were favourite subjects, as were others of a mythological character; but by degrees a spirit of adulation led to the custom of embroidering the names, the portraits, or the achievements of living heroes on the peplos; an honour which was too gratifying to be resisted by those to whom it was offered, however derogatory to the more solemn and mythological spirit which instituted the ceremony. In order to give greater pomp a ship was constructed to carry the peplos. This ship was provided with concealed machinery as a motive power, and the peplos was spread out upon the masts like a sail. The ship, chariots, horses, beasts for sacrifice, and other component parts of the procession, were assembled in an open place called the Ceramicus, from whence they went through and about Athens, and ascended the Acropolis. Having reached an open place in front of the Parthenon, they formed two lines or parties, which, beginning at the south-west angle of the temple, went round it in great state in opposite directions; one passing along the south side from west to east, and thence to the centre of the eastern side; and the other passing along the west and north sides to the centre of the east side. Here both parties joined. The procession was of a most varied character. Old men bearing branches of the sacred olive; matrons of advanced years similarly but lightly burdened; citizens of Athens, vigorous of form, and carrying spears and shields; occasional sojourners at Athens, bearing vessels and other implements; wives of the Athenians, attended by the wives of the sojourners, who carried water-vessels for them; daughters of the Athenians, attended by daughters of the sojourners, who held umbrellas over them (for the Athenians were always careful to proclaim their superiority over their neighbours); youths wearing only slight scarves, and singing praises to Minerva; young women of high repute and esteem, dressed with the utmost splendour, and bearing costly vessels and caskets to be used in the sacrifices; other young females, probably of lower rank, carrying umbrellas, vessels of water and seats, for those of greater rank; these, besides the hip, chariots, horsemen and animals to be sacrificed, formed a splendid array.

Sir John Soane's Ceiling Lights.

Soane is believed to have been almost the first who attempted to give importance and decorative character to skylights and ceiling windows, or windowed ceilings, as they may be termed, making them ornamental features in his interiors, varied in their design, and producing great diversity of striking effects, occasionally heightened by the light being transmitted through tinted glass, so as to diffuse a warm sunny glow over the apartment. The offices at the Bank of England afford many studies of the kind, while his own house (now the Soane Museum) shows what he accomplished by a similar mode of treatment upon a very limited scale. It cannot be said that the taste which he otherwise displayed in internal architecture, even in those instances, was the most refined, for it was exceedingly unequal; yet many valuable hints may be derived from what he did in that way, and it seems to have had the good result of inducing others to render such method of lighting interiors highly effective and ornamental. Among other novel contrivances, Soane occasionally introduced narrow skylights or glazed panels around the ceiling of a room, not for the purpose of lighting the whole of it, but of obtaining a strong light immediately on the upper part of the walls and on pictures in that situation, an effect rendered more striking in consequence of such openings being made above the general level of the ceiling, and therefore in some measure screened from view. At other times he occasionally placed a lantern immediately upon the walls of a room, that is, he carried up the latter above the roof, opening windows in it on every side, immediately below the ceiling.

Domesday Book.

The Domesday Book of William the Conqueror contains the results of a minute survey taken by commissioners appointed by that king and completed in 1086. Ingulphus, a contemporary writer, states this survey to have been made upon the model of an earlier work of the same nature ordered by Alfred and called the "Roll of Winchester." No such record,

however, has been discovered, and its existence at any time is doubted. It has been supposed, with some appearance of probability, that the "Dome-boc" of Alfred, which is not a survey, but the code of Saxon laws, may have been confounded, by reason of the similarity of name, with the later work called "Domesday." This supposition is confirmed by the fact that the latter was also called "Liber de Wintonia" and "Rotulus Wintoniæ," as the inquiries when taken were sent to Winchester and there entered in a register. This survey extended to the names of the owners of all lands in the reign of Edward the Confessor and at the time of the survey; the number of tenants and serfs of different ranks and denominations, the divisions, quantity, tenure and value of lands, whether pasture or arable; forests, parks or vineyards, the number and value of mills, salt, iron and leadworks, fisheries and other property, and whether any advance could be made in the value. So minute was the inquiry that in some counties the number of young cattle, sheep and working horses is stated, and even how many hogs the woods will support. "So very narrowly, indeed," says the Saxon Chronicle, "did he commission them to trace it out that there was not a single hide nor a yard of land, nay, moreover (it is shameful to tell, though he thought it no shame to do it), not even an ox nor a cow nor a swine was there left that was not set down in his writ."

The Old Southwark Bridge.

The wooden bridge which connected Southwark with London was burned in a fire which consumed great part of the city (A.D. 1136). It was however repaired in a few years afterwards, and in A.D. 1163 still more thoroughly restored. It is probable that the charge of these repairs led to the erection of a more stable fabric of stone (A.D. 1176-1209), which remained till within the last few years. The old timber bridge appears to have been opposite Botolph Wharf, midway between the Custom House and the present bridge; the former stone bridge was between the timber bridge and the present one, at the foot of Fish Street Hill. In order to the erection of the stone bridge, a new channel was cut for the stream, so as to lay the natural bed of the river nearly dry. It appears that the bridge was not at first wholly occupied with houses, for in A.D. 1395 there was a tournament held on it. Stow infers from this that there were then no houses at all on the bridge, but such an inference is by no means necessary. In A.D. 1471 there were houses, several being burned by the Bastard of Fauconbridge. There appears to have been from the first a drawbridge so as to allow the passage of vessels above bridge; also a chapel on the east side; and two towers for defence, one at the south end of the bridge and the other at the north end of the drawbridge. The bridge underwent many alterations and sustained many injuries before its final removal. The most remarkable alterations were the removal of the drawbridge and the clearing away of the houses and other buildings; the last alteration took place A.D. 1756. The bridge itself was taken down in 1831 after the opening of the present London Bridge.

Vitruvius.

The history of Vitruvius is known only by what he casually says of himself in his treatise. He is noticed only by two ancient writers—by Pliny, who enumerates him among the writers from whose works he compiled, and by Frontinus, in his treatise on aqueducts, "De Aquæductibus," who mentions him as the inventor of the Quinarian measure. Neither the time nor the place of his birth is known, but he is generally supposed to have been born at Formiæ (Mola di Gaëta), in Campania, from several inscriptions relating to the Vitruvia family which have been found there. As he dedicated his work to the Emperor Augustus when he was already old, and as it was written before the theatres of Marcellus and Balbus were built, which was in the year 13 B.C. (for when Vitruvius wrote the theatre of Pompey was the only stone theatre in Rome), it follows that he must have been born about 80 B.C., or a little earlier. From what he says in the prefaces to his third and sixth books, it would seem that he was not very successful in his profession; he executed only one public work that is mentioned, a basilica at Fanum. He was, however, at the time that he wrote one of the superintendents of the engines of war, the others being Marcus Aurelius, P. Numisius and Cn. Cornelius, a place which he had obtained through the recommendation of the emperor's sister, and it was on account of this appointment, as he himself says, that he dedicated his work to the emperor. He states that he had received a good education, and was fond of literary and philosophic subjects, that riches were no object with him, and that he was possessed of very little, but that he hoped to acquire a reputation with posterity for the treatise he was then writing. He mentions, in the preface to his seventh book, the architectural writers to whom he was chiefly indebted for information, namely, Agatharcus, Democritus and Anaxagoras, Silenus, Theodorus, Ctesiphon and Metagenes, Phileos, Ictinus and Carpius, Theodorus Phocæus, Philo, Hermogenes, Argelias and Satyrus and Phyteus. He mentions also many other writers who wrote upon subjects more or less bearing upon architecture.

NOTES AND COMMENTS.

OF late the Society for Promoting Christian Knowledge has taken interest in architecture, and some useful books have been compiled with the aid of the illustrations which appeared in the Society's periodicals. In the small book entitled "The Old Churches of our Land," by Mr. F. BALDWIN, nearly all the illustrations are original. They are not as pictorial as those in the volumes we have mentioned, but they serve the purpose for which they were intended, viz. the interpretation of the text. When it is remembered how indifferent the majority of English people are to all things architectural, it is not easy to produce a book on the art which will compel ordinary readers to go through the pages with attention. Mr. BALDWIN offers his book to those who are in search of a hobby. It is difficult to judge of the needs of lay readers, but we imagine the pages will not be considered as unattractive by them. The author is careful to suggest how the growth or transformation of Gothic during the various periods was brought about, but he does not weary the reader by dwelling too long on dates or measurements. The book will enable congregations to realise that numerous village churches can always express the main points of their history although the parish records have vanished. Professional students will demand more from a history of the art, but if all churchgoers were acquainted with the contents of Mr. BALDWIN's volume it would be an advantage for those who practise the art.

THE anachronism of SHAKESPEARE in making THESEUS a "Duke of Athens," and of BEAUMONT and FLETCHER when they conferred a similar title on their noble SOPHOCLES, has been often discussed. It is remarkable to find M. SARDOU, in his new "Gismonda," has not only imitated their example, but justifies his conduct on logical grounds. People, he says, have imagined that the duchy of Athens was only a Shakespearean creation, whereas it lasted for two centuries, and was a scene of most dramatic vicissitudes. It was a fief of France, and the first duke, OTHON DE LA ROCHE, was from Franche Comté. Like THESEUS in the "Midsummer Night's Dream," the nobles of Burgundy, Flanders, Italy, &c., who were stationed in Athens, did not attempt to pose as citizens of the Periclean Age. They rather recreated the past according to their own image. ULYSSES they regarded as a Crusader, who with other brave barons had left his home to combat the Saracens of Troy who were ruled by PRIAM the Sultan, and in order to rescue the Princess HELENA. They built castles on the model of Coucy, Monthléry, Clisson or Pierrefonds, and surrounded themselves with falconers, esquires, chaplains and minstrels. But M. SARDOU maintains that both Frenchmen and Florentines respected the ancient architecture, and accordingly in his drama he has given a restoration of Athens in its best days. The Acropolis, with the Parthenon, Erechtheum, Pinacotheca, Propylæa, do not appear as they are now visible. There are also the Temple of Daphne on the road to Eleusis, and the ruins of another temple which stood on the Hill of the Nymphs. No trace remains of the latter or of the basilica erected by the Crusaders within the Erechtheum, where the final scene is enacted, but the Roman and other basilicas have enabled the artists to create it. M. MOYAUX, the architect, who has studied in Athens, has been most zealous in supplying sketches and giving information for the buildings. The scenery may not have the novelty that belongs to "Salammbô," for Athens has fortunately escaped the fate of Carthage, still it is novel to see the noble buildings on the Acropolis serving as a background for figures in fifteenth-century costumes.

THE exhibition of the Institute of Painters in Oil Colours contains 600 examples. Several of the members are absentees, and those who have contributed do not monopolise a large amount of wall-space. The Institute, in its moderation, sets an example which few societies care to imitate. Views of buildings are numerous. Mr. PILLEAU has two Venetian scenes and one from the Island of Elephantine, Nubia, which denote patient labour. Mr.

OSBORNE'S *Fishmarket, Galway*, will disappoint those who imagine that the town has Spanish characteristics, but it appears to be as correct as the artist's more familiar scene in Amsterdam. Mr. FULLEYLOVE has increased his English series by *Ely Cathedral from the Marshes*, and he seems to have caught more of the *genus loci* than in the views from Venice and Rome. Mr. F. DILLON has two Egyptian scenes boldly handled. Mr. W. MAY shows *The Old Water Gate, Bruges*, but he might easily have found a more suitable subject in the city. Mr. GRAHAM PETRIE'S *S. Giorgio Maggiore* is interesting as a fresh interpretation of a building on which many artists have tested their power. Mr. HARRY HINE'S *St. Albans* is a record of pre-restoration days. *The Tower Bridge*, by Mr. F. H. MICHAEL, is, we believe, the first representation of the structure in oils, and the Corporation should secure it. A picture of the kind is useful as suggesting that Londoners need not go far in search of the picturesque. Mr. COTMAN'S *Steaming into Lincoln* only indicates the cathedral, but what he gives is sufficient to suggest the difference between past and present, between architecture and engineering. As TURNER painted in rivalry with CLAUDE on one occasion, Mr. COTMAN seems to have emulated TURNER'S railway scene, and of the two we prefer the later work.

THE fresco process of Herr KEIM, in which marble dust is employed among other materials, has obtained the approval of Professor ROBERTS-AUSTEN, of the Royal Mint. He says:—"I have watched each stage of the work, and from the chemical point of view have every reason to believe that this interior decoration will prove to be very enduring. I may add that an alteration which was effected in the roof [of the church at Blackheath-Wonersh] a year ago during inclement weather permitted water to percolate freely through one of the frescoes from the back, and it stood this severe test perfectly." The use of marble dust is almost as old as fresco itself. ALBERTI refers to the three coats which were employed by the Italians, and were known as the *rinzaffato*, or rough coat; the *arriciato*, or sand coat; and the *intonaco*, or fresco ground. For the first he recommends the use of pit sand and pounded bricks, for the second river sand, and for the third pounded white marble. It has been ascertained that the walls of the Baths of Titus in Rome, from which RAPHAEL was supposed to have derived much of his ornament, were coated with coarse sand and lime, lime and pozzolana with sanded and pounded brick, while the surface which was to be painted consisted of lime and pounded marble. GIOVANNI DI UDINE in the Loggia of the Vatican used lime and marble dust, but not finely pulverised, for his third coat. When fresco was revived in Munich the only lime employed was made out of marble pebbles carried down by the river Isar from the Bavarian Alps. In KEIM'S process, while the ground consists mainly of marble dust, lime is eliminated almost entirely from the under coatings.

THE competitors who are to take part in the contest for the prizes founded by Madame CHENAVARD, for students of the Ecole des Beaux-Arts, have been selected by the Council. This is the second year in which that lady's bounty will be utilised. Eight painters, eight sculptors, five architects, a medallist and an engraver are to take part in the struggle. They are allowed five and a half months to prepare their works. Each of them will receive an indemnity, the painters and architects 1,500 francs, the sculptors 2,000 francs, and the engravers 1,250 francs. The prizes will probably be 1,400 francs for the best work and 600 francs for the second work in each of the sections. The amount distributed in that way will amount to 46,000 francs. The revenue that is derived from the property amounts to 68,000 francs. The balance will be partly employed in special prizes and partly in donations to necessitous students. Madame CHENAVARD, whose liberality is likely to aid in advancing French art, was the widow of an amateur. The fortune she acquired was bequeathed to the Ecole des Beaux-Arts, an arrangement which was not agreeable to her relations.

The Architect, Nov. 2nd 1894.

ARNCLIFFE, HEADINGLEY.
HALL, ARNCLIFFE, HEADINGLEY.

ON July 27 we published a view and description of this house. The name has, however, been changed from Shireoak to Arncliffe. The view of the hall shows the plaster frieze modelled by Messrs. TARBOLTON & TUGWELL.

ENTRANCE, MARYLAND HOUSE, HEADINGLEY.

DINING-ROOM, MARYLAND HOUSE, HEADINGLEY.

DRAWING-ROOM CHIMNEYPIECE, MARYLAND HOUSE, HEADINGLEY.

BILLIARD-ROOM CHIMNEYPIECE, MARYLAND HOUSE, HEADINGLEY.

Both houses have been designed by Mr. F. W. BEDFORD, architect, Leeds, and the work carried out under his superintendence.

In connection with our illustration of the Queen's Hall, Langham Place (*The Architect*, October 26), we are pleased to state that the whole of the sculpture, carvings, &c., have been excellently executed by Messrs. Sidney W. Elmes & Son, of South Kensington.

On the plan which was published in connection with Mr. Figgis's design for the Northern Polytechnic Institute, a line appears which might be taken for a division of space. It simply marks the junction-lines of the sheets on which the plans were drawn.

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting of the Association was held on Friday evening, when the president, Mr. E. W. Mountford, after distributing the medals and prizes to the successful students for the last session, and having also presented the silver and bronze medals to the prize winners of the two previous sessions, delivered his inaugural address.

Medals and Prizes.

The principal prize-winners of the past session were:—Architectural Association medal, with prize of the value of ten guineas, G. Lucas; measured drawings prize, J. Allen; essay prize, value ten guineas and silver medal, subject, "The history and development of timber roofs in England during the fifteenth and sixteenth centuries," C. de Gruchy; Cates Scholarship, tenable for two years, John Hunt; travelling studentship, bronze medal, C. C. Brewer; Oliver prize, T. F. Green.

Lecture Side.—Division I.—S. L. Crosbie, silver medal; P. J. Groom, bronze medal. Division II.—S. Perkins, silver medal; T. E. Abbott, bronze medal. Division III.—C. de Gruchy, silver medal; J. R. Stark, bronze medal. Division IV.—J. P. Clark, silver medal; A. J. Stratton, bronze medal.

Studio Side.—Division I.—P. J. Groom and H. W. Tomes, certificates. Division II.—T. F. Green, silver medal and certificate; H. C. Trimmell, bronze medal and certificate. Division III.—A. C. Dickie, silver medal and certificate; A. Wood, bronze medal and certificate. Division IV.—J. P. Clark, silver medal and certificate; M. G. Pechell, bronze medal and certificate.

President's Address.

THE PRESIDENT in the course of his address said:—My best thanks are due to you for the great honour conferred upon me by my re-election. It is pleasant to be sure of receiving warm support from not only the officers and committee but from the Association as a body, whenever such support is required. I am very grateful that it is so, and desire to thank you all, and especially the hon. secs. and committee, most sincerely for the support so given, without which no president could carry on his duties with any degree of satisfaction. I am exceedingly glad to say that the past session has been a most successful one, perhaps the most successful we have had under the present order of things. The studio and classes generally have been very well attended, excepting in Division IV., and the work done has been distinctly good. In a large majority of the classes the first man has gained more than the 80 per cent. of the maximum number of marks necessary to qualify him for a book prize in addition to his certificate, while in several cases he has obtained the full number allotted to the subject. This is very gratifying, as is also the fact that of the ninety-six new members who joined our ranks during last session, no less than seventy-three joined either the classes or studio, and that there were seventy-eight students who took up complete courses of lectures and classes, forty of them being in Division I., twenty-five in Division II. and ten in Division III.

As regards those who are really making use of our educational course as we wish it to be used, and who alone can obtain the full benefit of it, you will be interested to know that of the students who worked in Division I. in session 1892-93, fourteen moved into Division II. in session 1893-94, while seven moved from Division II. into Division III. and two from Division III. into Division IV. It was my hope that more students would have seen the advantage of this gradual and sustained progress from one division to another; but this is an improvement upon last year, and we trust the improvement may increase, for only so can the best results be obtained.

The continued want of appreciation of Division IV. has been very fully considered and discussed by the committee, with the result that it has been temporarily abandoned, the subjects hitherto contained therein being either treated as extra subjects or room found for them in other divisions. It is proposed to re-establish it at the first opportunity.

There is improvement also in the competition for our prizes. Six designs were submitted for the Architectural Association medal, while Mr. Brewer carried off the Travelling Studentship with a set of drawings of unusual merit, and although only one entered for the Essay Prize (Mr. de Gruchy), the sub-committee reports that his production is most meritorious and well deserves the prize. The Architectural Union Company's prize was not awarded, neither was that offered by Mr. James Brooks. With reference to this last, I am under the impression that the subject—one bay of the vaulting of the cathedral at Oxford—was somewhat too difficult, necessitating, as it did, the use of scaffolding and ladders, as well as residence in Oxford. Mr. Brooks has, however, kindly allowed me to set the subject for the coming year, and intending competitors, of whom I hope there will be many, will find it not only interesting, but easily accessible with ordinary appliances and within easy reach of London, so that a few summer Saturday afternoons will be sufficient for the work.

I would again strongly impress upon all our students the great advantage to be derived from competing for the various prizes, intelligent study of existing work being of all things the most essential to the success of an architect, and may I remind them of the importance of studying the construction and indicating the joints of wood and stonework carefully and correctly upon their drawings? It would please me very much to see the number of competitors for each prize largely increased.

One cause of complaint which I made last year you have removed entirely. The attendances at our fortnightly Ordinary Meetings have been very good, the discussions frequently quite animated, and this has afforded me much pleasure. My thanks are specially due to the members of the Discussion Section for their valuable assistance in the matter, and to the various gentlemen who read the exceedingly interesting papers which, doubtless, were in a great measure the cause of the improved attendance. If you examine the Brown Book you will see in the syllabus of meetings that our papers for this session are, if possible, of even greater interest than those of last, and it is to be hoped you will show your appreciation of this fact by attending in even greater numbers. You will find papers on subjects purely artistic and subjects which are more particularly practical; amongst others, we have provided for your delectation one in which "Specifications" are treated of from two points of view—the builder's and the architect's. The names of Messrs. Walter Crane, Statham and Pite, Stirling Lee, John Beicher and Pomeroy, are sufficient guarantee of the quality of the material prepared for you. Might I suggest that you should look up the various subjects mentioned in the Brown Book before the meetings, and come prepared, not only to ask questions, but to afford information.

One of our most popular lecturers has gone from amongst us during the last few days. John Loftus Robinson, hon. amateur photographer to the Architectural Association, died on the 12th of this month of typhoid fever. For those who knew him well it is difficult to realise that we shall see him no more in this world, never more hear his infectious laugh; for of all men he seemed to have a superabundance of life, health and good spirits. On the annual excursion he will be immensely missed, for his never-failing flow of amusing stories and the enthusiastic manner in which he threw himself into every kind of fun, helped largely to make the excursions the great success they have been. His photographic records of each visit were most valuable and he always exhibited the greatest energy and industry in making them. He was the first president of our Camera Club. To all here he was known by his amusing lectures, containing most interesting and valuable descriptions of the parts of England visited by the Association, superbly illustrated as they were by views produced from his own photographs. It will be impossible to fill up the blank his premature death has caused and very long before his memory is forgotten!

We have also to regret the recent decease of Mr. Wyatt Papworth. He was always a good friend to the Architectural Association and to his kind offices we are indebted for the generous donation of 50% from the Clothworkers' Company to our general fund.

During last session the Association was actively employed in the consideration of the new Building Act for London, for which purpose a special sub-committee was formed and held frequent meetings. We entered an appearance against it before the committee of the House of Commons and made a determined effort to obtain the abolition of the clauses respecting parapets to party walls, so far as relates to dwelling-houses. In this work our past, vice-president, Mr. Caröe, took a very active part and spared neither time nor money to achieve our ends. In the opinion of most impartial observers he fully proved his contention that there is no necessity for carrying party walls above the roofs of ordinary dwelling-houses, but with the present and late heads of the Fire Brigade against him we failed to carry the point. This is much to be regretted; for all of us, especially those who live in the suburbs or daily traverse them in the train, must know how extremely unsightly they are in small houses and what constant sources of expense and damage to their interiors. Although we failed in this point we were more successful in others, and we may at least congratulate ourselves that the new Act is a great improvement upon its predecessors and removes many irritating restrictions under which architects suffered.

Very much time and consideration have been given by both the committee and a special sub-committee to the scheme originated by Mr. Owen Fleming for the better technical education of London workmen employed in the building trades. Our communications on the subject with the various City Companies, the trades unions and other bodies have received general approval, and with your consent a preliminary conference will shortly be held, at which all the above-mentioned bodies will be represented. When the subject was first broached the paper *London* was good enough to criticise our action with a good deal of disfavour, but as it was evident that it entirely misunderstood our intentions, no one troubled to reply. They seemed to think it was an endeavour upon the part of architects, whom they were good enough to call a "most notoriously ill-educated profession," to patronise the workmen, and advised us to look to ourselves first. Well, no one can say that the Association has neglected the education of architects. That has been our great object for over fifty years, and for a good many years past we have been fairly successful. Our system is not yet perfect, and probably never will be, but it is as good as we know how to make it for the present, and we shall endeavour to improve it still more as time goes on. So having done our best for ourselves, we naturally desired to help the workmen with whose co-operation we are beautifying more or less, according to our abilities, the face of Great Britain. We have no desire to patronise them (why should we?), but merely to treat them as fellow-workmen with a common object. In helping them we are helping ourselves, for beautiful workmanship may go far to redeem a bad design, while a good design may suffer immensely from bad workmanship. The architect is the chief workman, but absolute success in any building can only be obtained by every workman of every trade employed upon it doing his very best, and uniting in a common effort to make the building in all its parts perfectly beautiful and perfectly strong. It is in this spirit that we are approaching the conference, and if, as I believe, the other workmen understand this, we may hope to produce some beneficial results.

In my address last session I ventured to give you some advice upon various matters connected with our art, profession or trade, and the different methods of practising it. I have no desire to detract or alter anything then said, but there are one or two points upon which perhaps you will allow me to say a little more.

It is within my recollection that I advised young architects, by which I mean very young architects, for all architects under sixty are young, to take any work that may chance to come their way, so long as it be honest and at all remunerative, whether it be "light-and-air" cases, "dilapidations," sanitary work, or any other lowly undertaking. As a fact, these things pay very much better than more pleasant and artistic work, as may be easily seen by comparing the incomes earned by the lordly surveyor with those made by the mere architect, and the palace inhabited by the former with the humble home of the latter. I also ventured to advise the aforesaid very young architect to pay no heed to the discussions as to whether his calling be a trade, a profession or an art, but to simply do his level best in whatever work he undertook.

But now I want to remind him that although the surveying work referred to is by no means to be despised, and is indeed very profitable, that it is only to be regarded by him as a means to an end, and that, let it be called what it may, architecture not only is an art, but the greatest amongst arts. It happens that it is not what may be called a popular art, and it neither obtains honours, nor indeed any recognition from royalty or the other powers that be, nor does it command the same remuneration from the British public that the arts of painting and sculpture do. But this, considered in the right light, may possibly be an advantage.

A well-known ecclesiastical writer has put it on record that "the love of money is the root of all evil," and this is most true so far as it relates to art; indeed it might be said that "the love of money is death to all art." Now, a successful painter is very soon in receipt of a large income, is invited into society and in consequence becomes an R.A., and more or less of what is vulgarly called a "social swell." Then comes the end, so far as his art is concerned, for to keep up his newly acquired position he paints not what he knows to be good, nor the best that is in him, but what he knows will sell, pot-boilers in fact, or supplements for the Christmas numbers of the illustrated papers, and so keeping his position he probably degrades his art. Now we are not, at least not yet, beset with these temptations. The public does not run after architects and compete for the honour of employing them. It would never occur to the vast majority of them that architecture is an art, although we may gratefully admit that the number of the intelligent few who do so regard it is on the increase. Very few indeed know a good building from a bad one, and they pay us our 5% per cent. commission, equally willingly or unwillingly as the case may be, whether it be for designing a brick warehouse or a church full of elaborate detail. The very method of payment is obviously against our acknowledgment as artists by the public; they are more likely to class us with auctioneers, house agents, brokers and other individuals paid by commission in a like manner. No, when the great British public speak of an artist they mean a painter, or possibly a photographer, but certainly some one who makes pictures that can be put in gold frames (made in Germany), and hung upon the wall. To them picture-making is art and pictures appeal to them because they can, if the story told by the pictures be sufficiently clear, understand them, and then they buy them and the manufacturers wax exceeding rich. But very few, comparatively, of the public care about or understand sculpture and still fewer architecture, which is quite sufficient proof that of the three arts, architecture is the greatest, sculpture the next and painting last. But the public reverse the order and pay accordingly.

If you consider the work of an architect you will see how responsible it is, and how careful we ought to be to carry out to the very best of our ability all that is entrusted to us. Our work is necessarily conspicuous, and its influence, for good or evil, correspondingly greater than that of a picture or statue hidden away in some gallery or church. Statues and pictures must generally be the property and delight of the more or less rich; our work is for all, from the richest to the poorest. Upon it depends in a great measure the appearance and even the health of our towns, and foreigners form their opinion of the country largely from the beauty or otherwise of the buildings.

Our own motto, "Design with Beauty, Build in Truth," fairly expresses the whole duty of an architect, and happy is he who can do it. The question of what constitutes the beautiful in architecture is more than difficult to answer. There is beauty of form, mass and outline, beauty of colour and material, beauty of detail. Failure in any one of these mars the building, and but few men can hope to attain all.

As regards beauty of outline, it would seem that a change is taking place in our ideas. Not so long ago picturesqueness was the great aim of most architects, and I well remember the mayoress of a considerable provincial town seriously informing me that a leading builder of the town (naturally an authority on the subject) had imparted to her the one way to make a building pretty, which was simply to "cut up the roof as much as possible and use plenty of iron cresting." This opinion was once, no doubt, more or less generally acted upon, but lately men have learnt once more that long unbroken lines and large masses of roof and wall impart a dignity and repose to buildings not to be obtained in any other way. Unnecessary breaks in the roof of a building are to be specially avoided, for they are expensive, constant sources of danger from rain and snow, and being meaningless, are certain to offend the educated eye.

In the matter of colour one is the less likely to go wrong, probably, because the opportunities for doing so are more limited; moreover, in this respect time is good to us, excepting in very smoky towns. In London there can be no happier combination than red brick, Portland stone and Westmorland slates for the exterior buildings, and indeed they would be fairly safe anywhere, but there are many other building stones of great beauty of colour, and both tiles, shingles and lead have good claims to consideration as beautiful roof coverings. On this head I may well refer you to the valuable paper on "Colour in London Architecture," read here by Mr. Beale during last session.

Of the various beautiful colour effects to be obtained internally by the use of marbles, alabaster and glass, it is impossible to speak here. I would simply say, avoid violent contrasts, do not dot slender shafts of dark marble about an otherwise almost white interior, as one not unfrequently sees done in modern churches, and make all the use you can of British materials. Probably a good many people are unaware

of the wealth of red, green and grey marbles to be obtained in our own islands.

Beauty of detail is, perhaps, the most difficult of all to obtain; certainly nothing more marks the distinction between good and bad architecture than the quality of its detail. The tendency of modern times has been to overload buildings with ornament of all kinds, many important buildings having been thereby spoiled. "When in doubt, turn on the carver" seems to be the principle on which many architects work, and no more fatal mistake can be made. Simplicity and breadth are the great things to strive after, and nothing more helps the appearance of a building than abundance of absolutely plain wall surface. What is more beautiful than the effect of sunlight upon a large mass of unbroken wall, where the ever-varying tints of good brick or stone have a chance of displaying themselves? Have carving by all means, but see that it is the best obtainable, and then probably the cost of it will prevent your having too much. Concentrate it, too, in masses and do not spot it all about your elevations; then its richness gives value to the plain wall surfaces which by contrast add to the effect of the carving. It is a good plan when you think you have finished your elevations to go carefully over them again and see what features you can omit, and as you grow older you will probably find that more and more can with advantage be omitted. It is quite possible to design a noble building which shall be entirely free of any (so-called) ornament whatever and owe the whole of its beauty to fine proportion and materials.

To "build in truth" is simpler and, requiring but good common sense, is within the reach of us all. As I understand this part of our motto, it means simply that we should use each material in the proper and appropriate manner. It is not building in truth, for instance, when one designs what professes to be a half timber building and executes the timber in cement, as a good many architects have done. This may be artful, but it is not art, in fact it is merely a poor fraud, by no means justified by the fact that our London and many provincial building regulations bar the use of timber in this manner. A very pleasing front can be made of stucco, used as stucco, as Mr. Colcutt has shown us at the other end of Fleet Street. The use of cast-iron to imitate wrought-iron is another common fraud and one that is quite unnecessary, because cast-iron used in the proper way can be perfectly satisfactory and beautiful, as may constantly be seen in old work. Indeed, effects can be legitimately obtained with cast-iron that it would be difficult or at least extremely costly to get in wrought.

It only remains, therefore, to consider how best a young man may learn to design with beauty, because this is the one great business of an architect. The only way to learn how to design is by the constant study of existing work. I say existing work advisedly, because it is my belief that the study of modern work is as necessary, and more useful, perhaps, than that of old work. Of course he must study old work, but by all means study modern buildings as well. The old men undoubtedly acted upon this principle; they saw what had last been done, and then proceeded to make some improvement upon it, and if we work upon these lines architecture will become more and more a living art. It is my very strong belief that there are amongst us now men capable of doing work better than any done here in the Middle Ages; indeed I often doubt whether we should so much admire some of our famous old work if we could see it "white from the mason's hand." Take the west fronts of Salisbury and Wells Cathedrals, for instance, two of the most admired productions of the Middle Ages. Worn by the hand of time, beaten by the winds, washed by the rains and baked by the sun of centuries, saturated with religious sentiment and surrounded by the glamour of romance, they are most beautiful, and their contemplation fills one with delight. But if they could be done by a modern architect, and stand before us brand new, with all their mouldings clear and sharp, and their every detail as it left the masons' hands, I do not hesitate to say they would receive very much unfavourable criticism from our shining lights. Therefore, I repeat, study old work, but do not fail to study new. There is something to be learned from it all, and though a great deal may be useful only in showing us what to avoid, there is much, very much, that is well worthy of our admiration. Take Mr. Norman Shaw's New Scotland Yard, for instance, and see how that fulfils every requirement as to simplicity, breadth, proportion and colour. Look at the ecclesiastical work of Messrs. Gilbert Scott, Bentley, Bodley and Pearson. Note especially how the latter obtains beautiful results, sometimes with scarcely any ornament and no sculpture. On the other hand, look at the works of Sedding, and see how full they are of charming detail. I could go on with the list, for there are plenty more men, and young men too, capable of admirable work, but I leave you to finish it for yourselves; believing myself in modern work, I want you to do the same.

But whether studying old or really good new buildings, remember that you are not to think that by reproducing certain details of them you are doing the right thing. It is the spirit you have to strive after, the life that is in them, the evident

enthusiasm and love for the work which they all show so plainly.

Last year, in making some reference to the examinations held by the R.I.B.A., I said that it seemed to me that at least they could do no harm, so long as they are regarded merely as the means to an end and not the end itself. Whatever you do, do not get the idea into your heads that the object of your work here is to pass these examinations, more or less creditably. The preparation will do you much good, and the subjects you have to get up are those with which all architects should be acquainted. But remember the knowledge so gained is absolutely the minimum you must have to carry out your work decently. An architect must be a student all his days; no matter how long he lives, there will always be more for him to learn.

Last year also you were good enough to approve by your smiles some remarks I made upon two other subjects, competitions and ghosts. Now, for a man to send in as his own design the work of another, everyone must admit to be a downright fraud, and the man so acting ought to be punished by immediate disqualification. It is a matter that the Institute should take up strongly for the credit of the profession, as nothing can be more damaging to us as a body than the knowledge that this sort of thing is done. The ghosts themselves are by no means free from blame, but I am not prepared to sit in judgment upon them. They do their work honestly, for a more or less nominal sum; but their employers, who do not do the work, and could not do it, take all the credit and all the profit.

A vote of thanks, proposed by Mr. Seth Smith, seconded by Mr. Aston Webb and supported by Mr. Leonard Stokes, was passed by acclamation to the President.

STONEHENGE.

IN *The Architect* of last week an interesting essay by Dr. MacGregor on the dolmens and menhirs of Carnac was published. His conclusion was that "these mile long alleys of colossal menhirs were not merely lines of tombs; they were avenues that led to and ended in cromlechs, and the cromlechs of Carnac, like that of Stonehenge, were temples for the worship of an unknown god, and probably contained altars of sacrifice." That theory represents the latest results of inquiry. It may be well to contrast the early speculations on the subject *apropos* of Stonehenge. They are contained in the following article by the late John Britton, whose name is associated with the history of Gothic architecture in England:—

Stonehenge, with the far-famed pyramids of Egypt and other works of the same class, may be considered as the oldest monuments of man's labour. Being anterior to all written evidence, their history is entirely unknown, and they have been the subjects of much unprofitable speculation, some of which however will require a short notice.

Stonehenge is situated about two miles due west of the town of Amesbury and seven north of Salisbury, in Wiltshire. From its singular character and peculiar situation, which is easy of access, it has attracted more attention than any other relic of antiquity in Great Britain. Viewed at a distance it appears a trifling object; for its real magnitude appears diminished in the extensive plain or open country which surrounds it, and even on a near examination it often fails to satisfy expectation.

In various parts of the world there are circles of upright stones, some of which consist of a single circle and others of many circles; but Stonehenge is of a peculiar character, and is, we believe, wholly unlike any other ancient monument. Many of the stones have been squared or hewn by art, and the horizontal stones of the outer circle are carefully attached by mortises to the uprights, which have tenons; whereas nearly all other examples of what are generally called Druidical circles are composed of rough unhewn upright stones without imposts.

The stones are surrounded by a circular vallum, or bank of earth, within a ditch or foss. Within this bank are three stones, two of which are in an upright position and the other is prostrate. It has been conjectured by Browne, with some probability, that these originally formed part of a circle. In the centre of the enclosed space is what is usually called the temple itself, which comprised originally an outer circle of thirty upright stones, at nearly equal distances apart, sustaining as many stones in a horizontal position, forming a continuous impost. Each of the upright stones had two tenons or projections on the top, which were adapted to fit into and fill up two mortises or hollows in each superincumbent slab. Within this was another, or second circle, consisting of about the same number of perpendicular stones, of much smaller size and without imposts. This circle enclosed an elliptical arrangement of large and small stones; the former, which were divided into groups of three stones each, are called trilithons by Dr. Stukeley and subsequent writers. There were five trilithons,

each of which consisted of two upright stones and an impost, covering or extending to the extreme edges of the standing stones. Before each trilithon stood three small upright stones, and in the central space, or adytum, of the temple (in front of the principal trilithon) was a large flat stone, called the altar.

The dimensions of the stones and the space occupied by the structure, as nearly as they have been ascertained, are:—Diameter of the space enclosed within the vallum or bank, 300 feet; height of vallum, 15 feet; diameter of the outer circle, 100 feet; diameter of the second circle, 83 feet; height of the stones of outer circle, 14 (sides 7 feet by 3); height of trilithons, 16 feet 3 inches, 17 feet 2 inches, 21 feet 6 inches; height of one of the small stones before the same, 7 feet 6 inches.

The stones of the outer circle, the trilithons, the stones in the avenue and adjoining the vallum are, according to Dr. Townson, in "Tracts and Observations on Natural History, &c.," "a pure, fine-grained, compact sandstone, differing only a little in their colour, some being white and others inclining to yellow." They precisely resemble the grey-wethers and numerous other detached masses which lie on the surface of the downs in the vicinity of Avebury and Marlborough. The stones of the second circle and the row within the trilithons consist of "a fine-grained grüstein," interspersed with black hornblende, felspar, quartz and chlorite, excepting four in the circle, one of which is a siliceous schist, another is an argillaceous schist, and the others are hornstone, with small specks of felspar and pyrites. The slab or altar-stone is different from all these, being a kind of "grey cos, a very fine-grained calcareous sandstone," which strikes fire with steel, and contains some minute spangles of silver mica.

The surrounding plain is covered with a profusion of barrows and earthworks, perhaps unparalleled in any spot of similar extent in England and probably in the world. Many of the barrows were opened by Sir Richard Hoare and his indefatigable coadjutor, Mr. Cunnington, and were found to contain in some instances cists or chests filled with burnt bones, and in others entire skeletons, with various relics of British and Roman art. Some other objects besides the barrows demand our notice. The principal of these are the avenue and the cursus. The former is a narrow strip of raised ground, bounded on each side by a slight bank of earth, and extending in a straight line from the entrance, through the vallum of the structure on the north-east, to the distance of 594 yards, at which spot it divides into two branches, one of which continues southward and is seen between two rows of barrows, while the other proceeds northward and approaches within a few yards of the cursus. The cursus is a very curious and interesting appendage to Stonehenge, if it can be properly so considered. It is a flat tract of land, bounded by two parallel banks and ditches, and is situated about half a mile north-east of Stonehenge; it measures one mile five furlongs and 176 yards in length and 110 yards in breadth. Its direction is from east to west, and at the former extremity is a mound of earth resembling a long barrow, which stretches entirely across it. The western extremity is destitute of any mound like that at the eastern end, but there are two barrows irregularly placed near this end within the area of the cursus, a part of which appears also to be cut off by a slight bank. The original purpose of this bank is difficult to determine, for we can scarcely suppose that if the chariots started from the east end, they would be driven over this bank, to the termination of the course at this end. We should therefore be inclined to think that it had been raised at a later period, for some object distinct from racing, if there were not another similar bank thrown across a second and smaller cursus, which is situated at the distance of nearly a mile from the larger one. From the near resemblance of the above work to the genuine circus of the Romans, it is reasonable to suppose that, if not formed by the Romans, it was made in imitation of their chariot course, and by a people familiar with their manners and customs. Hoare's "Antient Wiltshire" contains a very interesting map, showing the surface of the plain around Stonehenge to the extent of about five miles from east to west by three miles from north to south. Within that area are two large encampments, two cursuses, other embankments supposed to mark British villages, and at least 300 barrows or tumuli of various sizes and shapes. Hence it may be reasonably inferred that Stonehenge was a place of great importance in former ages.

The earliest published notice of Stonehenge occurs in the writings of Nennius, who lived in the ninth century. He narrates the particulars of the murder of 460 British nobles at a conference between King Vortigern and Hengist in the latter part of the fifth century, at or near the spot on which Stonehenge is situated, and attributes the erection of the monument to the surviving Britons, who thus endeavoured to perpetuate the memory of that tragical event.

The historical "Triads of the Welsh Bards" refer its origin to the same cause, and relate that it was constructed by Merlin after the death of King Vortigern. This likewise is

the account of Walter Mapes, who is very circumstantial in his narrative.

Geoffroy of Monmouth, who wrote in the twelfth century, gives a similar account of its origin, with the addition of a legend which is repeated by most subsequent writers. He states that Merlin employed supernatural agency to remove the stones from Kildare in Ireland and place them upright on Salisbury Plain, and he adds that they had been in the first instance conveyed to Ireland from Africa. The same story appears in Giraldus Cambrensis (1187), who mentions a similar monument which he had seen on the plains of Kildare.

Henry of Huntingdon, who also wrote in the twelfth century, discredits the story of Merlin, and says that no one can devise by what means or for what purpose such a work could have been raised. Neither Gildas, Bede, William of Malmesbury, Hovedon, Ingulphus, Matthew Paris nor Florence of Worcester have any notice of this remarkable monument, a circumstance which Henry of Huntingdon attributes to their inability to give any account of its origin or use.

Polydore Virgil (1534) says that it was raised by the Britons to the memory of Aurelius Ambrosius. Camden, who wrote in 1586, gives no opinion on its origin or purpose. His description and representation are so very erroneous that it is doubtful if he ever visited the place. John Aubrey, in a manuscript referred to by Bishop Gibson and Sir Richard Hoare, attributes its origin to the Britons prior to the Roman invasion.

Such is the scanty information which our old writers contain about this curious monument of ancient times. Modern writers on Stonehenge, rejecting all historical evidence, have raised their theories on purely speculative foundations. Inigo Jones, in his essay on Stonehenge, undertaken at the desire of King James I., and which was published in one small folio volume by his son-in-law, John Webb, A.D. 1655, endeavours to show that Stonehenge was a temple of the Romans of the Tuscan order, dedicated to Cælus; but he has committed palpable errors in his restorations, to say nothing of the absurdity of his general assertion.

The next essay was written about 1660, and published anonymously in Langtoft's "Chronicle," called "A Fool's Bolt soon Shot at Stonage." The writer considers it to have been a British temple, commemorative of a victory gained by the Cangi of Somersetshire over King Divitiacus and his Belgæ. In 1663 Dr. Charleton published his "Reflections on Stonehenge," in which he contends that it was erected by the Danes, in the time of King Alfred, as a place for the crowning of their kings. Charleton's "Reflections" called forth an essay of 228 folio pages in support of Inigo Jones by his editor John Webb, published in 1664; this essay is of no value. In 1676 appeared a volume by Aylett Sammes, who remarks, "Why may not these giants (alluding to the title of *Chorea Gigantum* given to this monument) be the Phœnicians; and the art of erecting these stones, instead of the stones themselves, brought from the furthestmost parts of Africa, the known habitations of the Phœnicians?" To this sage question one may answer, why may not the stones have come from the moon and dropped down in their present position?

Bishop Gibson, in his edition of Camden's "Britannia," 1694, after opposing the theories of Jones and Charleton, concludes, "One need make no scruple to affirm that Stonehenge is a British monument, since it does not appear that any other nation had so much footing in this kingdom as to be authors of such a rude and yet magnificent pile." The bishop thinks that some part of this temple may have been erected subsequently to the Roman invasion; a conclusion which seems to be very probable. With reference to its modern name, Gibson refers to a Saxon manuscript of good authority, printed by Dugdale in the "Monasticon," in which it is called Stanhengist, proving its traditional connection, at an early period, with Hengist. In 1720 J. G. Keysler, a learned German antiquary, published at Hanover "An Explication of the Anglo-Saxon Monument of Antiquity on Salisbury Plain, called Stonehenge."

In 1740 Dr. Stukeley published a folio volume entitled "Stonehenge, a Temple restored to the British Druids;" he attributes the work to the British Druids. The plates which accompany his volume are good, and Stukeley's restorations are valuable, but a large portion of his essay is occupied with fanciful and irrelevant speculation.

J. Wood, an architect of Bath, published a series of elaborate plans of this structure, in 8vo, 1747. It is his opinion that it was a temple erected by the British Druids about 100 years before the Christian era.

The Rev. W. Cooke, in a treatise entitled "An Enquiry into the Patriarchal and Druidical Religion, Temples, &c.," 1755, supposes Stonehenge to have been held sacred by the Druids and appropriated to the meetings of great assemblies, on civil as well as religious occasions, for which, he adds, "the world does not afford a nobler spot."

Dr. Smith's work on Stonehenge, called "Choir Gaur," 1771, gives a minute description of the structure, with a notice of most of the theories to which we have referred. He considers

it to have been of Druidical origin, and that it was a "great orrery," erected as well for the purposes of astronomical observation as for religious ceremonials.

Edward King, in his "Munimenta Antiqua," devotes much space and applies much learning to the consideration of ancient stone monuments. He conjectures that Stonehenge was constructed in the latest ages of Druidism, when that religion was struggling against Christianity.

Davies, the learned author of "Celtic Researches," 1804, and the "Mythology of the Druids," 1809, has discussed the question respecting the origin and use of Stonehenge perhaps with more research than any previous writer. He supposes that this structure and Silbury Hill are two of the three works alluded to in a Welsh Triad as constituting the greatest labours of the island of Britain, *i.e.* "lifting the stone of Ketti," "building the work of Emrys" and "piling the Mount of the Assemblies." That Stonehenge is really a Druidical structure, the same learned writer remarks, "is evident, from the language in which it was described and the great veneration in which it was held by the primitive bards, those immediate descendants and avowed disciples of the British Druids." It was not exclusively dedicated to the Sun, the Moon, Saturn or any other individual object of superstition; but it was a kind of Pantheon in which all the Arkite and Sabian divinities of British theology were supposed to have been present." As to its date, he remarks that "it was a monument of venerable antiquity in the days of Hengist, and that its peculiar sanctity influenced the selection of the spot for the place of conference between the British and Saxon princes." Mr. Davies further cites a passage in Diodorus Siculus, who quotes Hecateus, describing a round temple in Britain dedicated to Apollo, which he concludes to have been most likely Stonehenge. (Diod. ii. 47.) Sir R. Hoare has entered more fully into this passage ("Antient Wiltshire," i. 155).

The Rev. James Ingram, in his "Inaugural Lecture on the Utility of the Saxon Literature" (1808), considers Stonehenge to have been intended for a heathen burial-place, and the cursus adjoining as the hippodrome on which the goods of the deceased were run for at the time of the burial. This opinion is entitled to some consideration, from the vast number of barrows and other earthworks which abound in this part of the plain.

Mr. Cunnington, in Sir R. C. Hoare's "History of Antient Wiltshire," folio, 1812, observing the difference in quality and size between the stones of the exterior and interior circles, supposes that Stonehenge was erected at different times. He imagines that the larger stones with their imposts constituted the old or original work, and that the small stones of the second circle and those of the inner range were raised at a later time, "as they add nothing to the grandeur of the temple." But this opinion is not warranted by any example among the numerous Druidical circles of Great Britain; on the contrary, it seems more consistent to conclude that the second circle of small rough, unhewn stones, with another circle immediately within the ditch, and some other members now destroyed formed the original or pristine temple, and that the larger hewn stones with imposts were afterwards added. Many arguments might be alleged in support of this opinion, and also to prove that the great circle of upright chiselled stones, with their imposts and the third row of trilithons were posterior to the former, raised by another class of people, and executed at a time when their principles and arts had been considerably changed. At the same time it is conjectured that an avenue of stones was raised, extending from the temple towards the cursus to the north-east, and also that those places for races and other sports were formed at a time when the inhabitants of Britain had intercourse with the Romans.

The "Topographical Account, &c., of Wiltshire," by J. Britton, forming the fifteenth volume of the "Beauties of England and Wales," 1814, contains an accurate description of Stonehenge and of other antiquities in its immediate neighbourhood.

In 1823 H. Browne published "An Illustration of Stonehenge and Abury," in which he endeavoured to show that both of those monuments were antediluvian, and even that the latter was formed under the direction of Adam. He ascribes the present dilapidated condition of Stonehenge to the operation of the general Deluge, "for," he adds, "to suppose it to be the work of any people since the Flood is actually monstrous."

Godfrey Higgins, in a large 4to volume, 1829, entitled "The Celtic Druids; or, an attempt to show that the Druids were the Priests of Oriental Colonies who emigrated from India," has given an elaborate account, with plates, of Stonehenge, but both the plates and the description are from the works of Stukeley, Sir R. C. Hoare and others. His opinion is that Stonehenge "was raised by the Druids, the priests of the nation, who were its sacred architects."

Mr. Waltire gave lectures on Stonehenge, illustrated by models and drawings, and fancifully represented the temple as a place devoted to sacred and mysterious rites, and as forming a planisphere in connection with the surrounding barrows and

other works. Taking up a part of this theory, but allowing a wider latitude to conjecture, the Rev. E. Duke published in the *Salisbury Journal* a long series of essays, in which he endeavours to show that Stonehenge was one of the members or planets of a vast planetarium, representing the solar system and extending over a wide extent of country, "on a meridian thirty-two miles in length."

John Rickman, in the "Archæologia," vol. xxviii. page 399, supposes that "Silbury Hill, the Abury circus, and the avenues of approach to it, were not constructed earlier than the third century of the Christian era, and that the more difficult operations requisite for the formation of Stonehenge may be assigned to the next century, or (to speak with due caution) that this temple was completed before the final departure of the Romans from Britain."

The Rev. Thomas Maurice, in "Indian Antiquities," vol. vi., has a dissertation on Stonehenge, and endeavours to show that the Druidical rites and ceremonies of the West were derived from ancient India, and that this monument or temple must have been erected more than 500 years before the Christian era.

In "Palestine; the Bible History of the Holy Land," 8vo, 1841, by John Kitto, there is a learned essay "On Ancient Monuments of Stone, Druidical Remains," &c., with an elaborate review of this much controverted subject.

In conclusion it may be observed that there appears much less reason for ascribing the erection of Stonehenge to any of the successive conquerors or colonists of Britain, than to its original inhabitants, the Celtic Britons; and if this be admitted it is a probable conjecture that the structure was erected for religious purposes under the direction of the Druids. The practice of commemorating an important event by raising a number of stones is of the greatest antiquity; and there is nothing in the history either of the Romans or the Saxons to lead us to suppose that those nations ever erected temples or monuments like the stone circles of Avebury and Stonehenge.

THE FIRST BOSTON ARCHITECT.

THE lively public interest which has been recently aroused in the disgraceful conspiracy for the destruction of the State House on Beacon Hill, over the defeat of which, for the present at least, it is not too much to say all persons of taste and cultivation in this community are rejoicing, has brought with it, says the *Architectural Review*, a remarkable revival of the fame of Charles Bulfinch, one of the earliest as he was certainly and deservedly one of the most eminent of American architects. A hundred years have gone by since he began his work, bringing enormous changes in the little town which was the chief theatre of his labours—changes which have swept away by far the greater part of the buildings which rose under his hand, and which have lately threatened and still threaten the noblest of them all. But the foundations of his fame were laid too deep and strong to be at the mercy of any material change, and the quality of his work is probably far more adequately appreciated to-day, both among architects and laymen, than it was when he died, just half a century ago.

It may not be quite without profit to turn our thoughts back for a little while to those early days and consider the modest yet distinguished career of the first Boston architect. He was born in 1763, his father, Thomas Bulfinch, being a physician of good standing living in Bowdoin Square. He was sent to Harvard College, where he was graduated with the class of 1781. A place was then found for him in a counting-house, but the occupation proved distasteful to him. The war of the Revolution was not yet ended, and there was little commercial activity in Boston. Bulfinch employed his leisure in reading such architectural books as came in his way—we cannot suppose them to have been very plentiful—and in superintending such repairs and improvements upon the houses of his father and his friends as were needed. At the age of twenty-one he was sent abroad, and travelled for a year or two in England and on the Continent. It was during this period that his bent towards architecture was strengthened and confirmed. He was strongly excited by the great monuments, and is said to have been moved to tears by the grandeur of St. Peter's. He brought home with him a small library of architectural books which he had collected, and pursued his studies at home with renewed ardour, but apparently without much thought of making architecture a profession. There was, indeed, no such profession in the Boston of that day, and probably none in any American city. Boston was then a little town of detached houses, standing in the midst of gardens, with a few public buildings which had been built from the designs of English architects and with a population of about 18,000 inhabitants.

Bulfinch's first work appears to have been the monumental column on Beacon Hill, whose summit, a round, grassy knoll, a little to the north-east of the present State House, and about on a level with the roof of that building, had ever since 1635 been

marked by a beacon, consisting of a tall mast, from the top of which projected a short yard supporting an iron basket or frame, in which tar or other combustibles might be fired as an alarm on the approach of any enemy. The beacon was blown down in 1789 and was replaced during the next year by a memorial column of the Roman Doric order, standing on a pedestal and surmounted by a globe bearing an eagle. The whole height was about 60 feet. The four faces of the pedestal bore tablets of slatestone, with inscriptions commemorating the principal events "which led to the American Revolution and finally secured liberty and independence to the United States." The monument was built of brickwork covered with stucco and was taken down in 1811, when the hill on which it stood was cut down to the level of the adjacent streets; but the tablets are preserved in the Doric Hall of the State House.

It was not long after this beginning that the young architect became engaged in one of those combined architectural and commercial enterprises which are so apt to prove a snare for the too confident projectors. That part of the town which is now covered by the lower part of Franklin Street was in 1790 a swampy pasture, which a year or two later was drained and made a garden by Joseph Barrel, who lived on a neighbouring estate on Summer Street. In 1793 this area came under the control of Mr. Bulfinch and two associates, Mr. William Scollay and Mr. Charles Vaughan, who proceeded, after Mr. Bulfinch's designs, to lay out a street, of which the north side formed a straight line and the south side a crescent, with an enclosed strip of grass in the middle.* On the south side a long range of houses was built, sixteen in number, with the two at each end brought slightly forward as a pavilion, and faced with an order of pilasters, and with a central pavilion of somewhat monumental character at the middle of the curve, through which a street was brought, which took the name of Arch Street. In the grass plot was placed a memorial urn, brought from Italy by Mr. Bulfinch, on whose pedestal was an inscription to the memory of Franklin. All this has long since passed away. Franklin Street has been twice destroyed and twice rebuilt; and it is needless to say the simplicity and architectural character of its original aspect have not been retained.

The enterprise of Mr. Bulfinch and his associates was in advance of the requirements of the little town, and proved commercially disastrous; but what was misfortune to Bulfinch was good luck for Boston, since it was the occasion for his adopting as a serious profession what had heretofore been for the most part the recreation of an amateur. During the next year the Commonwealth acquired the land known as "Hancock's pasture," at the head of Beacon Street, and proceeded with the erection of a new State House from Mr. Bulfinch's designs. The corner-stone was laid on July 4, 1795, by the Governor and the Masonic Grand Master, with imposing ceremonies, the stone having been drawn to the site by fifteen white horses. The building was finished in less than three years, being occupied by the Legislature in January, 1798. The site was not then, as now, the crown of the hill; behind it rose, as we have said above, the round grassy knoll bearing the monumental column erected by Bulfinch five years before. The original design of the State House was different in some respects from the building which was erected, as that was different in some respect from the building we see to-day. Considerations of site and considerations of cost are understood to have compelled certain modifications of the design, of which the shortening of the wings was the most important. Concerning these modifications there is, however, no exact knowledge, as the original drawings have unfortunately not been preserved. They did not seriously affect the integrity of the design, whose noble and simple dignity so well becomes the commanding site.

Such was the auspicious beginning of a professional career extending over a period of half a century. We have no space to follow it in detail. A memorandum in Mr. Bulfinch's handwriting is extant, containing a list of the public and private buildings erected from his designs. They embrace almost every variety of building—court houses, prisons, hospitals, churches, banking and insurance buildings, schoolhouses, dwellings. The first theatre in Boston was built by him as early as 1793, and having been destroyed by fire was rebuilt only five years later. It was on the northerly corner of Federal and Franklin Streets, and was then thought to be the finest theatre in the United States. Its design is preserved on a medal which was struck by the proud and grateful owners, and "Presented by the Proprietors of the Boston Theatre to Charles Bulfinch, Esq., for his unremitted and liberal attention in the plan and execution of that building, the elegance of which is the best evidence of his taste and talents." This was the inscription on the reverse of the medal; on the obverse beneath the façade are the words:—"This medal entitles Charles Bulfinch, Esq., to a seat in the Boston Theatre during

life—benefit nights excepted." The design shows a front with a basement and principal storey, with a projecting centre faced with four Corinthian columns with entablature and pediment. The order is continued across the whole front, and the intervals are occupied by arched windows. The basement is quite plain, with an arched entrance in the centre, flanked by a single square opening on each side. The façade has simplicity and repose, not without a certain festal character expressive of the purpose of the building.

Of the many buildings which were erected by Mr. Bulfinch in Boston and its immediate neighbourhood, very few have withstood the rapid transformation which has converted nearly the whole area of the old town into a commercial district. The Court House, which stood on the site of the present City Hall, the Roman Catholic Cathedral on Franklin Street, opposite the side of the theatre, the Boylston Market, which has disappeared more recently, were examples of the varied lines in which his practice ran. The Massachusetts General Hospital, several of the granite banking and insurance buildings on the north side of State Street, University Hall at Harvard, and doubtless other buildings which it is difficult to trace, yet remain. The last mentioned of them was built originally with an open colonnade or piazza along its western front.

The period of Bulfinch's active life in Boston is mostly comprised between 1793 and 1818. During the whole of this period it is interesting to know that he was prominent not only as a professional man, but as a useful and public-spirited citizen. He was one of the earliest members of the Massachusetts Historical Society, and when the Franklin Street buildings were completed he offered to the Society a room in the central building measuring 27 by 40 feet. The offer was gratefully accepted, "with pleasure at such a donation from gentlemen whose feeling for the public interest and taste for architecture have ornamented the capital with buildings so exceedingly elegant as the Crescent." He was chairman of the Board of selectmen and superintendent of police from 1800 to 1815. When, in the latter year, he, with two other members, failed of re-election, "the circumstance," says Quincy, in his "Municipal History of Boston," "was a subject of very general regret. Every elected member of the Board of Selectmen immediately resigned, and on a second trial Mr. Bulfinch and the others were reinstated by decided majorities."

When, in 1816, Mr. Bulfinch was made the architect of the Massachusetts General Hospital and the Insane Hospital at South Boston, he made visits to other cities, in order to inspect their institutions of a similar character. At Washington he met the president, James Monroe, then just elected, and had some agreeable intercourse with him. The next year, making a tour of the Northern cities to celebrate the "era of good feeling" which his election had ushered in, the President visited Boston, where he was officially received by Bulfinch, as chairman of the selectmen. The pleasant acquaintance of the preceding year was renewed; the President was shown the works of the architect, and the result was the appointment during the next year of Bulfinch as architect of the Capitol of Washington, which had been half burned by the British troops during the war then recently ended. Here Bulfinch was the worthy successor of Hallet, Hadfield, Hoban and Latrobe. He resided for twelve years in Washington in this capacity, returning to Boston in 1830.

He was now sixty-seven years old and had been long absent from the scene of his earlier labours. Yet he took up his practice again, though naturally with less vigour than of old. The only important building which we know as belonging to this later period is the State House of Maine at Augusta, built of granite, and of which the design has much similarity to that of the State House at Boston. Mr. Bulfinch died in 1844 at the age of eighty-one. Mr. Quincy, in the history from which we have already quoted, says of him:—

"Few men deserve to be held in more grateful remembrance by the citizens of Boston than Charles Bulfinch. . . . During the many years he presided over the town government he improved its finances, executed the laws with firmness and was distinguished for gentleness and urbanity of manners and integrity and purity of character."

STREET AND DRAINAGE IMPROVEMENTS IN LEEDS.

WHILE a crowd of smaller but not unimportant matters have occupied the attention of the streets and sewerage committee from time to time, it has been and still is steadily engaged, says the *Leeds Mercury*, in dealing with two of the largest problems that municipal government has to grapple with. A system of street improvements involving a million of expenditure, and half of which has to be dealt with during the next four or five years, is not by any means a small order, and the construction of sewage purification works on the lines of modern requirements for a present population of 400,000 and a

* The original plan was symmetrical, with a curve on each side and an elliptical grass plot, but the projectors found it impracticable to secure the requisite amount of land on the north side.

prospective population of three-quarters of a million, and involving another half million of expenditure, is also one of those questions the dimensions of which a few years ago would have been considered national rather than municipal. In regard to the street improvement question there is every year a number of small improvements forced upon the consideration of the committee by the building operations of the year. Wherever it is proposed to spend money upon a building which already projects into a road, or to build premises abutting upon a road which is too narrow, the streets committee are bound to consider at once what the extent of widening shall be, and to negotiate the compensation to be paid to the owners concerned. During the last year there has been more than usual of this kind of work, and no doubt as Leeds increases there will be more and more. Within the past twelve months there have been thirty-five such improvements, involving a total expenditure of nearly 19,000*l.* in sums varying from 2,400*l.* to 46*l.*, and in one case 15*l.* Each of these items has involved plans, committee meetings, negotiations almost endless, and whose extent is not always in direct ratio with the amount involved, a very small matter often involving greater labour than a larger project. Last, but not least, there is the great fight of each question through the Council, where, out of the total of sixty-four members, only twenty-two, *i.e.* the committee, can be expected to thoroughly understand the case without much explanation and discussion.

Immediately the Leeds Improvement Act, 1893, came into force this year, the streets committee asked the Council for permission to commence the improvements authorised by the Act. After several attempts, abortive partly from the process being novel and partly from the indisposition of a few members of the Council to embark on so large an expenditure, the Council authorised the committee to proceed with the most important of the improvements. These were the widening of North Street, Vicar Lane, Meadow Lane, Park Lane, Burley Street, Burmantofts at its junction with York Road and Marsh Lane, and of Beeston Road at Hunslet Hall Road, the total estimated outlay involved being 194,939*l.* The whole of the necessary notices to owners of property were promptly served. The owners are now sending in their claims and the names of their arbitrators, after which, the Corporation having also nominated their arbitrator, an umpire will in each case be appointed, and there can be no doubt that in the ordinary course of business, and provided other matters are not allowed to take precedence, the whole of the properties involved in these magnificent improvements will be in the hands of the Corporation to work their will upon within the next twelve months. The committee were fortunate in frustrating an effort of the markets committee to get an order of the Council to rebuild, with a nominal rounding off of a corner, the Central Market, which had been destroyed by fire; and, having secured from the Council an instruction to have the whole of the site cleared, they will in March next, when the tenants' notices expire, go forward with the widening of New Market Street and Duncan Street at that point. This is essential to the completion of the widening of those two streets in their whole length between Kirkgate and Briggate, and will prolong the line of widening of North Street and Vicar Lane.

The laying out of new estates by private owners has involved during the year the construction of 13 miles of new sewers, and in addition to this the Corporation have laid at the cost of many thousands of pounds large storm or rainfall sewers in several districts, notably round St. George's Church and down to West Street. They have also laid the large intercepting sewer for the Hunslet and Meadow Lane area, the Cardigan Road and Victoria Road district, and for Headingley Lane, Harehills Road and also Green Road, where rainfall sewers have been laid to prevent the flooding of Beckett Street and Burmantofts, and properties abutting on Green Road.

In regard to the other important question—the purification of the sewage—we understand that the engineer is well advanced with the preparation of his report. The committee have visited the sewage works of some of the largest towns and have there seen the best examples of sewage purification, and a printed pamphlet has just been issued for the use of the Council giving full particulars of these works as well as those of Leeds. During this year special surveys have been made and levels taken along the valley of the Aire for a distance of some seventeen or eighteen miles, with a view to affording information on which to base all the alternative schemes which can possibly be found for dealing with the question. It is quite clear that the fall of the Aire Valley being very slight, any scheme involving a large area of land must of necessity either have its site at a distance of many miles from Leeds, or, if nearer home, must involve pumping operations. A few thousand acres of land and twenty miles of outfall sewer, at 15,000*l.* per mile, add up to such a sum that there can be no doubt that the Council need both time and special wisdom in dealing with this matter. In the meantime they must turn to best account the Knostrop works, which, though far from per-

fect, have done much good service for the last twenty years. The other local authorities concerned and which are now sadly in arrear can be getting into line in the same time. As a means of reducing this big scheme as far as possible advantage is being taken of the fact that lands, very suitable for purification of the sewage of Rodley and Bramley, are to be found abutting on the river, partly in Horsforth and partly within the city and partly in Calverley. Parliamentary powers to take these lands for the purposes named recently came into force, and already plans for the drainage of the district and disposal of the sewage on the land are completed, and the arbitration for the major portion of the land is now proceeding. These works will be commenced within the next few months.

GLASGOW SCHOOL OF ART.

THE first of a series of eight lectures on Mediæval architecture has just been delivered by Mr. Alexander M'Gibbon, in the west room of the Corporation Galleries, granted by permission of the Parks and Galleries Trust. Mr. T. L. Watson, president of the Glasgow Institute of Architects, occupied the chair. After defining his terms and the scope of his subject, the lecturer explained that while Scottish work would be duly examined, he had not thought it advisable to limit attention to what was best derived from the south; the borrowing from England continued almost until the Renaissance, when the indebtedness was transferred to France. He then discussed the widely accepted, but too exclusive, definition of what Gothic as a style is compared with Romanesque; a definition given currency to by too partial admirers of French work and one that would discredit many of the best English examples. It was granted that at various times the initiative in development of style was taken by France, but claimed as a merit in English work, that, at first simply copying, in due time there was an assimilation of the new methods, and a consequent growth of a characteristic phase of the style. The first true English style owning no foreign parentage was the Perpendicular, often most unjustly decried, and its development was intruded upon by the Renaissance; but the life was only repressed, not extinguished, as the Gothic revival of fifty years ago proved, and to-day Gothic as a style lives and will live. In France, however, its glorious course was finally checked by the revival of Classic art, and now it attracts only an archaeological interest. The lecturer then criticised the claims of several to be the exponents of the true spirit of Gothic architecture—the ecclesiologist, who finds in its forms the expression of Church doctrine; writers, such as Mr. William Morris, who approve of Gothic, but at the expense of Renaissance, because of its being the work of free Englishmen and not of the tyrannical Medici, and of Mr. Ruskin, because of its supposed affinity to nature in plant and animal life, and finally, of the practitioner who, without attempt at adaptation and in violation of universal tradition and practice, bodily transfers from other styles. The lecturer then spoke on the legitimate authority he would accord to precedent, and finally on how Mediæval architecture should be studied. Gothic, as the artistic language in which much of our national history had been written, in his opinion, would yet find favour in Greater Britain, and when in Central Africa Scotsmen multiply, there will undoubtedly be required material reminiscences of St. Giles's and Melrose. Throughout the lecture numerous lime-light illustrations were exhibited, and at the close a vote of thanks to the Chairman was moved by Mr. William Forrest Salmon.

ART TUITION.

A LECTURE was delivered on Monday by Professor Herkomer, R.A., at the London Institution, on "Sight and Seeing, or Art Tuition." He said that the subject of art tuition was one which had deeply interested him, and to which he had *con amore* devoted the best part of his life. In no branch of mental training was there more danger in the formation of habits of thought than in art training. On the face of it, the plan of distributing means of education both by art samples and other help to small country towns was a good one, and the idea of getting objects from a central museum on loan was also a good idea; but the schools of art had not been justified by their results during all these years, for the system had grown into an unwieldy piece of machinery under the influence of impersonality. We had now arrived at a time when we must either change the system or abandon it altogether. There should be for each town its staff of masters, one for each branch of art, and when they had selected their masters they must let them be masters. The longer his experience, the more certain was he that the art faculty in any human being was worked by the character. Provided the natural gift was there, its successful use depended on the moral character of the

individual. For that reason the art master must be the student's best friend. He wished to impress upon his hearers the necessity for personality in teaching, which meant seeing deeply into the whole nature of the student. Art tuition should begin with the child at school, for drawing, if properly taught, was bound to help seeing in every child. There must, however, be no mistake in the methods. He was opposed to the work from the antique to which many art students devoted much time, and advised the substitution of life casts. The study from the nude was the great and all-embracing method for ripening the art perceptions which nature had implanted in man, so for that goal every real art student's heart yearned. It was by these means that the student acquired his mastery over technique, and the loss of such exercises in early youth was felt by a painter throughout the rest of his life. The moment any system of training became impersonal, it became stereotyped and lifeless. He recalled with gratitude the advice of an artist who recommended him not to exhibit his first oil-painting. "You will do better next year," he said. He waited until the next year, and then sent in a picture which was hung on the line at the Royal Academy; but it was so like Walker's work that it was mistaken for a picture by Walker. A little later he unconsciously freed himself from this influence and painted the "Chelsea Pensioners;" but when he had finished the picture, he was almost heartbroken because it was so unlike Walker's work. That was an example of the effect which one artist might have on another, but the great thing was for each man to work in accordance with the dictates of his own individuality. Finally, whatever forms of tuition were adopted, the one motive power to make them successful was enthusiasm.

SOCIETY OF ARCHITECTS.

THE annual general meeting of the Society of Architects was held in St. James's Hall on Tuesday, when the various office bearers for the coming year were elected. The proceedings were presided over by Mr. George Highton, the retiring president. Mr. Edwin J. Hamilton, of Brighton, was elected president for the next year; and Mr. Ernest Day, of Worcester, and Mr. Banister Fletcher, of London, were elected vice-presidents, but it was announced that the latter was unable to accept office; Mr. Ellis Marsland was elected hon. secretary, Major Leslie, R.E., corresponding secretary, Mr. H. G. Quartermain, treasurer, and Mr. S. C. Johns, auditor. The following members of Council were also elected:—Messrs. William Allport, C. A. Bassett-Smith, J. W. Frazer, Edgar Farman, Herbert J. Jones, Robert Keith, Henry Lovegrove, W. R. Mallett, G. A. T. Middleton, George Thomas, Edward Tidman and Silvanus Trevail. The chief remaining business before the meeting related to the report of the Council, recommending that a system of examination of candidates for membership of the Society be instituted. The Council, however, suggested that two classes of candidates should be exempted from the examination, where the candidates had reached a certain age and acquired a certain amount of experience. The meeting, which did not number more than fifteen, eight of whom were members of the Council, was much divided in opinion as to the institution of a scheme of examination, and Mr. Seth Smith moved an amendment to the Council's report, that the institution of any examination be postponed, in the hope that the Royal Institute of British Architects would speedily promote legislation for the compulsory examination of all architects, and securing for itself the privilege of being the sole examining body. It appeared that a committee of the Council had sent out a series of questions, asking the 500 members of the Society whether they were in favour of an examination. About sixty replies had been returned, 90 per cent. of which had been in favour of examination. Mr. Hicks described the proposal of the amendment to transfer the examination to the Royal Institute of British Architects as humiliating to the Society, and Mr. Seth Smith, under the pressure of several members, withdrew the reference to the Royal Institute securing for itself the privilege of being the sole examining body. In this modified form it was still objected to.

Mr. Stonor seconded the amendment, which was rejected by eight to five.

Mr. Edgar Farman moved an amendment, which left the Society the power of conducting an examination of its own, but making the examinations of certain educational and other institutions qualifying examinations for membership. The Council accepted this amendment, which was carried by ten to three, and the proceedings then terminated.

Mr. W. H. Bidlake has arranged to give a course of twenty-four lectures at the Wolverhampton Art School during the winter months. The syllabus comprises studies in Egyptian, Assyrian, Persian, Phœnician and Lydian, Greek, Roman, Early Christian, Byzantine, Romanesque, Norman, Early English, Decorated, Perpendicular, French and Italian Gothic, Italian and French Renaissance, and English Renaissance.

GENERAL.

The Royal Institute of British Architects' first general meeting of the session, 1894-95, will be held on Monday, the 5th inst., when the chair will be taken at eight o'clock. Mr. Francis C. Penrose, F.R.S., president, will deliver the opening address of the session.

Mr. Wootton-Isaacson, M.P., has just opened a very popular industrial exhibition in the St. Benet's Hall, Stepney.

The Liverpool Architectural Society will hold their second ordinary meeting on Monday, November 5, when a paper will be read by Mr. E. W. Cox, of the Historic Society of Lancashire and Cheshire, entitled "The Value of Archæology to Architects, as Exemplified by the Ruins of Birkenhead Priory."

Mr. Alexander M'Gibbon has opened a course of lectures on "Mediæval Architecture" in connection with the Glasgow School of Art in the Corporation Galleries.

The Society of Engineers have arranged for the annual dinner to be held at the Holborn Restaurant on Wednesday, the 12th inst.

The General Meeting of the Royal Archæological Institute of Great Britain and Ireland will be held at 20 Hanover Square, W., on Wednesday, November 7, at 4 P.M., when a paper will be read on "English Municipal Heraldry" by Mr. W. H. St. John Hope, M.A.

Mr. S. Maylan, Noel Street, Nottingham, has been appointed surveyor and inspector to the Basford Sanitary Authority, Nottingham, by nineteen votes out of twenty-one. There were ninety-eight applicants for the post.

The Hotel in Prince's Street, Edinburgh, belonging to the North British Railway Company, is to be rebuilt, and plans are to be invited from a limited number of Edinburgh and Glasgow architects.

The Emperor of Germany has given 12,000 marks out of his privy purse as a contribution towards the construction of a theatre in Bromberg.

Mr. A. Loader, of Brighton, has been appointed architect for the new Board School which is to be erected at Shoreham.

Mr. Henry Harben, J.P., a member of the London County Council, has promised to give 4,000*l.* for the purpose of building a convalescent home near the seaside for working-men of Hampstead and Kentish Town.

Plans are in preparation by Messrs. Cunningham, Blyth & Westland, of Edinburgh, for the new Waverley Bridge in that city.

The Action taken by M. Bourgeois, a builder of Lourdes, against M. Zola for defamation of character in a chapter of "Lourdes" will not be tried until December 19.

The Parthenon is in a dangerous state through the earth tremors of this year in Athens, and it has been decided to adopt means to insure its stability.

Mr. J. Charlton's *Balaclava* has been purchased by the Corporation of Blackburn for the new gallery. Mr. Bowdler has presented the Hon. John Collier's *Hetty Sorrel* to the gallery and Mr. Hornby, M.P., a portrait of his brother, Mr. A. N. Hornby.

The Maire of Bayeux has reported to the Academy of Inscriptions that the Bayeux tapestry is decaying.

The Exploration of the tumulus in Parliament Hill Fields, Highgate, was commenced on Monday, under the honorary direction of Mr. C. H. Read.

Colonel G. T. Plunkett, R.E., has been appointed secretary to the Royal College of Science, Dublin, which is one of the institutions of the Science and Art Department.

At the Anniversary meeting of subscribers and governors of the Nottingham General Hospital it was stated that Colonel Seely, M.P., had offered to purchase a large residence known as The Cedars, three miles from Nottingham, and to adapt it for the purpose of a convalescent home in connection with the hospital. Colonel Seely also intimated that he would increase his subscription to the hospital to 200*l.* a year. There are five acres of ground surrounding The Cedars.

The Restoration has been completed of the tower of St. Michael and All Angels Church at Heydour, near Sleaford, at a cost of 500*l.* The work was rendered necessary in consequence of the failure of the foundations, which entailed six months' labour to make the tower safe and restore it to its original condition. Mr. Wm. White, F.S.A., of London, was the architect.

The Duke of Cambridge has signified his willingness to give a piece of ground as the site of a vicarage for Kingston Vale.

The Art Gallery Committee of the city of Manchester have arranged to hold an exhibition of contemporary arts and crafts in the rooms of the City Art Gallery in April next. The intention is to bring together a display of fine examples of industrial art, with a view to educate the public taste and to stimulate the desire for all that is excellent in design and workmanship.

The Architect.

THE WEEK.

AMONG the writers about art in England the late Mr. PHILIP GILBERT HAMERTON held a position that was peculiar. He could paint, draw and etch as well as describe, and, moreover, he was a man of business to whom artistic works were commercial speculations, and therefore reserved the most important part of the arrangements for producing them to himself. Mr. HAMERTON was a native of Lancashire, and was born in 1834. In his twenty-first year he went to Paris to study painting, and remained abroad for a couple of years. He next took up his residence near Loch Awe. His first book was a volume of poems descriptive of the isles of Loch Awe and other northern scenes. One of the mottoes was from GOETHE, "Let no one say that reality lacks poetic interest," and the verse was little more than prose arranged in lines. It was, however, in keeping with the woodcuts, which are very realistic. Mr. HAMERTON was at that time a competent etcher, for he proposed to bring out a volume of a hundred plates to illustrate his verse. Unless we are mistaken Mr. HAMERTON was afterwards a teacher in one of the northern schools of art. In 1861 he took up his residence in Sens, a little city which he afterwards described in a manner that revealed his affection for French life. He worked hard as a painter, and studied the styles of French painters with care. This enabled him to write his "Contemporary French Painters" and "Painting in France after the Decline of Classicism." The *Portfolio* was started in 1873 under his control, and at once exemplified the possibility of employing etching for periodical publications. To the pages Mr. HAMERTON was a constant contributor. His "Graphic Arts" appeared in 1882, and his book on "Landscape" in 1885. For the "Artistes Célèbres" series he wrote a memoir of TURNER, in which he maintained that the painter's superiority was in representing clouds, and that TURNER was as assiduous in studying the works of his predecessors as in studying nature. Mr. HAMERTON rendered excellent service to the graphic arts in this country, and his efforts to make French art and French ways more appreciated in England deserved a higher acknowledgment than the decoration of Officier de l'Académie, which is only a consolation prize for those who are ambitious but feeble.

THE plans for the new meat market in Birmingham prepared by Messrs. ESSEX, NICOL & GOODMAN were submitted to the trade, and various alterations were in consequence suggested. The architects estimated the cost of the works as follows:—Buildings, including gas and water, ventilating and sewerage, 40,000*l.*; gear and permanent fittings, 5,000*l.*; architects' commission and sundries, 3,000*l.*; total, 48,000*l.* As the tenders received were higher in amount, the markets committee decided to have amended plans and drawings prepared by the architects. The principal alterations in the original designs are as follows:—(1) The meat market roof is simplified in construction by making it in one span instead of two, and omitting the central girders and stanchions; the height of the side-walls is reduced from 40 feet to 35 feet from floor-level. (2) The height of the basement for the cold stores extending under the meat market is reduced to 13 feet. (3) A rearrangement of the buildings next the Gullet is made by which a considerable expenditure on foundations and excavations is avoided. (4) The tower is reduced from 145 feet to 120 feet in height. (5) The screen walls enclosing the ends of the yards from the streets are reduced to about 20 feet in height. (6) Some of the terra-cotta embellishments are omitted in the elevations, and also the glazed brickwork in the subway. (7) In addition to the above items there are a number of minor variations which also do not affect the efficiency of the buildings. With the foregoing alterations, the total cost of the work, based on Mr. JOHN BOWEN's schedule of prices, will amount to 49,375*l.*, to which the committee have added 625*l.* for contingencies, bringing up the cost of the buildings and fittings to 50,000*l.*, making, with the architects' commission and sundries, a total of 53,000*l.* The committee recommend the Council to approve of the proposed alterations in the

plans and to authorise them to have the work carried out in accordance therewith at an additional cost of 5,000*l.*; also to instruct the finance committee to borrow that amount.

THE difference between a drain and a sewer is not always easy of comprehension. In the Metropolis Management Act, 1855, the word drain is taken to "mean and include any drain of and used for the drainage of one building only, or premises within the same curtilage, and made merely for the purpose of communicating with a cess-pool or other like receptacle for drainage, or with a sewer into which the drainage of two or more buildings or premises occupied by different persons is conveyed, and shall also include any drain for draining any group or block of houses by a combined operation under the order of any vestry or district board." But in many clauses of the Act sewer is used as equivalent to drain. A decision just given in the Courts shows that the order of a vestry or a board is not indispensable in order to recover outlay on drains. In the parish of St. Leonard, Shoreditch, are two blocks of model dwellings known as Norfolk Buildings, separated by a causeway 20 feet wide. The drains were laid in 1882. A notice was served on the owner in November 1892, requiring the drains to be reconstructed. As the work was not executed at the prescribed time, the Vestry expended 20*g.* 7*s.* 6*d.* upon it. The owner declined to pay on the ground that the drains formed a sewer, and that originally they were not laid down under the order of the vestry. Mr. ROSE, the magistrate, decided that a main drain, draining blocks of houses by a combined operation, was, under the circumstances, and notwithstanding the absence of any order of the vestry, a drain and not a sewer within the meaning of the Act. The owner appealed, and the arguments were heard on the 1st inst. Mr. Justice MATHEW held that the magistrate was right, as the drain in question was not a sewer within the meaning of the Statute. The causeway was within the curtilage of both buildings, and therefore the appellant was liable to execute the works. In that opinion Mr. Justice CHARLES concurred. The appeal was accordingly dismissed with costs.

THE progress of Mr. REGINALD BARRATT as a draughtsman in black and white has been remarkable, but few could have realised that he possessed so delicate an aptitude for colour as is visible in the drawings from Egypt, India and Italy which are to be seen in the Fine Art Society's room in Bond Street. That Mr. BARRATT can draw architecture with understanding does not need saying; but the use of colour has enabled him to suggest the character of the buildings with surprising fidelity and pictorial effect. The collection forms one of the most interesting "one man" exhibitions which are now to be seen in London, and should attract all who can appreciate excellent work.

ANOTHER prominent architect and one of the best types of the citizen soldier has been lost to the country by the sudden death of Mr. CHARLES GEORGE HOOD KINNEAR, A.R.S.A., in Edinburgh, on Monday evening. He was in his sixty-fourth year, but from his fine martial appearance it might be supposed he was a much younger man. Mr. KINNEAR received his training in DANIEL BRYCE's office in Edinburgh, where opportunities were offered for becoming acquainted with many varieties of building. He practised for a time on his own account, and then he entered into partnership with the late Mr. DICK PEDDIE, afterwards a member of Parliament. The firm of PEDDIE & KINNEAR soon acquired a reputation throughout Scotland and upheld it for many years. Afterwards the title was changed into KINNEAR & PEDDIE, when a son of the former senior partner entered into the firm. In Edinburgh a great many buildings were designed by the partners as well as country houses in all parts of Scotland. Illustrations of some of their buildings have appeared in *The Architect*. In 1859 Mr. KINNEAR joined the Mid-Lothian Coast Artillery as a gunner, and in a year he received a commission in a grenadier company. He was promoted from time to time until 1884, when he succeeded to the command of the regiment. Since then his zeal and liberality have done much to insure its efficiency. Colonel KINNEAR's loss will therefore be felt in many circles of the north.

ROSSO DEL ROSSO.

IN the article on BENVENUTO CELLINI which we published lately (*The Architect*, Oct. 19, 1894), we described some of the troubles which beset FRANCIS I. in his efforts to introduce Italian art in France. There seemed to be a sort of fatality about the experiment which would have daunted kings no less brave. LEONARDO DA VINCI had hardly arrived in France before he died. ANDREA DEL SARTO made off with the money that was entrusted to him for the purchase of works of art. MICHEL ANGELO refused to leave Italy. How many other artists caused inconvenience to FRANCIS I. is never likely to be revealed. His anxiety to import painters and sculptors was known in every atelier in Italy, and it is probable that more men proffered their services and received travelling expenses than the chronicles relate. An anecdote which VASARI supplies about GIOVANNI BATTISTA DEL ROSSO, known afterwards as Maitre Roux, suggests that in the sixteenth century France was looked upon as a sort of Promised Land by the Italians. Rosso, we are told, used to express a hope that he might end his days in France in order to be free from the poverty and misfortunes which oppressed men who were doomed to live in Florence or elsewhere in Italy. With a view to his residence in France he began to learn Latin, in order to have a means of communication with the natives and to appear learned. He was not aware that about the same period the wandering ERASMUS was unable to meet with three people in France and Germany who were able to use that language in conversation. An accident hastened Rosso's departure before his linguistic powers were perfected. He attended the tenebræ service with one of his pupils on the evening of Holy Thursday in a church near Arezzo. When, according to custom, the lights were extinguished, and the people engaged in silent prayer, the youth let off fireworks, which caused consternation. Some of the religious scolded and beat him, as he deserved. Rosso interfered. The people were excited, and treated the painter as the culprit. He fled from the town and country, leaving a work unfinished for which he had been partly paid, and regardless of the consequences to a friend who had become security for its completion. He made his way to France, where he was at once welcomed by the king, who assigned him a pension of 400 crowns, with a residence in Paris. His arrival was about the year 1532.

At the time Rosso could not be said to have possessed a European reputation. VASARI endows him with talents which would not be inferred from the character of the few works by him that have survived. He was a Florentine, and all that is known of his early years is that, like many of his contemporaries, he practised drawing by copying MICHEL ANGELO's *Battle of Pisa*. From the description of his paintings he would appear to have been most successful when painting children as supporters of heraldic shields. His manner of working was novel, for he generally made the faces ugly, and by degrees imparted to them a pleasing appearance. The amount of success he obtained in Florence was not to be won when he visited Rome. VASARI has to admit the failure. That he was self-reliant is evident when we find that his biographer was unable to discover the names of any painters who gave him instruction in art. We may assume him to have been self-taught, and accordingly he was not faithful to any style. The laxity of his æsthetic principles is also apparent when we find him mixing sacred and profane incidents in the same picture without any notion of their incongruity.

FRANCIS I. did not hesitate about placing the decoration of Fontainebleau under the control of Rosso. He began with the grand gallery. He employed decoration in a sort of stucco on a grand scale, some of the figures being life-size. The panels he filled with representations of the life of ALEXANDER THE GREAT. Rosso was not a modeller, and the work was executed by other artists from his designs. The number of painters and sculptors employed under the direction of Rosso and PRIMATICCIO was very large. The names have survived of BELIN, called MODENA PELLEGRINI, RENAUDIN, LUC ROMAIN, MINIATI of Florence, RUGGIERI of Bologna, JOHN of Bagnacavallo, SAMSON, PENNI, BALDOVIN, DUBREUIL, JEAN and VIRGIL BURON, CACHETEMIER, CARMOIS, CHARLES and THOMAS DORIGNY,

FANTOSE GERARD, FRANCIS, JEAN and LOUIS LÉRAMBERT, SIMON LEROI, ROCHELET MUSMER, LEMOINE, POMETART, SAILLANT, GIROUX, JACQUIO. Judging by their names, Germans, Flemings and Italians as well as Frenchmen were engaged in the first half of the sixteenth century at Fontainebleau as painters or sculptors. The men who are named were competent artists; the inferior ranks are not recorded. According to tradition Rosso assumed the airs of a superior being among his fellow artists. As for the natives, such as FRANCIS OF ORLEANS, SIMON OF PARIS, CLAUDE OF TROYES and LAURENT OF PICARDY, he treated them with disdain. There was a curious similarity of manner between Rosso and CELLINI; both were swaggering Italians, who believed that audacity could become a substitute for genius. Rosso apparently was fond of producing figures that went beyond MICHEL ANGELO's in their muscularity, and he demanded more respect for them and for himself than the great Florentine would have cared to seek. In the mind of FRANCIS I. there were some vague recollections of MICHEL ANGELO's work in Florence, which was recalled by Rosso's exaggerations; but the king was not endowed with sufficient critical power to discriminate between the originals and the imitations. Rosso's work for a time left traces on French art which were not advantageous, but happily they were counteracted by the influence of the work of PRIMATICCIO and NICOLÒ DELL' ABBATE, who of all the Italian artists were the most beneficial to France.

It is now impossible to judge of the merit of Rosso's work at Fontainebleau. PRIMATICCIO is supposed to have destroyed or concealed the greater part of it, and if the paintings bore any resemblance to the scripture piece bearing Rosso's name which is in the Louvre, it would be difficult to discover a style less adapted to the decoration of a summer residence. His time was not entirely occupied with wall paintings. He designed gold and silver plate and jewellery. When, in 1539, CHARLES V. visited Paris, the decoration or architectural scenery was carried out under Rosso's direction, and his love of the colossal would have its use on such an occasion.

His rewards were magnificent. He was endowed with a canonry which yielded wealth. His income from the king rose to a thousand crowns. According to VASARI he lived as a prince rather than as an artist. He possessed numerous servants, a stud of horses, a house that was filled with valuable possessions. Rosso became a grand seigneur. But he was not destined to enjoy his possessions for many years. Some money was stolen, and he accused his associate FRANCESCO DE PELLEGRINO of the theft. The courts were eager to assist the king's favourite, and the Florentine was tortured. But no confession was wrung from him, and he was therefore liberated. It was natural for FRANCESCO to seek revenge, and Rosso may have felt his life was forfeited. He preferred, however, to become his own executioner, and by poisoning himself he escaped the wild justice of his former friend.

NOTES ON THE GREAT RAILWAY STATIONS OF LONDON.—II.

[BY A CORRESPONDENT.]

PROCEEDING with the comments on the interior of the Great Northern Terminus, King's Cross, though, like the exterior, it is plain, there is a solidity and strength in the general construction which is impressive. The proportions, too, are good, and the considerable length with the far perspective of bold deep arched ribs (flanges of each forming a truss) is very effective, much more so than the cheaper plan adopted in roofs of less span, with their numerous tie rods, &c., of small diameter. It has been before remarked that this station is in two spans of equal width, separated by substantial though plain semicircular arches carried on solid piers, three of the latter being much longer than the others, and one of the archways panelled where extra strength seemed to be required. It is a great relief to the eye to gaze upon all this mass of honest stock brickwork after looking at little but iron construction elsewhere in the building. The appearance of this station is

monotonous as compared with the Paddington one with its transept-wise roofs, but it has the advantage in the satisfactory longitudinal bond in the substructure which the wide piers and arcade afford. There is also one feature which is superior to that of several stations, viz. the unbroken expanse of glazing in the highest central part of the roof, which has a much better appearance than intermediate long lengths of wood panelling. This soon gets obscured by smoke and steam and gives a heavy depressing appearance. When the writer examined the station a short time since the roofs were being cleaned and repainted without the use of scaffolding, as a movable timber stage made to fit to the section of this big roof, of sufficient width to hold the painters, was employed. This seemed a clever contrivance for a terminus having such an enormous traffic during the greater part of the twenty-four hours.

There has been an addition made during the last two years that the original builders could never have foreseen, but which must be an immense convenience to travellers and the railway officials, considering the great length of the station. This is the broad iron bridge, naturally erected at as low an elevation as possible, which crosses the terminus about mid-way. It has been designed to have the maximum of strength with as few intermediate supports as possible. Therefore the lattice girder principle has been adopted, which has the double advantage of serving as a balustrade (though rather a lofty one), and carrying the iron stirrups on which the pathway is hung. Useful as this bridge must be, it is architecturally detrimental to the appearance of the station, as can be readily imagined, and seems out of scale and harmony with the surroundings. It, moreover, looks uncomfortable to see nothing under the pathway itself in the way of support beyond the thickness of the stirrups, though as a matter of fact the strength is redundant. The manner in which the "collapsible" sliding-gates on the bridge leading down to the several platforms are so quickly worked, locked and unlocked by the attendant guards at the proper moments is very ingenious. Everything has been done by the present directors to save time and trouble to the passengers, &c., in a manner which would astonish the originators of this station, of whom probably scarcely one now survives.

The Euston Station of the London and North-Western Railway covers an enormous area, but the promoters started with a very grand scheme, of which the only features properly carried out are the great Doric entrance to the station yard and the fine central hall, to which possibly could be added the two lofty booking-offices on either side of the latter, well lighted by small glass domes, but in other respects calling for no particular remark. The station proper is commonplace, and those large extensions made since it was first built, to meet the exigencies of the constantly-growing traffic, are very utilitarian. The central hall takes up a lot of room, and must be in the nature of a "white elephant," being much larger than is necessary for its purpose—so much so that the writer was informed on excellent authority that the directors have actually had it under contemplation to do away with this noble apartment, as well as the booking-offices on either side, but mercifully, as far as Art is concerned, gave up the idea, for the present at any rate. There is nothing very new to be said about this much-admired feature at Euston. Its proportions are of course good, and the treatment of the gallery at the first-floor level of the station offices (which extends all round the hall) is effective, the cantilevers here being much better managed than at the booking-office at King's Cross. Then there is the colossal statue of the great engineer, GEORGE STEPHENSON, very appropriately placed here, and the grand staircase, with its double flight to start with, which looks as if it ought to be used by passengers, but of course is not. In the landing above, the yellow glass to the skylight gives the theatrical effect like that to be seen at the cenotaph of the Princess CHARLOTTE at St. George's Chapel, Windsor. The exterior of the hall is practically invisible, as far as the general public is concerned. As has been remarked, there is nothing particular to comment upon in the station after what has just been described. The covered yard for vehicles is of the ordinary description. The south elevation, with the big Doric entrance, has various stuccoed offices and other buildings; the west side is of plain stock brick with a

series of gables facing the street, possessing no architectural character whatever, and the east side of the station consists of only a brick wall, having semicircular arched openings in the upper part, the roof with its numerous gables towards Seymour Street appearing above. Until one has walked right across the whole breadth of this station step by step it is not easy to realise its immense width, being subdivided into so many aisles, and it is extremely difficult to see from side to side. The height up to the springing of the roofs is not great, and the general impression of this terminus is that of lowness. The history of the enlargement of the building resembles that at Waterloo, as the original central part has been extended on either side, and not only on one side like at Paddington and Liverpool Street. The old station is covered by span roofs of the ordinary description with tie rods, &c., and had the aisles been of greater width some distortion must have occurred, as a considerable part is on a curved plan. It has been found necessary to build a very plain-looking bridge over the west part, which is by no means an improvement to the *ensemble*. It is to be regretted that this terminus could not have been enlarged on a more methodical principle, like, for instance, the Great Eastern station at Liverpool Street has been (to be commented upon further on). The writer has endeavoured to thus briefly give a general description of the Euston terminus, but it is difficult to compress when touching upon so very large a building.

The terminus at Waterloo forms such a peculiar aggregation with its original central station and its large north and south annexes, and is so out of the common in its external and internal arrangements that it is really not easy to say where it begins and ends, owing to the many "ins and outs." The writer has attempted to walk all round but retired discomfited, as the task proved too difficult and moreover "the game was not worth the candle," for no good views can be obtained anywhere. Architecturally it may fairly be said this station has no exterior, except possibly towards the Waterloo Road, but this is of the most commonplace description, even the south station (which is badly discounted by two railway viaducts adjoining it) only comprising a large and wide carriage-porch carrying a superstructure on iron columns and brackets of an ornamental character of the usual type. On mounting the staircase up to the station beyond a similar remark can be made. But it has at least the negative merit of having no pretension or affectation about it. The central station possesses in its narrow end towards Waterloo Junction a survival of that mixture of timber and iron roof construction, with wood tie-beams, which it is believed is now unique in London as far as respects a passenger station. But this is only a very small bit after all of this huge terminus, and one wonders how many of the thousands of travellers have noticed it. So soon as the central station widens the ordinary iron tie-rod construction is employed with span roofs, and being on a curved ground plan the perspective effect is all the better. But the north station, a later addition, is quite differently built in two spans, so to speak, having strong lattice girders transversely and longitudinally, with ridge and furrow roofs of small span carried on girders. But a peculiar and rather effective feature consists in the manner in which diagonal curved iron braces are employed in each bay of the roof, which is unique so far as the writer is aware. Their appearance is somewhat injured owing to the girders which carry what is here an important feature—the gutters—coming so close above these arched braces. If this section of the terminus had boasted rather more height it would have been advantageous; but the total height is greater than that of the older central station. The iron stanchions or piers between the two spanned roofs of this particular part of the station are so planned as to come in between the lines of rail. This is more convenient than their resting on a platform, as is the case at the London, Chatham and Dover (Victoria) Station. Though there is nothing but what is of the most ordinary type in the exterior of the terminus next York Road, the directors deserve a word of thanks from the public for the tasteful way in which they have planted the embankment of a large siding, making it an ornament and something pleasant to look upon from the adjoining streets. To conclude the notice of this enormous station, its growth

has been forced on by an increase in the traffic which the original directors could never have possibly foreseen, and it would be manifestly unfair to saddle upon their successors any blame for the necessary makeshift manner in which the additions have been obliged to be undertaken from time to time.

It is indeed difficult to picture anything more hideous than the "façades" of the two important stations at Victoria, ranged side by side. But many Londoners, though of artistic taste, have got so accustomed to this monstrosity that they do not realise how others, such as foreigners, regard it. There has not been the slightest attempt on the part of the railway "powers-that-be" to make either of these stations worthy of the fine situation they occupy. Are they blind? Yet the Chatham and Dover terminus, except for the Charing Cross Station, is one of the greatest points of arrival and departure for our Continental visitors, who must marvel at our English taste, or rather want of taste. Take first the Chatham and Dover Station of the two neighbours, which, like many others, is two-aisled, but in this instance the northernmost wing is longer than the other one, and stands somewhat in front of it, and the intermediate space on the splay plan is all occupied by a mixed mass of temporary-looking sheds, guiltless of the remotest idea of being architecturally designed, while ugly staring label-boards are fixed up in the most conspicuous positions. No attempt whatever has been made to embellish the ends of the big station roof behind, which stands up in its naked simplicity. To be fair, it is believed these various erections were originally considered to be only temporary. But, however, there they stand unaltered up to the present day, doubtless owing to monetary reasons about which the directors know more than the writer of these lines. One regrets that the Grosvenor Hotel had not been built, at the onset, in front of the ends of one or both these stations, as at Charing Cross, Cannon Street and St. Pancras, instead of at the side. Further, the yard in front of the booking-offices, with its high wood palings and the accumulation of omnibuses and cabs, combine to make a regular jumble. In truth, the whole of these station buildings look as if planted down anyhow, like the streets of some of the towns in North Wales—Dolgelly, for example. Externally the buildings next Wilton Street are of a commonplace character. The booking-office of the main line is fairly lofty, having a coved ceiling with a skylight of domical construction. Looking at the interior of the station itself there is not much in the roofs beyond the usual type. The height up to the wall-plate is less than at Charing Cross and Cannon Street, but there is the advantage of a good well-defined cornice line, which it will be noticed is conspicuous in its absence in some of the larger stations. On the other hand, the cambered iron ties with numerous suspension rods and other constructional ironwork above are certainly not elegant. The purlines are on the lattice-girder principle. The filled-in ornament to the spandrels of the arcade between the two divisions of this station is of a commonplace description, and the columns carrying them, which come in the middle of a not too wide platform, appear to be somewhat in the way.

(To be continued.)

SCOTTISH WATER-COLOUR PAINTERS.

THE annual dinner of the Royal Scottish Society of Painters in Water-Colours was held on the 1st inst. Sir Francis Powell, president of the Society, was in the chair.

Mr. Fleming proposed the toast of "The Royal Scottish Society of Painters in Water-Colours." Having mentioned that the Society had been in existence for seventeen years, he said they were all much indebted to it for what it had done. Twenty-five years ago water-colour painting was scarcely known as a branch of national art in Scotland. The Society had exercised a stimulating and encouraging influence upon our young artists, with the result that there had developed in Scotland a school of water-colour painting which in some respects, he believed, was not surpassed by any water-colour society in the three kingdoms. The products of the Society were purely Scottish. They had a charm peculiarly connected with themselves. They were executed by Scotchmen, they were on Scottish soil, and they somehow had got somewhat of the very atmosphere of Scotland in them. Another thing about the Society was its exhibitions. They were good for the

members themselves, for it was in them they could see the work of their neighbours. Possibly the first effect was somewhat to humble them. Sometimes, however, this was a good thing—where it made the artist go away stimulated and encouraged to put more energy, and at the same time more patience into his work as the outcome of the visit. We lived in an atmosphere of education. It was everywhere. Especially now there was higher education. His experience of education had been got in connection with the School Board. He often thought that exhibitions such as that one exercised a far more powerful influence on public taste than they were apt to recognise. He was inclined to envy the population of a town which perhaps had better opportunities of visiting exhibitions. Possibly the public of Glasgow did not recognise the Society as much as they ought to do. It was impossible to forget that the highest lady in the realm had recognised it by giving it a royal charter and the President the honour of a knighthood. Had Sir Francis Powell lived in the days of chivalry he would have been one of the foremost knights. The Society, as he had said, had only been in existence for seventeen years. Comparatively short though the time was, some of the best of the members had passed away. But there was some of their work now on the walls of the exhibition. He fancied that could they have visited the Fine Art Institute that night they would not have desired anything better than to be acknowledged by the members of the Society. He trusted that the exhibition would be in every way a success. So far as he had heard or been able to see, it was essentially a success in the highest sense of the word—that was, in its art relation. It was to be hoped that the public would appreciate it, and that they would visit it at least once. He was sure that if they did so they would come again. The exhibition had been indebted to one or two gentlemen in particular, whose names he would specially mention. There was the former president of the Society, Dr. Blatherwick. Then it was impossible to forget the chairman, Sir Francis Powell. He was always ready, sometimes at great sacrifice to himself, to do what he could to help the Society forward in every shape or form. There could not be the slightest doubt that the high position which the Society had attained was largely due to the influence and energy which Sir Francis Powell had exerted.

Sir Francis Powell, in replying, said that for himself and on behalf of his colleagues he thanked them for their warm response to the toast Mr. Fleming had proposed in such generous terms to the Society, and in much too flattering expressions regarding himself. He was deeply sensible of the honour conferred by his colleagues in their continued confidence in his presidency, and of the dignity bestowed by Her Majesty, to merit which was his earnest endeavour. But there were other members of the Society who had done excellent work who deserved recognition. Besides the gratitude they owed to the Council and committee of arrangement, he might venture to mention their honorary treasurer, Mr. Brown, whose indefatigable energy had been invaluable. Neither must they forget their active secretary, Mr. Robb. The service he had rendered to the Society was far beyond his official duty. Mr. Fleming had kindly said that the exhibition was the 'high-water mark.' He hoped it was. It was also their high tide. He thought the exhibition presented features different from any previously held by the Society, for not only had they pictures by honorary members and outsiders, but they had also, thanks to the generous aid of friends, patrons and the fine art committee of the city magistrates, been enabled to exhibit pictures by deceased members, and some charming examples of the early masters of the art—viz. Turner, Cox, De Wint and Barret. The Society was catholic, favouring no school or style in particular, and in viewing the gallery they might see side by side the impressionist and the classic, the realist in juxtaposition to the romanticist. The exhibition presented a larger field for study than any they had had. To him it was most interesting and instructive to see the various styles and methods of the men past and present, though it must always be borne in mind that the loan and old pictures were selected specimens from the work of an artist's lifetime, whereas the others represented the year's efforts without much restraint. It seemed to him that where the better present men had advanced was in the decrease of a certain hardness, or tightness, to use a professional expression, and there was also a fuller richness of colour apparent and more realism. The exhibition also had another very marked feature, which was the excellent and beautiful drawings by their new honorary members, which shed quite a lustre around; and also there were some by their old *confrères*, which brought to them quite the light of other days. He thought it was pleasant to see these pictures side by side with their own; it was quite a treat to have them, they were like old friends come back again, and they appreciated it most thoroughly. There was another point in the exhibition; they saw the advance somewhat that had been made in many technical points of water-colour. No doubt a greater experience of the medium and its resources had led to this, for though the oldest form of painting—its birth

had been unrecorded in the most ancient history—yet its development until its initiation in England some century ago had been dormant, and to Britain had been reserved the proud distinction of revivifying this most beautiful art, in which they were now pre-eminent. No Frenchman, no German, no Italian, no Spaniard had excelled our best men, and though in oils our laurels were disputed, in water-colour painting the crown was ours. It should be the pride of every Briton to foster and encourage this national art in which we were at present so unrivalled and which was so replete with charms, for where could they get such pure, such beautiful, such brilliant colour as by a wash of pigment over pure, good paper? Try to match it in oils and their efforts would seem dull and heavy in comparison with the luminosity of the older medium. And besides, where could they get such atmosphere in a picture in any other medium as they could in water-colour? Sir Charles Robinson said that water-colour painting was the essential and most perfect vehicle for the expression of the great school of English landscape-painting, and he believed that as taste became cultured water-colour would year by year be felt and proved to be the most lovely and refined process of rendering the artist's impressions of nature and of beauty.

ROMAN REMAINS IN BERKSHIRE.

THE Reading Museum has been lately enriched by several additions to the collection of remains found at Silchester. An explanation of them was lately given by Dr. Stevens, the hon. curator, to members of the Berks Archaeological Society and others. He said that the cases contained many things which were more British than Roman, although they were called Romano-British. Although the Romans subdued Britain and were associated with the country—their legions occupying various districts and there being intermarriages between the Romans and the Britons, and settlements therefrom to some extent taking place—it should not be considered that they colonised the country in the way that we had colonised Australia or America in the present day. He described the character of the different animals remains of which are to be found in the museum, particularly pointing out that the skull of the dog represented such animals as are to be seen on Roman Samian ware. He also pointed out that some of the bones and tines from the horns of the stag, such as are in the museum, were made into knife handles, guards, spindle-whorls and other articles used in daily life by the Romano-Britons. Dr. Stevens next stated that though some flint implements had been found at Silchester they could not be Roman in their origin. He exhibited some specimens which had been used as strike-lights, after the manner of the strike-lights used at the beginning of this century. To illustrate that these were strike-lights, a similar form of flint implement, found on the Hampshire hills, was exhibited together with a piece of iron pyrites which, containing sulphur, produced fire when struck with the flake. The material used to cause the ignition was dried puff-balls of fungus, such as may be found on the downs. Dr. Stevens also said it could be demonstrated with regard to the Britons that they had precedence of the Romans in the use of the clay found on the coast of Norfolk, known as Kimmeridge clay. The clay when dry was turned on the lathe by the Romano-British people into various objects, such as bracelets, spindle-whorls, small vessels used at the table, toilet objects, small trays, &c. Long, however, anterior to the coming of the Romans the Britons used the same clay, together with jet, which was another material employed by the Romans to make small personal ornaments, some of which had been found in their homes and burial-places; indeed, if the common Romano-British pottery found throughout England were examined it would be found that some of the vessels were ornamented with British designs, while on other pots made with the same kind of material Roman designs, such as an elegant scroll, would be seen. Vessels of this nature were pointed out, after which specimens of some of the rarer pottery to be found throughout England were exhibited—pottery which was manufactured at Broseley from clay obtained in the Severn valley, and containing such designs as are to be seen on the finer Samian ware, which was strictly of Roman production and therefore called imitation Samian ware. This fact, Dr. Stevens pointed out, showed that the Romans in their art went even beyond their own date, the moulding of some of the vessels of their finer Samian ware being of Greek origin. Sundry other articles in illustration of British and Roman art were then passed in review, and the demonstration terminated with a description of the methods by which the Romanised Britons prepared their corn for bread-making. The first illustration was found at Silchester, which was essentially a hand-nealer of British origin. It was a large pebble for the hand and was used with a sandstone basin after the manner of the present mortar. The next method of preparing corn was similar to that mentioned in the Scriptures, where it

was stated that two women shall be grinding at the mill and one shall be taken and the other left. This method consisted of a concave stone which worked on a convex under-stone. A hole in the top admitted the grain, and the top stone being turned by a handle the grain came out of the sides on a cloth. It could be readily seen that from this simple apparatus all the after methods of meal grinding proceeded, for if to a heavier pair of grinding-stones a shaft were added the turning could be carried on by means of a handle after the manner of the common grindstone, or by multiplying the power by means of wheels, and adding sails or a wheel at the end of the shaft a simple form of windmill or watermill might be obtained. During the demonstration two British coins of rude character were exhibited which, Dr. Stevens remarked, were to be attributed to British rather than Roman times.

A vote of thanks was passed to Dr. Stevens.

Dr. Stevens, in replying, intimated that he was about to give up the more arduous part of his duties as curator. He had found the rooms empty, and had brought the collection to its present condition. The museum was collectively of great scientific value, and he believed it was appreciated.

SAFETY OF HIGH BUILDINGS.*

SEVEN hundred and fifty years ago a little knot of architects were busy with the solution of a new problem. All of them had been educated under the same conditions, had been taught the same rules, had copied the same models and studied the same methods of construction. Now, to all of them, almost simultaneously, had been presented a new set of conditions which must be fulfilled, but in the fulfilment of which the models upon which their instruction had been based gave them little assistance. Those models expressed by their thick walls, heavy piers, horizontal lines, and small, round-arched openings, solidity, calm, dignified seclusion and aristocratic sanctity; and now had suddenly arisen in the community a fever of revolt against aristocratic and sacerdotal exclusiveness, a passion of democratic feeling, to which the narrowness and heaviness of Benedictine architecture were intolerable. Everywhere was heard the demand for air, space and light, for vast, bright, open halls, in place of the gloomy monastic churches in which the laity, for five centuries, had been permitted only to listen, from behind a screen, to the prayers of those holy persons whom alone the Saviour of mankind permitted to approach His altar. In one word, the modern spirit had been born and upon a few men had fallen the task of expressing it in architecture. You all know how they acquitted themselves of this duty; how, starting with the necessity before them of providing vast and lofty buildings with slenderer supports and larger windows than had ever been seen before, they not only completely satisfied these requirements, but almost within one man's lifetime developed a style of architecture absolutely new, even to its smallest detail, and in this style produced buildings which, speaking to architects trained to appreciate many sorts of architectural beauty, I will not call the most beautiful in the world, but which may be justly described as the most interesting in the world, through the richness of artistic feeling which shows itself everywhere in them.

A comparison of the last decade of the nineteenth century with the era of the emancipation of the communes may seem historically unwarranted, but architecturally there are some striking points of similarity. With us, as with the people of Paris and Amiens and Rouen toward the end of the twelfth century, buildings of the sort that our grandfathers erected no longer serve our purposes. It is true that we can use their dwelling-houses comfortably enough, but for the occupations and amusements which we carry on in common with other people we need, and must have, stronger, lighter, more wholesome and more enduring structures than any known to our forefathers. An economy of time must be practised to the utmost in our modern system, each sort of business must be as far as possible localised, and this involves collecting near a given spot as many persons whose interests are connected with that locality as can safely be accommodated, this requirement alone bringing us inevitably to the modern high building, with its many storeys and its swift-running elevators, standing upon a lot whose situation alone gives it fabulous value.

Notwithstanding all that has been said in ridicule of the "sky-scrapers," there is no doubt that these high buildings meet a need that has been urgently felt, and will continue to be felt more and more in our large cities, and, however conservative we may be in our notions of the virtues of six storeys of solid wall, we all know that the buildings that the age requires, standing on land worth two hundred dollars a square foot, must be made with protected metallic skeletons, and we have probably prepared ourselves by earnest study of the

* A paper by Mr. T. M. Clark, read before the American Institute of Architects at their Twenty-eighth Annual Convention.

subject to make the best of the new construction, whether it appeals to our artistic sympathies or not. That it should at once appeal to our artistic sympathies is not particularly to be desired. The people who cast off the old love with most alacrity are not those who gain the firmest hold on the affections of the new one, and a regard, based on an appreciation of the many excellent qualities of the new architecture, will be the best foundation for an esteem which we may hope will hereafter find artistic expression.

Among these excellent qualities the greatest ought to be, and will be, if architects choose to have it so, the security of the modern high building against fire. As a rule, fire-engineers are disposed to condemn those already erected, for the reason that they are so lofty that streams of water cannot be thrown into them, and so incautiously built, in many cases, as to present an immense mass of fuel in a condition for burning comparable with that of a pile of kindlings built up in a chimney. And they are certainly justified in their criticism; but there is no necessity for filling these blast-furnaces with woodwork, and where the architect is allowed to apply his knowledge, it is easy to make the protected skeleton of fifteen or twenty storeys not only safe against injury by fire within, but extremely valuable as a bulwark against the course of conflagrations outside it. In the presence of so many of my brethren much better qualified than myself to treat of the details of the new construction, I will not presume to point out the methods which architects should follow in carrying out designs of the sort here considered, but it will do no harm to suggest certain possibilities, in the way of application of materials, which may contribute in new ways to the diminution of the fire-hazard. It is well understood by architects that no building, however constructed, is safe against fire unless the amount of combustible material contained in it is either very small, or is divided into small portions by incombustible partitions; and it is also well known that a building, very safe against internal hazards, may be destroyed by the attack of a fierce conflagration from the outside. Great as has been the progress in the art of incombustible construction within the last ten years, there is still much that can be done with materials already at hand in fortifying our lofty buildings against both internal and external risks. Where the fireproof building of ten years ago had its partitions set with wooden studs, filled in with blocks of hollow plaster or porous terra-cotta, and its wooden doors and windows trimmed with wooden architraves, the modern structure is divided by partitions of cement, on metallic lath, held by uprights of channel or angle iron, or of wrought-iron pipe, and, in many cases, provides iron frames and casings for its doors and windows; and the fireproof building of the future will undoubtedly add to these either doors entirely of metal and glass, such as are made in Germany and occasionally here, or of wood covered with sheet metal, in the manner recently introduced, which gives a light, handsome and perfectly incombustible door at a very small expense.

With marble floors on concrete or terra-cotta arches between iron beams, plenty of partitions of iron and cement, metal-covered doors and windows hung in iron frames, and bases and wainscoting either of marble or of metal-cased wood, the internal hazard of the high fireproof building can be reduced to almost nothing, as a fire in one room could not spread to the next. There is, however, the external hazard still to provide for, and here also there is still some progress to be made. Obviously the most vulnerable point in such buildings is to be found in the windows, which, as at present made, offer no resistance whatever to a fire outside. For skylights we have found in the new wire-glass a material at once transparent and fire-resisting, and there seems to be no reason why a similar material should not be used in the windows in the vertical as well as the horizontal walls. Of course it is not to be expected that the tenants of a great office building would be satisfied with the ordinary wire-glass for their windows, but there is nothing to prevent us from designing the most beautiful lace-work of which we can conceive, and having it executed in gilded or silvered wire and embedded in the polished plate-glass of the windows of our "sky-scraper" buildings. Such treatment, whether the tenants liked it or not, would add greatly to the external appearance of such buildings, and would render them practically secure, no matter how numerous or ample the openings, against fire from the outside, as the glass, held by the wire network, would keep its place until it was melted away.

Again, we are told by the fire-engineers that the brick and terra-cotta with which we clothe the steel skeleton of our new buildings are liable to destruction by the combined effect of heat and water, and that when exposed to a serious conflagration, either from the inside or the outside, they are likely to fall off and expose the steel structure. Experience has shown that there is truth in this, but it does not follow that high building must be condemned in consequence. Our Mediæval brethren, in attempting to adapt their old round-arched models to their new conditions, found that their buildings generally fell down. Did they for this reason desist from their attempts to solve the problem imposed on them? No. They knew as we know that

the problem must be solved, and to solve it they at last invented a form of arch which had never been seen before since the beginning of the world. So strange and outlandish did this arch appear to them that for years, although they were compelled by constructive necessity to use it, and did use it with great skill, they disguised it so that no one should notice that their buildings contained anything but the round arch of their forefathers. In the same way, if brick, stone and terra-cotta cannot be made to protect efficiently the metal framework of the buildings which we are trying to make fireproof something else that will accomplish this object will assuredly be employed, no matter how much our traditions may have to be upset for the purpose. For example, there is no practical reason why a steel skeleton should not be clothed first with cement-mortar on iron lath, and then cased entirely over with copper, or brass, or aluminium rivetted at the joints. With a little grouting between the steelwork and the casing to give a substantial backing to the sheet metal, a building of this sort would be almost indestructible. Fire and water would expend their force upon it in vain, centuries of exposure to the weather would only increase the beauty of its patina, and if well anchored to the ground and cross-braced with moderate skill no earthquake could bring it down. It would be a queer-looking affair, no doubt, and the critics would have plenty of sport at its expense; but we may remember in our efforts to accomplish by the light of our own intelligence the results that are required of us, that it was the ugliest of the ducklings that grew up to be a swan, and that in the solution of the most important, most difficult and yet most imperious problem that confronts us certainly lies, to a great extent, the future of the art of architecture in America.

TESSERÆ.

Gothic Mouldings.

GOthic architecture revelled in the use of mouldings, not only what are usually called ornamental mouldings, such as the dog tooth, the ball flower, &c., but also the plain continuous lines of light and shadow, though they are in effect identical, since the former are nothing but serrated ridges, more or less rounded and modified from the first process. Every door, window, monial, every edge vertical or horizontal, every band, string, groin rib, roof label, arch and jamb, whether of wood or stone, internal or external, was generally moulded. Of course, the effect produced by so free and extended a use of them was magnificent. Construction gained thereby a rich perspective, a depth of shade, an tempering of bare prominent outlines, a fine tone, which arrested the eye and made it dwell on certain parts of higher pretension and more exquisite elaboration than others. And yet mouldings are merely the ornamental adjuncts, not the essentials of architecture. Some buildings of the best periods were quite devoid of mouldings, whence it is evident that they are not necessary even to a perfect design. Boldness and simplicity produce effects, different indeed in their kind, yet not less solemn and striking than richness of detail. But the power of mouldings was appreciated to the full by the ancient architects, and it is quite evident that they delighted in their extensive use. It was their ambition to work them wherever they could possibly find means and opportunity. Hence it is that such a vast quantity everywhere remains that no ordinary pains are requisite in examining any considerable moiety of them for the purpose of investigating their principles. If the uniformity in their use had not been tolerably strict it had indeed been a hopeless task ever to master the subject; indeed, if there had not been a system of moulding, there would have been nothing to investigate. But so little did the Mediæval masons depart from the conventional forms, that a capital, a base, or an arch mould is often found of perfectly the same profile in an abbey or a cathedral and in a village church at the other end of the kingdom, so that one might almost suspect that the very same working drawing had been used for both, and this, when it is considered, must appear a very wonderful feat.

The Church of St. Sabina, Rome.

The most interesting of the now solitary churches on the Aventine Hill, St. Sabina, was built, as is set forth in a mosaic epigraph over the chief entrance by Petu, a Roman priest of Illyrian birth, in the time of Celestinus (about 418); though Anastasius assigns it to the succeeding pontificate of Sixtus III., and under date 499 it is named, in the acts of a council held by Symmachus, as among the parochial churches of Rome. Most of its venerable features were altered or effaced by that zealous destroyer and renovator Sixtus V., and even the antique atrium, with columns of marble and granite, gave way to modern arrangement when a lateral was substituted to the chief entrance, for communication from without. The fine Corinthian colonnades of Parian marble between nave and aisles, still intact, present one of the very few examples to be seen in Rome

of shafts and capitals correspondent in dimensions and style among such antiques transferred from Classic to Christian architecture. One singular decorative detail may be mentioned. On a frieze carried above the arcades is the series of discs surmounted by crosses, inlaid in coloured marble, intended to represent the fans (rosta) that used to be hung between columns, amidst the folds of richly embroidered draperies with which the church was profusely adorned at the high festivals of the olden time. Over the chief portals, above the long mosaic epigraph, are the figures, also mosaic, of two majestic females in flowing robes, whose allegoric character is expressed in the inscriptions *Ecclesia ex circumcissione* (sic) and *Ecclesia ex gentibus*—almost unique examples of such personification of the Old and New Law, at least in an artistic form.

Religion and Art.

It is a fact to be distinctly noticed that the three arts which have been called formative, architecture, painting and sculpture, received their earliest impulse from the religious principle, and under its influence entered into a union and sympathy which was never afterwards entirely dissolved in either of their two great periods of heathen and Christian development. Art in its higher sense is not the mere copying of external objects; it is the expression of an idea or a sentiment through a material form. This character it derives from its religious origin. The physical wants of life do not possess an interest sufficiently grand and awakening to call it forth; they are satisfied with immediate fruition, and, as if conscious of the meanness of their source, desire no lasting and conspicuous record of their existence. Not till a later period does luxury borrow from the creations of a higher power the lustre that sheds a spiritual grace on its elaborate provisions for comfort and self-indulgence. In the commencement of society, before acquired associations have obscured the primary distinctions of things, it is only a sense of this mysterious relation to the invisible agencies of the universe that seems capable of acting with so much force on the imagination and feelings of man as to give the idea a preponderance over all the impressions of sense, and to impel him to seek relief from the bewildering tumult of his emotions by embodying it in some visible symbol. His intense consciousness of spiritual life peoples the void with forms and acts resembling his own. He fashions the gods in his own image and surrounds himself with a visionary society of great and wonderful beings, whose name he reveres as a talisman of strength, and in whose honour he puts forth all his resources of tentative skill, guided by the unfolding sense of symmetry and beauty. Thus while his own dwelling is confined and unsubstantial, plain and unadorned, just subserving the necessities of shelter, he rears a colossal pile, court within court, for the house of the Divinity, gigantic statuary lining its avenues and guarding its entrance, and the bright hues and strongly-marked contour of incipient design clothing with a mimic life its interior walls. This propensity to express spiritual conceptions in material forms, whether, as in the East, it remain fixed in a monstrous incorporation of the symbolical with the anthropomorphic, or, as among the Greeks, it disengage itself into the purely human, marks a stage in the process of mental development through which all nations have passed, the Hebrews themselves not excepted.

Sheet Lead and Lead Pipe.

The chief applications of lead in its metallic form are for the manufacture of sheet lead for roofing houses, lining cisterns, making chambers for the manufacture of oil of vitriol, for the manufacture of white lead and of lead pipe. The process by which the sheet is formed is simple. It consists in casting a large plate of lead about 7 inches thick and weighing several tons, and passing it between two polished steel rollers until it is rolled out to the required thickness, a point which is regulated with screws by which the rollers can be brought to any distance required. Lead pipe is formed in two ways, one by drawing and the other by pressure. The former process may be considered as a species of wire-drawing. A cylindrical bar of lead is cast in the first instance with an iron core or rod of a certain diameter; when cold this core is removed and a long rod of the same thickness is inserted in its place, and the whole is then arranged in a kind of mechanism which travels along a table and forces the cylinder through a series of rings of steel of gradually decreasing diameter successively presented to it. By this means the cylinder is continually lengthening and diminishing in diameter, but as the iron core undergoes no change a pipe of uniform bore is at length produced. It is scarcely necessary to remark that the softer the lead the more adapted it will be for making lead pipe by drawing in the way just described; in fact, it is only refined lead that can be advantageously employed for that purpose. The great disadvantage of this process is that the pipe, although in other respects perfect, cannot be made in lengths exceeding 20 or 30 feet. But by what is called the pressure process not only can a pipe of any length be produced, but any kind of lead, hard or soft, may be used. If we suppose a cylindrical iron chamber

with a bottom which moves up and down air tight in it—a kind of piston, in fact—and that on its top is placed another cylinder of much smaller diameter into the upper orifice of which can be fitted a series of rings of different diameters, and in the axis of which and of the smaller cylinders can be placed a sort of core or iron rod of any desired thickness, and if the lower cylinder be filled with melted lead very little hotter than its fusing point, and that we now force the piston in its bottom upwards, the melted metal will be forced into the upper cylinder, where it will become so far cooled that it will become pasty, and on the pressure of the piston from below being continued will be driven in a solid form through the ring forming the open orifice of the smaller cylinder, and will issue out in the shape of a long rod of the same size as the ring. In passing through the small cylinder and ring, however, the semifluid metal will surround the iron core or rod which is placed in the axis of the cylinder, and the rod in passing out will be hollow; will be a lead pipe, in fact. In practice the lead pipe thus made is carried up to about 10 or 12 feet to allow it to cool sufficiently, and is passed over a wooden pulley or drum, and then wound into a coil on a kind of windlass. The piston which forces up the lead in the large cylinder is attached to the ram of a hydraulic press worked by water or steam. The cylinder in which the melted lead is put usually contains about 3 cwt. of metal, and in order to keep so large a mass sufficiently fluid it is surrounded with a jacket of sheet iron, in which a small fire is made. The length of pipe which can be made in one operation is determined by the quantity of lead which the large cylinder or reservoir can hold.

Clay for Brickmaking.

The most important point connected with the manufacture of bricks is the selection of the clay. In the case of common bricks they must be hard and capable of bearing pressure, without at the same time being heavy. One class of bricks may, taken singly, be capable of bearing a much greater pressure or weight than another, but being much heavier, this advantage may be lost by the counterbalancing drawback. They must not fall to powder or crack on exposure to wet or frost, and must be quite free from foreign matter, such as iron-pyrites, nodules of limestone, roots of plants or pebbles. If iron pyrites exist in the clay it will burn in the kiln into oxide of iron when the heat employed is high, and will thus leave a kind of cavity in the brick; with a moderate heat a kind of basic sulphate of iron will be formed, which will rapidly decompose under the influence of air and water and tend to disintegrate the brick. Nodules of limestone will be burned into caustic lime and by subsequent moisture becoming slaked, their expansion will injure the brick and assist in its decay. The presence of vegetable matter will leave cavities in the bricks when burnt and will cause large numbers to fly in the firing. The more plastic a clay is, or, in other words, the purer it is the more will it contract in the firing. This fact has a double importance to the brickmaker. In the first place, a very fat clay, as rich plastic clays are called, will yield exceedingly dense bricks, and are not therefore the best adapted for forming the most serviceable bricks. And in the second, very few clays are homogeneous, the upper part of a bed being in many cases fatter than the lower, a fact easily accounted for, as a mixture of sand and clay suspended in water and allowed to settle will deposit a large portion of the sand first and the finest clay last. If therefore the clay employed in brickmaking be not uniformly mixed, one part may be fatter than another, and the brick in firing will contract unequally. The chemical composition of a clay is also of great importance in judging of its quality. The presence of lime up to a certain point is not injurious, provided it does not exist as pebbles and that it is uniformly distributed through the mass; indeed an addition of lime to fat clays is an advantage. A clay which alone might not be well adapted for brickmaking may be improved by the addition of certain substances, such as lime-sand, or by admixture with other clays of different qualities. Indeed it rarely happens that any clay possesses naturally all the necessary qualities for making good brick, and a skilful manufacturer will always know what materials and in what proportions must be added to render his clay suitable. Thus, in the neighbourhood of London, the very fat clays are mixed with coal ashes or with sand. And in Paris refuse slaty coal is used, as the slaty parts of the anthracite beds are in America. Freshly dug clay does not make good bricks, even when it possesses all the necessary qualities to which we have alluded; it requires to be aged, that is, exposed for a considerable time to the action of the air, which appears to produce some chemical change in the mass. This agency is very much hastened by the action of frost, exposure to frost for a few days being more efficacious than a year's exposure to ordinary weather.

Mr. W. B. McCabe has been appointed assistant engineer on the Dublin Waterworks. The salary commences at 250% a year, rising to 350%. There were sixty-eight candidates.

NOTES AND COMMENTS.

IN the memoir of the late Mr. JOHN WALTER which appeared in the *Times*, it is said:—"In its material surroundings it may be said of him, as was said of AUGUSTUS and his influence on Rome, *invenit lateritiam, reliquit marmoream*. The dingy little office where the *Times* was first produced has given place to the spacious building which now surrounds Printing House Square and faces Queen Victoria Street with an imposing front. The new offices in Printing House Square were constructed, like his own residences at Bearwood and in London, mainly from his own plans, and entirely or almost entirely from bricks made on his estate and from woodwork fashioned in his own private workshops; for Mr. WALTER had not only a passion for bricks and mortar, but a very marked capacity for architectural design. So much interested, indeed, was he in architecture and in London improvements that he used sometimes to say that the only office he would ever have accepted from any Government was that of First Commissioner of Works. In this connection an anecdote may serve to illustrate the determined character of the man, while it reveals a remarkable hereditary trait. During the building of Bearwood the bricklayers employed struck work. Mr. WALTER, like his father, was not the man to be beaten by labour troubles. He at once mounted the scaffolding and began to lay the bricks with his own hands. 'You see I can get on without you,' he said, turning to the men on strike who were watching him; 'it will take a little longer perhaps, but I shall get it done in the end.' The men returned to their work forthwith, and there were no more strikes at Bearwood." It is not easy to arrange accounts when a client supplies some materials and workmanship. An unfortunate lawsuit between the proprietor of Bearwood and his architect exemplifies that fact, as well as another, viz. that in technical cases the lawyers are sure to gain more than the successful litigant.

THE arrangements for the 141st Session of the Society of Arts are now announced. It commences on November 21 with an address from the chairman of the Council, Major-General Sir JOHN DONNELLY. The first regular paper of the new session will be by Mr. HIRAM MAXIM, on his "Experiments in Aeronautics," and this will be followed the succeeding week by one by Mons. HERMITE, on "The Electrical Treatment of Sewage." Two other papers—one by Mr. THOMAS WARD on "Salt," and one by General MICHAEL on "Forestry"—will be read before Christmas. A number of papers for meetings after Christmas are also announced. Six courses of Cantor lectures are promised, of which the first is by Professor VIVIAN LEWES on "Explosives." There will be as usual a course of Juvenile lectures after Christmas; the lecture this year is by Professor VERNON BOYS, his subject being "Waves and Ripples." The meetings of the special sections for the discussion of matters connected with India, foreign countries and the colonies, and applied art, do not commence until after Christmas.

AN innovation in the manner of upholding respect for by-laws was attempted a few days ago in Walsall. Five houses and a shop were erected without a damp-course. Instead of the owner or builders Mr. ROLLASON, the architect, was summoned. The town clerk maintained that as the architect gave the notice to the authority he was the person erecting the building; but if he were not so generally, the effect of the notice which the defendant had served would make him so in the case. In support of his view a printed note appended to the notice was referred to, which stated, "Further, I will make myself responsible for the work being carried out in accordance with the by-laws." The architect's representative contended that the defendant was not the person responsible under the by-laws. Being in the nature of criminal statutes, inasmuch as they imposed penalties, they must be construed strictly or literally, and the words "the person erecting the building" must be understood to mean the person actually doing the work or someone acting as his agent. It could not mean either the owner or the architect.

As soon as the defendant's attention was drawn to the fact that the damp-courses were not in he saw the contractors and wrote the borough surveyor, stating that he had called the attention of the contractors to the matter, and that the latter would no doubt attend to it before the buildings were completed. The magistrates dismissed the summons, but consented to grant a case for the consideration of the Court above on the application of the town clerk, who said a decision on the point raised would be of great importance to the local authorities. It will be no less important to architects and builders.

THE Budget Commission of the French Legislature have been investigating the outlay on the teaching of art, in the hope of introducing a more economical administration. M. LEYGUES, the Minister of Public Instruction and Fine Arts, has given evidence. He has succeeded in persuading the commission to allow the votes for central administration, inspectors of art, inspection of schools, and whatever relates to the application of art to manufactures, to remain undiminished. But a Budget Commission that could not point to retrenchment would be a failure. Accordingly it has been resolved to refuse the vote for the small sum of 600*l.* which is needed to remunerate the professors in the Paris Conservatoire, and to enable additional classes to be opened. In that case the industrial results are supposed to be less manifest.

WHEN MARIE ANTOINETTE came to be installed at Versailles she took possession of the part which had been inhabited by MARIE LECZINSKA. It was at the time decorated in the Louis Quinze style, as the style of the preceding reign, which was generally employed in the palace, was considered old-fashioned. MARIE ANTOINETTE, in turn, ordered the style which was in vogue to be employed. One exceedingly small ante-chamber which separated the king's rooms from the queen's escaped the transformation. The woodwork was an exquisite example of Louis Quinze ornamentation. But the little room was obnoxious in the eyes of LOUIS PHILIPPE's restorers when they were operating on the palace, and it was covered with a thick coating of whitewash. Some days ago an attempt was made to remove the whitewash, and during the progress of the work some beautiful painted ornament was found. In consequence, the removal was ordered to be executed with the utmost care, and there are hopes that the ante-chamber will once more resume the appearance it presented when MARIE ANTOINETTE became the tenant. There is so much vastness about the rooms in Versailles, a small enclosure of the kind would be a welcome sight to visitors.

IN 1899 will be the tercentenary of the birth of VELASQUEZ. The Academy of Fine Arts in Seville contemplate a celebration of the event. It is proposed to have a competition for an essay on the life and works of the great painter. A medal is also to be prepared which will bear a portrait of VELASQUEZ, and a marble tablet will be placed on the house in which he was born. Is it not remarkable that Spaniards should so tardily be convinced of the honour which accrues to them from having VELASQUEZ as a countryman? If it were not for foreign nations his memory would have perished in Spain. The first to reveal the greatness of the artist was the German painter and writer RAPHAEL MENGES, who in 1776 wrote an epistle, which is printed in the sixth volume of the "Travels in Spain," by Don ANTONIO PONZ, upon the pictures in the palace of Madrid. According to MENGES, the best models of the natural style or the imitation of nature are the works of DIEGO VELASQUEZ, and he maintained that if TITIAN was a better colourist, the Spanish painter far surpassed him in light and shade and in aerial perspective. MENGES was particularly attracted by the *Water-Carrier of Seville*, the *Bacchus*, *Vulcan's Forge*, the *Spinners*, the portraits of *Margaret Mary of Austria*, *Philip IV.*, *Oliveres*, the *Capitulation of Breda*. "If anybody," said MENGES, "wishes for more perfect work, it must be sought in nature, and not in painting."

THE DECADENCE.

THOMAS COUTURE.

ILLUSTRATIONS.

THE ROMANS OF THE DECADENCE.

AMONG all the thousands of paintings which have been produced in France during the century, there is not one which is more likely to be accepted hereafter as a worthy companion of GERICAULT'S *Raft of the Medusa* than the *Romains de la Décadence*, of which we give an illustration. Both works have defects, especially in colouring, but they have that mysterious impressiveness which makes hypercriticism appear as insignificant. Both were produced by young artists. GERICAULT was twenty-eight when he exhibited *Le Radeau de la Méduse* before his countrymen, who were unable to appreciate its power, and what recommended it to Parisian amateurs was the admiration it received in England. COUTURE'S *Romains* was the work of a man of thirty, and it was received with apprehension rather than with admiration. It was instinctively considered to be a warning of coming calamities, ominous as the handwriting on the wall, for the Roman debauch was only a symbol of Parisian life. Accordingly the critics put it under the microscope in order to discover sins of omission rather than commission. Where, asked MAXIME DU CAMP, are the gladiators who fought at the feasts or the dwarfs who used to seek after the withered wreaths? Where are the psyllæ who played with serpents, the Greek poets who sang the praises of the guests, the rope-dancers, the lampreys in crystal globes, the relays of slaves who bore Cretan wine? The picture does not correspond with the "Satyricon" of PETRONIUS, nor represent all the details of the feast of TRIMALCION, therefore it is not a historical painting. The critics were unable to perceive that, by force of the insight which belongs to genius, COUTURE summarised in one work a series of descriptions of the degeneration of a great race through an excess of unrefined luxury. GIBBON said that the manners of the Romans, previous to the fall of the Empire, had been made the subject of minute and laborious disquisition; but as he was restricted by the limits of his work, he preferred to confine himself to what had been said by AMMIANUS MARCELLINUS. If COUTURE'S work existed in the eighteenth century, the English historian would be sure to recommend his reader to study it as an epitome of a time when "the greater part of the nobles dissipated their fortunes in profuse luxury, found themselves poor in the midst of wealth, and idle in a constant round of dissipation." In the picture we see men who were preparing themselves to be the victims of ALARIC, who was to compare them to hay—"the thicker the easier mowed"—and to be amused by their menaces.

COUTURE was treated as a croaker, and was not allowed opportunities to make Frenchmen uncomfortable. On his side he was too proud to produce works which he thought would be a renouncing of principles. He withdrew more and more from Paris life until he was at last considered to be an ancient master belonging to some indefinite period. People wondered to see his colossal picture in the Luxembourg among the works of living painters. In 1878, that is, a year before the artist's death, a correspondent of *The Architect*, who was puzzled by the uncertainty which surrounded COUTURE'S name, courageously resolved to inquire about his fate, and the following graphic account of an interview with the painter reveals the bitterness of a man whose powers were undiminished, but who could say with TIMON—

My long sickness
Of health and living now begins to mend,
And nothing brings me all things.

The tub in which it was the good pleasure of Diogenes to live was not a greater contrast to the palace in which Alexander dwelt, than the home of that Nestor of Art, Couture, and the ateliers of the present generation of artists. The most inaccessible of human beings, and yet a genius so undeniable that it would be impossible to consider a review of Paris studios complete unless his were included, the question arose—how obtain admittance to his house, and where is it? To these inquiries, the reply of men who are yearly exhibitors and who know the artists' world *au bout des doigts*, was, in more than one instance, "Couture's home! *Mon cher*, he is dead, ages ago; a great man in his day, but Couture belongs to the past." Not so, however, among his friends and devoted adherents. One of these called for me yesterday. Along the Champ-

Elysées, crowded as all such fashionable promenades are on New Year's Eve by the great world; past the Rue de Rivoli, thronged by Parisians, selecting from the glittering productions of art and industry their last *drewnes* for the one *fête* of France, *le jour de l'an*; past city warehouses, encumbered by bales of every species of manufactured goods for the supply of the splendid shops which convert the boulevards into a world's fair; along narrow streets, such as were once, before the reign of King Haussmann, characteristic of Paris—streets an artist delights in, although inconvenient in the extreme, on account of narrowness, horribly paved, moreover, but picturesque and full of quaint bits of old-world architecture, which Prout, had he been of the party, would have sketched, on to the least savoury among them, and indeed, truth compels me to write to the dirtiest—Rue Geoffroy l'Angevin No. 9—and there my friend stopped. I felt relieved, for it struck me he never would. We ring at a narrow gate, once green painted—a Bretonne appears at the end of a dark corridor. The wooden balustrade of a staircase partly conceals her figure, but the white wings of the cap of her native village attract the only ray of light admitted from the smallest possible lucarne. Yes, M. Couture was at home, so was Madame and his daughters. My friend rapidly followed the Bretonne—a precautionary measure, taken in order that the great man should not have time to frame an excuse for sending us *au diable*. Up the somewhat rickety stairs, along low corridors, down dark passages, we pass until we come to an open door, and a charmingly fresh face and a soft voice greet us, and we are ushered into a room essentially different from any I ever saw in Paris, inasmuch as the floor was of white planks, the tables and chairs of deal, and the walls were whitewashed.

Nevertheless, we were in the presence of the great man. We disturbed him while enjoying a quiet smoke. He wore a grey dressing-gown, and, as he rose to bid his friend welcome, the thought flashed on me—how like Dr. Johnson's portrait. Yet he is a shorter man by many inches, and the likeness is strongest when he is seated. His manner, also, is pre-eminently Johnsonian, as also his dry humour and caustic sayings. It required no small amount of diplomacy on the part of my friend to induce the old man to receive your correspondent *en qualité de correspondant*. "You have come," he said, "to visit my atelier? You have seen others?" I answered in the affirmative. "Well, then," he said, "you write to *The Architect* that Couture paints without an atelier. He does his work by machinery. He has a mould; he puts his ideas into it; gives it a shake, and the trick is done." This was promising. "Sir, you don't seem convinced. Well, I will tell you another system. Couture takes a telescope; he turns it the wrong way; he draws what he sees at the small end. 'Atelier,' sir, never had one in my life. Couture is dead, he exists no longer."

At this juncture the portrait of a girl met my eye. I asked was it one of his daughters. The old man at once plunged into the subject of the splendid head which had attracted my attention. No, it was not of his daughter. It had been painted thirty years since. It was called *La Commère*. The young girl had been godmother with him to the child of a friend, and he had painted her. The portrait had been purchased by an amateur in Holland, who had died two years since. Couture commissioned an agent to purchase it at the sale which took place of the Dutch gentleman's property. The price was beyond him, 200*l.*, and the agent let it go, but its second purchaser, on hearing that Couture had wished to buy his own picture, had courteously lent it to him to copy, and thus it hung on his wall. "Voyons," he said, with something which might have been meant for a smile, "you would like to see something else of mine, but my pictures are all over Europe, most of them are in America," a fact I knew too well. Then said Couture to his wife, "Take monsieur to see the *Wives of the Volontaires*."

We crossed by a wooden gallery across an inner court, and thence up flights of the narrowest of stairs, to a room in which there was but a single article of furniture, and that an easel, but on that easel a picture worthy of a place in the gallery of a great people. I knew Couture only by his great work at the Luxembourg, *La Décadence Romaine*, and by his book on art study. I confess I was speechless in presence of this superb painting, which is but a fragment of his great picture *Les Volontaires de '93*—a work as large as either of Paul Veronese's pictures in the Salon Carré of the Louvre, and which has been rolled up for the last quarter of a century, but which there is some hope he will be induced to exhibit at the coming Exhibition. Volunteers are starting for the frontier; they carry with them "Liberty," personated by Théroigne de Méricourt, seated on a gun carriage, which by the bye, is of the Louis XIV. period. The wheels as they turn crush symbols of royalty, such as the crown, sceptre, &c.; women hold their children up in the air, and call on the volunteers to defend them. A motley band in truth are the said volunteers—some wear the uniform of the Republic, some the worn-out costume of the day, and some are genuine *sans culotte*.

A few of these men have left young wives to mourn the fate of war, and the picture before us is of two of these—a mere

fragment, as I have written, of the great composition. A woman of say two or three and twenty stands before you; she has gone through the agony of parting; yet her eye is tearless; her dark hair thrown back; her dress a chemise of thick linen, which displays her neck and shoulders, as well as her arm; her petticoat is of striped linsey. On her right shoulder leans, weeping bitterly, a younger woman; her colouring is fair, the hair of the tint of auburn Guido paints; her dress also a low-cut chemise and a skirt of linsey. It is rare to look on such work. There is a solidity, a richness, a depth of colour which comes upon us as a thing of a past age. The flesh has a firmness, a reality, if I may use the term—I do not mean to do so in the term of realism—that astonishes one, accustomed as one is to the railway speed at which a younger generation of artists lay on their colour. The folds of the linen, the thick plaits of the linsey have a density and an amplitude in their heavy folds which make you think of a Rembrandt rather than of any modern artist. Grief too deep for tears is expressed by the one figure, wild despair by the other; and the impression made by this grand work was well expressed by my friend when he uttered *C'est superbe!* We returned to Couture.

In our absence he had evidently reflected on the object of my visit, for he offered me a sheet of paper, and proposed to dictate my letter to *The Architect*. *Je ne demande pas mieux*, was my reply, and he bid me write as follows:—The translation is verbatim.

I set out in search of Couture, and succeeded at last in discovering him in a horrible quartier central, there I found him in a house still more dirty than the quartier—I fancied I should have found the painter in an atelier more or less resembling other ateliers—he was taking his siesta. I explained to him that I wished to write about his pictures, and requested him to be kind enough to allow me to see any he might have in his house. “I am profoundly touched by your solicitude,” replied Couture, “but having all my life dreamt of pursuing art after the manner of the ancients, and having unhappily remarked that men in modern times have degenerated into monkeys, in despair at this change I have had but one desire, and that is to avoid being spoken of by this species or in any way attracting their attention.”

The dictation ended; we induced this most original of types to talk of his works. “In France,” he said, “we have Governments which last a week. ‘The Volunteers’ were ordered by the Minister of one dynasty, and counter-ordered by his successor of the next. I was disgusted. I rolled up my canvas. The last Emperor, Napoleon III., wished me to paint the baptism of the Prince Imperial. His wish was intimated to me by the Prime Minister Fould, who at the same time announced that I had been selected to decorate the newly-built Pavillon Denon of the Tuilleries. I set about the picture of the baptism, and submitted the first sketches to the Minister. He received me graciously, but instead of examining my sketch, began to talk about a picture he wished for his château, and asked me about the price it would cost. In my simplicity I named a price. He immediately changed the subject, and dismissed me somewhat abruptly. I received in a few days an intimation that the baptism must be executed in a manner totally different to what I had conceived. There must be so many chamberlains to the right, so many ladies in waiting to the left, so many princes here, so many princesses there, the Emperor and Empress exactly in the centre. ‘Impossible,’ I exclaimed, ‘Couture cannot paint thus, and they know it. How comes it, that when I received the order I was informed that I was to paint as I conceived the subject, the Emperor had specially sent this message?’ I was too simple. I had not understood that Fould, the great Minister, had expected me to offer him the picture he wanted for his château as a *pot-de-vin*. I refused to paint the baptism, and since have declined all Government orders. *Ce sont tous des farceurs*. People of the world do not understand art. *Ils ne font qu’encaçonner l’art*. We have so many Governments I cannot recollect all I have lived through, but there was one in ’48 which called itself a Republic. The Prefect of the Seine then was Berger. He was revoked, but he wished to annoy his successor, therefore the last thing he did before going out of office was to order me to paint three subjects for the Chapel of the Virgin at St. Eustache, which I did. The new Prefect fell on troublous times. He had too much to do, and forgot to ask me for a *pot-de-vin*, which I should not have given him in any form.”

Couture was born in 1816. He drew and modelled from the time he could hold a pencil. At seventeen he entered as student the atelier of Baron Gros. Subsequently, Couture and Healy studied under Suisse, and from that accidental circumstance sprung up a friendship which has never been interrupted. Of late years Barbedienne has purchased all his compositions, and several of his pictures are now to be seen in the Barbedienne's Gallery, Boulevard Montmartre. Among the works Couture refers to with greatest satisfaction are *Le Duel* and *Circé*. In the former he has thrown all the interest of the scene on the youthful victim, who has fallen by the hands of an old duellist, whose dexterity the witnesses are basely com-

plimenting. The *Circé* is a woman of faultless proportions, seated in a car, to which are harnessed four of her lovers, each representing men of different types and ages. This painting is the property of an American.

QUEEN'S HALL, LANGHAM PLACE, W.

COMPETITIVE DESIGN FOR ST. AIDAN'S CHURCH,
WALTON-LE-DALE.

THE illustrations of this design represent alternative schemes—one with a single arcade (shown in the interior perspective) and the other with the usual arrangement of nave and aisles. It is demonstrable that the piers of a single central arcade “obstruct the view of altar and pulpit” far less than do those placed in the ordinary way, though this is seldom an advantage. The design is by Messrs. EDEN & WILLIAMS, of 3 Staple Inn, and was exhibited this year at the Royal Academy.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of the Institute was held on Monday evening, Mr. F. C. Penrose, F.R.S., president, in the chair.

President's Address.

The PRESIDENT said:—In the opening address of the President in former years you have naturally expected; and have not been disappointed in receiving a general account of the state of the Institute and of its undertakings, especially during the interval which had elapsed since the previous annual address. I think I may say without any exaggeration that the Institute has continued to gain both in position and influence. As to the gain in members without reckoning most welcome support given us by the allied Societies, if we compare the numbers, I will not say sixty years ago—a date of which we were most agreeably reminded in July last—but taking fifty years ago, the increase is remarkable enough to be worth mention. The class of Fellows numbered at that time but little over one hundred; there are now more than six hundred. There were then some eighty Associates only; now there are nearly nine hundred—and this notwithstanding the barrier which has been surmounted by most of the later members, namely, the examination.

I think it is now generally recognised that the examination in architecture has fully justified its establishment; at any rate, it has become a great fact. And it seems important for me to call attention to this point, namely, that the present month brings the former and partly tentative arrangement to a close, and from henceforward begins the system of progressive examinations, the details of which will be found fully set forth in the recently issued Kalendar. I consider that these examinations cannot but have an excellent effect—first, and directly, in securing to our future members the reputation of having satisfied a certain standard of proficiency; secondly, and indirectly, by excluding from the Institute in the first instance and by reaction from the profession at large, young men whose abilities would be more advantageously directed towards the pursuit of some other calling.

I cannot leave this subject of membership without reminding you that the Charter declares the Institute to consist of “three classes of subscribing members, namely, Fellows, Associates and Honorary Associates;” and though both the Fellows and Associates are steadily increasing in numbers, the honorary Associates have been allowed to dwindle from 115 in 1878 to 60 in 1894, a decrease of nearly half, due, I am inclined to think, to a misunderstanding of the objects and principle which dictated the establishment in 1877 of this class of members. I am convinced that the development of this class of non-professional members will greatly enhance the usefulness of the Institute. We should wish to enrol in our honorary Associate class many more painters than are now in its ranks, a large number of sculptors, engineers at home and abroad, the masters of the great crafts, and the more prominent of those thinkers and workers who, by their books and discourses, disseminate love and respect for the several arts and sciences of which the embodiment is architecture.

There is another section of membership of the Institute, pertaining to the non-subscribing class, which has always seemed to me to form an essentially important part of corporations such as ours—I mean the class of corresponding member, or foreign correspondent. At present the majority of such members is distributed over France, Germany and Italy. We have two in Denmark, two in Sweden, two in Spain and Portugal, two in Greece and Turkey, three in Austria, four in the United States of America, five in Belgium and Holland.

Now I want to see Austria and Hungary largely represented in our ranks, and it is gratifying to know that two of the most distinguished architects of Budapest—a magnificent city of which too little is known in this country—are nominated for election. I should be glad to see Austria at least as fully represented among us as Italy is, and I hope that the increasing popularity of Spain as a resort for study among the students of the Institute may lead to an exchange of ideas, a reciprocity of knowledge, between the architects and students of the respective countries. Most, if not all, of the greatest European architects and archaeologists have been correspondents of our body, and even in 1842 they were fifty-five in number, while at present, after the lapse of half a century more or less prosperous, we have only forty-nine. But what is still worse, a startling omission occurs in this list—the architects, archaeologists and similarly learned men of Russia are absolutely without a representative among us. A few years ago we possessed Constantine Thon, Professor Strohm and Professor Resanoff, and in 1842 there was Alexander Bruloff, of the St. Petersburg Academy of Fine Arts. Some attempt I think should be made to renew the ties of confraternal association which have existed, and which ought always to exist, between the architects of the mighty Russian Empire and ourselves. There never was a moment when such a reunion could be attempted with more chance of success than now.

The London Building Act, 1894.

I have almost completed the observations I wished to make upon what may be termed the personal affairs of the Institute. But there is one point to which I think your attention should be directed. I allude to the present position of district surveyors in London.

A new Metropolitan Building Act has passed the Legislature with so many new provisions that it will require much study on the part of those who have to enforce it as district surveyors or to obey it as architects. Under this measure—the London Building Act, 1894—which comes into force on the first day of next year, the Institute still remains the examining body for granting certificates of competency, without which no person can become a candidate for the office of district surveyor in London. This statutory examination, until the present County Council imposed a condition that a district surveyor shall not practise as an architect, was always well attended, and those who presented themselves for examination were generally men who had not only received the education of an architect, but had practised as such. Not long ago this statutory examination was held quarterly, and the examining board had then much to do in order to finish the oral part of the examination on one day. But now very few persons apply to be examined, and during the last official year the two examinations announced to be held did not take place, owing to the want, or perhaps the paucity, of candidates. Yet a district surveyor, if he is to do his duty by the London Council who appoint him, as well as by the architects whose buildings he has to inspect, should have that knowledge of architectural science or building which can only be acquired by an architect who has been engaged for, say, seven or ten years in the active practice of his profession. I will not go into the question whether a district surveyor ought or ought not to be allowed the right of private practice, but I am certain that he ought to have practised as an architect before attempting to fulfil the duties of a district surveyor under the London Building Act. Is there, then, anything unreasonable in the suggestion that the London County Council would be wise in including among the conditions of such appointments the proviso that every candidate for the office of district surveyor in London shall have previously qualified for admission to the class of Associates of this Institute, and have either passed thence to the class of Fellows, or have become admissible by length of practice to that class?

Three Thames Bridges.

We have lately seen brought to completion by our honorary Associate, Mr. Wolfe Barry, a great engineering work with which the late Sir Horace Jones was originally associated as architect. If he had lived to superintend the completion of the design of such parts of it as lay in his department, he would probably have left the towers more massive in appearance than they are. It is, indeed, greatly to be wished that association between architects and engineers, in cases where their provinces overlap, were more frequent than it is. I well remember Professor Cockerell regretting a lost opportunity of the kind in the case of Waterloo Bridge. Sir Robert Smirke had offered his assistance to Mr. Rennie in profiling and adjusting the Doric columns which formed part of the engineer's design, but the latter declined. The baldness of those columns is a serious defect to the beauty of the bridge, which, indeed, would have been handsomer if the columns had been omitted altogether, and one of the good results of the Tower Bridge is that it relieves the necessity of tampering with the noble simplicity of London Bridge.

The Wembley Park Tower, &c.

In contradistinction to works which are satisfactory for their actual or hoped-for achievement, I feel called upon to mention one of which the stoppage would, it seems to me, be matter for congratulation, and to express the hope that no further progress may be made with it, unless it be to convert what already has been done into something far less pretentious than the original intention, which, if carried out, would spoil the scale of everything else for miles around it. I need not explain to anyone here present that I refer to the incipient structure of the huge steel tower at Wembley Park, in the north of London. Possibly, if its lower storeys were turned into something of the nature of the hanging gardens of Babylon, it might be an interesting and unobjectionable structure; but if the original scheme is to be carried through, you will, I think, agree with me in wishing confusion to a new Tower of Babel.

Again, with regard to another point which is not, I fear, so much attended to as it ought to be. It cannot be too strongly insisted upon that when new buildings are erected by the side of old buildings of established architectural merit, the utmost care should be taken that the new works do not injure the effect of the older. I think many of us must have been often much pained in witnessing such injurious treatment of old venerated monuments. I am particularly thinking of the case which our late President so much and so eloquently lamented, namely, the new buildings of King's College abutting with such small consideration against Somerset House, notwithstanding the most laudable attempt of our Council to prevent its being done. Another case of the kind has occurred, but not so recently, at Exeter. There was till comparatively lately, as in the case of several of our cathedrals, immediately contiguous to the west front of Exeter Cathedral a small church, of no remarkable architectural value certainly, but which by its very smallness gave valuable scale to the cathedral. At a later visit I found it had been replaced by a church of much larger proportions, and the merit with reference to the cathedral which its predecessor had was entirely lost. In my opinion, though the wants of the parish may have required the enlargement of the church, there was no occasion for the architect to have so raised the tower and spire as to overtop the venerable cathedral.

"Architecture: A Profession or an Art?"

I shall not attempt to meddle with the controversy which some time since was raised as to whether architecture is an art or a business. The two elements are no more separable than are faith and works; and our teaching to students properly takes cognisance of both. To the art element and the thoughts more immediately connected with it, I propose to confine myself in what I have still to say to-night.

The Threatened Destruction of Philæ the Beautiful.

The original sources from which we derive our art must always have an intense interest for us, and whilst we are in hopeful expectation of new light being thrown upon Greek archaeology from the researches of the French architects at Delphi, under the experienced and skilful guidance of M. Homolle, the director of the French School at Athens, we are not indifferent to grievous tidings which come from Egypt—a strange proposal which, having been more or less vaguely in the air for some time, has recently assumed alarming consistency. I refer to the proposed Nile barrage to be built across the river at Assouan for the purpose of storing up the waste waters of the annual inundation in a huge reservoir, in such a manner as to submerge and ruin a series of the most beautiful and interesting remains in the country. The deluge which is threatened would extend from Assouan as far as Korosko, a distance of fully one hundred miles, forming a lake of which there would be no parallel in Europe, submerging the Island of Philæ, with its celebrated group of temples of the highest beauty and artistic value, and eleven or twelve other important sites, particularly the fine and very perfect temple at Kalabsha. In addition, moreover, to what we know would be lost, it should be noticed that, as the region of Nubia in which they occur has not been so carefully examined as most other parts of ancient Egypt, it is more than probable that many objects which would otherwise reward future exploration if they remained, as now, accessible, would be lost for ever. Again, if anything happened to the dam, what would be the fate of Lower Egypt and all its inhabitants and all its treasures? We need not fear but that the engineers would do their best to make it secure; but sad instances of the failure of reservoir dams, where everything ought to have been well constructed, are not unknown to us, and the region has been subject to earthquakes so violent as to thrown down even Egyptian structures.

The proposal has, unluckily for one point of view, much that is tempting to utilitarian minds, and we are not as a nation exempt from the reproach of yielding in cases where men of business have had to choose between sentiment and prospective

gain. In the case of the Nile barrage we must do the Egyptian Government the justice to say that they would seem to deplore the injury to art and history which would follow; but the premium which is held before them is so large that we may feel sure that any attempt to oppose an absolute negative to the scheme would be simply futile; nor would it be right. Our own Government, again, is doubtless in no enviable position in the matter. If by an exercise of power we were to prevent the work from being undertaken, it is easy to see what a deep and, may be, dangerous feeling of disappointment would arise in Egypt; whilst if they consent to it, our rulers would incur much obloquy both at home and abroad. As for the Island of Philæ, it is true that a scheme has been proposed for lifting up the remains above the surface of the reservoir; but it can hardly have been proposed seriously. It would be ruinously expensive to do it at all adequately, and would quite destroy the value of remains now perfectly adapted to the island on which they stand. Practically, the attempt, if made, could not fail to be worse than submergence. It has been also suggested that a dam of less elevation, placed above instead of below the Island of Philæ, would for a long time answer all legitimate demands for water-storage, and would involve a much smaller sacrifice of valuable antiquities or disturbance of inhabitants; and if at some future time the demand should arise for a larger supply, other means not now available—new sites, for instance, above Wady Halfa—might be found. We may, at least, hope for the escape of Philæ and some other of the Nubian antiquities, and this gradual method of procedure would seem to fit in with the expectations of the proposers of the barrage, for the supposed profits on which the scheme is based are not to flow in at once, but, as Mr. Garstin, Under-Secretary of State for Public Works in Egypt, himself says, the great expectations are founded on an eventual increase “which it will take years to arrive at.” On this subject I would draw your attention to a pamphlet printed by the Society for the Preservation of the Monuments of Ancient Egypt, in which a more gradual method of water-storage is strongly advocated.

Old and New Methods of Design and Practice.

Turning homewards, it may be useful to institute a comparison between some of the results of architectural work of the present between those of an earlier period in this country. In making this comparison we must not lose sight of the great differences in the two periods, both in respect of the demands upon the architect and of the materials available to his hand. The greater complexity of the conditions of modern life is unfavourable to the modern architect in some respects. It requires him to spend a large portion of the funds available for a building in work which, however important, can produce no æsthetic effect, and the many calls upon him to satisfy a variety of wants must necessarily make it very difficult to secure that charm of simplicity and proportion which is an essential ingredient in work of the highest quality; indeed, with so many importunate claimants for attention, the time which must have been devoted to rhythm and harmony by the older architects can now seldom be spared. There is, therefore, a great temptation to accept a premature solution of the problem provided the requirements of the plan appear to be satisfied, and provided the resultant grouping, however haphazard it may be, accords with some idea of picturesqueness which natural or acquired taste can generally secure. I do not, however, venture greatly to blame this result. It is far better that a good plan should command the obedience of the elevation than that a preconceived symmetrical elevation should force the plan into inconvenience. Nevertheless, a more excellent way is almost always possible where the plan shall still rule, but with all the difference between marching order and broken ranks; though, as I said, it may require more time for working out than can be spared in any particular case. Genius has been defined as the power of indefatigable study. Such genius is indeed very necessary for the highest achievements of architecture. There are certain buildings, such as club-houses, theatres, town halls, and, above all, ecclesiastical structures, which lend themselves much more than others to be treated by the rules of art; but there are none, not even the most humble, which may not be improved through study with an eye that loves proportion. It is a duty the profession owes to the public to do this on every possible occasion.

To return to my comparison between the older and later architectural works. There is a point which seems to be deserving of attention, but whether it admits of being to any great extent brought into operation I do not venture to say. The modern architect, owing to the way in which drawings, specifications and bills of quantities are prepared, and the exactness with which contract works are expected to follow out those documents, has seldom if ever the same freedom in studying his design as it develops itself, and in making improvements which suggest themselves as the work goes on, that our predecessors had 200 hundred years ago. The designs made by Sir Christopher Wren for St. Paul's Cathedral underwent great changes during the progress of the building, as there are many

extant working drawings to show. Some liberty, of course, we have by the usual conditions of contract, but the greater rapidity of modern construction, and the fear of additional cost to the employer, limit considerably the free use of those conditions; and this want of elasticity, so to speak, in availing ourselves of opportunities offered by the study of our works whilst in progress, is one of the points on which the older architects had a great advantage over us.

A Permanent Gallery of British Architecture.

Let us now compare the works of some of the older with those of more recent architects. But before doing so I would urge upon those in whose hands rests the power of developing the means of architectural study to consider the possibility of forming a permanent exhibition of drawings representative of English architecture. The suggestion, indeed, is not new, nor is it mine; but I have received a letter on the subject from our Fellow, Mr. W. Howard Seth-Smith, which is so much to the point that I propose to read a portion of it. He says:—

If we are to look for real and permanent progress in architectural design, we must in some way create public interest and enthusiasm for beautiful building. A permanent exhibition would be the very best means of gaining public interest in our art. It is the galleries which have made art more popular. I would propose that a permanent exhibition be organised of most carefully chosen architectural illustrations of the best ancient and modern designs, classified under all the great divisions of building, such as civil, ecclesiastical, domestic, scholastic, &c. There should be one department for photographs of selected ancient work, chronologically and topographically arranged and carefully described. This would supply the urgent and often-expressed want of an illustrated lesson on the characteristics and developments of the great architectural epochs and styles of the past.

I certainly consider Mr. Seth-Smith's proposal one of great importance. To be of any service it would require to be carried out in an effective manner, and if this could be done, it could not fail to be advantageous both to our profession and the public at large.

Returning to my proposition before stated, the list of the architects I propose to refer to begins with the two greatest names on our record, namely, Inigo Jones, who practised in the reigns of James I. and Charles I., and Sir Christopher Wren, who practised in those of Charles II., James II., William and Mary and Queen Anne.

Inigo Jones.

Inigo Jones had settled at Copenhagen, and the King of Denmark's sister, who married our James I., brought him back to his native country. He then travelled for further study in Italy. The beautiful fragment at Whitehall is, as you know, only a small portion of the magnificent palace which he designed for King James, preserved to us, no doubt by the liberality of Lord Burlington, in Kent's fine edition of Inigo Jones's works. Besides the Banqueting House, there are but comparatively few remains of Inigo Jones's buildings in London. We have lately lost a very interesting work of his in Lord Shaftesbury's house in Aldersgate Street, which was taken down about ten years ago. It had already suffered much, but was still a noble fragment. There is also the much-mutilated east front of St. Paul's, Covent Garden, and the Piazza on the north side of the Market; and there is the Water-gate at the bottom of Buckingham Street. This gate, although it retains its beautiful proportions, has lost much of its interest now that it no longer gives access to the river; but its preservation under any circumstances is a thing to be grateful for. A house on the west side of Lincoln's Inn Fields still shows the handiwork of Inigo Jones. Ashburnham House, Little Dean's Yard, Westminster, built by him, has been much altered, but there are remains of his work in the interior. There are probably a few others, but a good deal has been attributed to him on insufficient grounds.

Wren's Principal Works.

Sir Christopher Wren's first work of any importance was the Sheldonian Theatre, Oxford, designed by him in 1664—a building which still admirably answers the purpose for which it was constructed. At this time Wren was busied with various designs for altering Old St. Paul's, which had survived in a very ruinous condition the ill-treatment of the sixteenth century and of the Commonwealth. The Great Fire in 1666 put an end to all attempts to repair and alter it and made a new building necessary. I am not intending to dilate upon the existing cathedral, which you all know so well and in which there is so much to admire, but I should like to call your attention to a design which is even more distinctly Wren's than the existing cathedral. I refer to his first and favourite design, for which an elaborate and large scale model was prepared. This model still remains, though, unhappily, it suffered from neglect during many years, and I am glad to be able to inform you that it is undergoing restoration, though progress is necessarily slow. It is, however, in quite a sufficient state of preservation to enable Sir Christopher Wren's merit to be fully appreciated. We have here by Mr. Goodchild's kindness, two splendid drawings

presenting the interior of the cathedral as it would have been Wren had been allowed to execute this design. I do not say that it competes on equal terms externally with the existing structure, especially when we consider the height of the surrounding buildings, which gives the value of greater loftiness to the adopted design. But when we consider the two interiors, the balance altogether preponderates in preference of Wren's favourite design. As for certain defects in it, which Fergusson in his "History of Modern Architecture" discusses, we must remember that Wren had not, in the case of this design, as he had in the adopted one, thirty years of study and improvement to give to it as the work proceeded; but this marvellous production was the outcome of necessarily a very rapid incubation.

The late Rev. J. L. Petit, the exhibition of whose splendid water-colour drawings at the Institute some of us may remember, in discussing Saint-Front, Périgueux, and what has been said still might be derived from it, observes that Wren—who, though he may not have known Saint-Front, must have known Mark's, Venice, from which Saint-Front was derived—had conceived a design" (namely, this his favourite model) on similar principles, which, had it been carried out, would have given his cathedral the noblest interior in the world." I commend the whole passage and indeed the whole book to our study.

It is evident that Sir Christopher Wren's designs embodied the result of much study and many approximating revisions in preliminary sketches, carrying out in this the precept of Horace, "Sæpe stylum veritas," which may be familiarly translated, "Use your indiarubber freely;" and when the final result was attained I believe we shall always find that he considered rhythmical proportions as essential to completeness in architectural design as they are to poetry. I find the same thing in the two buildings of Sir Christopher's I have chiefly studied, namely, St. Paul's Cathedral and St. Stephen's, Walbrook, and I have no doubt it obtains also in his lovely creations Bow Steeple, St. Vedast, St. Martin's, Ludgate, and others of his works, which possess admirable qualities of elegance combined with simplicity.

Wren's Pupils and Followers.

The most conspicuous of Wren's followers were his pupil and assistant, Nicholas Hawksmoor and Vanbrugh and Gibbs, whom may be added, as an associate, Dean Aldrich, who built the church of All Saints, Oxford, and the Peckwater Court Church, in a style much in harmony with that of his friend, Sir Christopher Wren. The three first-named have left stately monuments. To mention only one work of each: Hawksmoor has given us, in his church of St. George, Bloomsbury, a monument worthy of the classical feeling he had imbibed from his master; James Gibbs, in his church of St. Mary-le-Strand, a work of great elegance, which I select from among his other buildings for the purpose of recording the attitude due to our late President for the zeal and pains he displayed in its restoration a few years ago, when its demolition as threatened by the utilitarians of the day; and Vanbrugh Castle Howard, a noble pile more pure than Blenheim. Vanbrugh, however, failed to impart, as Wren did, sufficient elegance to his powerful masses.

The above-named architects represent in date the middle of the seventeenth and the dawn of the eighteenth century, and they are the authors of standard works with which it is hard for the modern-schools to compete. The middle and end of the eighteenth century witnessed performances many of which are not wanting in dignity, but they offer a less uphill match for our own time. We must of course accept a common ground for comparison, for Gothic architecture was almost unknown in the eighteenth century, though an exception to this statement might be made in the case of the architect Essex. Limiting the inquiry, therefore, to the revived classical styles, the names of Lord Burlington and his friend Kent, and Kent's pupils Inigo Jones and Vardi—the latter the builder of Spenser House in the Green Park—the younger Dance, Sir William Chambers and James Gandon, the architect of the Four Courts in Dublin, are distinguished as being the first to receive the architectural gold medal of the Royal Academy, stand out pre-eminently. There is a simplicity and fitness for its purpose about Dance's principal works, Newgate and St. Luke's Hospital, which are worthy of being carefully noted. Sir William Chambers's great work, Somerset House, notwithstanding many effective new buildings on the Embankment, maintains its pre-eminence, and the Strand front and entrance may still be said to "hold the record" of similar combinations.

A little later in the century lived Wood, the architect of the new, whose palatial building of Prior Park is one of the ornaments of the eighteenth century; also James Wyatt, a man of versatile genius, and Robert Adam have left works of merit. At the turn of the century came Sir John Soane, whose most remarkable design, the Bank of England, has the merit of being thoroughly characteristic of the purpose of the building, flowing in this the spirit of his master, the younger Dance.

The British Architects of this Century.

When we come down to more recent times, by which I mean the first quarter of the present century, I find among the names of the architects some whom I myself remember when I settled in London as a pupil to Edward Blore in 1836. One of my first memories was the exhibition of the designs for the new Parliament Houses. They were exhibited in the rooms in Trafalgar Square, which had only lately been completed and had not yet been assigned to the Royal Academy, whose exhibition for that year was still held at Somerset House. Sir Charles Barry's design was approached by no rival. Some drawings were indeed sent in by Cockerell, but he had evidently not entered seriously into the struggle. Blore did not compete. So far as my judgment at that time can be trusted, the best of the unsuccessful designs was by Basevi. Besides the four just mentioned, the names I recall as the leading London architects were Samuel Angell, Tite, Hardwick, Sydney Smirke, Donaldson, Salvin; and, as a writer, Gwilt. For Sir John Soane, Sir Robert Smirke, Wilkins, Inwood and Decimus Burton, though living, belonged to an earlier decade; Thomas Henry Wyatt, Sir George Gilbert Scott and Sir James Pennethorne had scarcely at that time made their mark, and William Burn was just migrating to London from Scotland. I omit Augustus Welby Northmore Pugin, who, as far as the competition for the Parliament Houses was concerned, was, as it was already known, giving his assistance to Barry.

At the time to which I refer I consider that, with the exception of Pugin, Blore was the only architect who was quite at home in the detail of Gothic architecture. The full development of the revival had not come in, and it was the "day of small things;" but whilst we may reasonably complain of a want of massiveness for the most part in his works, there is a sense of elegance about his buildings which raises them above the level of the majority of the contemporary works of the Gothic revival. There are not many of his buildings in London. The exterior of the church of St. Thomas Charterhouse, in Goswell Road, may be cited as a good specimen, allowance being made for the decay of the Bath stone used in the decorative parts, the inability of which material to resist the London atmosphere was not so fully recognised then as it has been since.

Among the best buildings of the same period are two works by Shaw—the hall of Christ's Hospital and the tower of St. Dunstan's-in-the-West; fortunately a better stone was used in their construction.

The first place in the period which I am considering—for I purposely do not refer to the names of men who, like William Burges and George Edmund Street, attained such distinction during the second half of this century—must be assigned to Sir Charles Barry, not only on account of his great work, the Parliament Houses, in which, whatever amount of freedom in detail he may have allowed to his coadjutor Pugin, his great power of dealing with the masses was conspicuously his own. But independently of this, the Reform and Travellers' Clubs and Bridgewater House, to mention no other of his works, suffice to secure him this position. Barry was a man of extraordinary energy, of unwearied industry and of a powerful presence, qualities of the utmost importance to anyone engaged in works of such a scale as those which were entrusted to him, especially when combined with a courteous manner, of which I personally had the highest appreciation when he was on the committee assisting Dean Milman in the works intended for the completion of St. Paul's Cathedral.

The man of greatest distinction after Sir Charles Barry was unquestionably Professor Cockerell, a name deservedly revered and honoured, whose buildings include some of very great merit. Cockerell laid the foundation of the classical expression found in his works by an exhaustive study of Greek remains, of which he was an eminent and ardent explorer in days when such investigations were rare, and attended often with "perils from waters and with perils from robbers," in days when communications were very difficult. His fame would be considerable if it rested only on his published works. When he returned to England he entered heartily into the then fashionable Greek revival, and so far as it was possible to adapt the limited range not of its teaching, but of its available precedents, to modern practice, he succeeded—a claim which can be made for no other architect of our time but one, Schinkel, of Berlin.

Cockerell excelled as a draughtsman and was no mean sculptor. He himself modelled much of the ornament which he introduced into his works, and his mouldings are always examples of appropriate profile. These details and the propriety of their subordination to the whole, in addition to the sense of harmony and proportion which prevails throughout, are objects particularly worthy of study in his works. In London the Sun Fire Office near the Bank of England, and at Oxford the Taylor Museum, are buildings which will preserve his reputation as an architect. His lovable nature—

Not being less but more than all

The gentleness he seemed to be—

is still dominant in the remembrance of those who had the privilege to know him, but their number is now greatly reduced. There are, however, not wanting here those who can remember his son, which will help them in imagining what the father must have been. His admirable lectures delivered at the Royal Academy cannot but have produced good results on those who heard them. Both in Cockerell's works and in those of Barry will be found the same qualities of proportion and subordination of ornament which are conspicuous in the works of Sir Christopher Wren and architects of his school.

Nearly contemporary with Cockerell as a Greek explorer was Donaldson, the chief pillar of the Institute at its commencement. There is not much of executed building by him to which I need draw your attention, but he was an admirable instructor, and many of our present members owe much to him from his lectures at University College. He, too, has left a long-enduring memory of a kind and sympathising nature, and while mentioning Donaldson I cannot but refer to the three Papworths, father and sons, the last of whom has been borne to his grave since we last met in this room. The names of John and Wyatt Papworth, devoted supporters and benefactors of the Institute, must always be associated with its library, and that of the younger of the two with "The Dictionary of Architecture," for which he was a laborious worker, and the completion of which he, as its editor, happily lived to witness. I shall ask you presently, colleagues and gentlemen, to cause to be recorded upon the minutes of this meeting our sense of the loss sustained by the death of Wyatt Papworth.

To continue. Gandy Deering, himself a Greek explorer, having been engaged in that service by the Society of Dilettanti, exhibited much skill in his use of Greek elements, but for the most part the Greek revival did not and could not succeed, and it helped to bring on the Gothic revival, which apparently is also losing its vitality. Some good works, in which Greek detail is not so evident, were, however, produced about the same time, such as Arthur's Club-house and Basevi's Fitzwilliam Museum at Cambridge, the latter being left unfinished when Basevi met his death by a sad accident in Ely Cathedral, the building being completed by Cockerell, but the interior has been much altered since those days.

The most remarkable building of this period (if we exclude the Houses of Parliament, the style of which does not lend itself to the comparison) is St. George's Hall, Liverpool. The younger Elmes, who was the architect, did not live to finish the building, and after some delay Cockerell was appointed to complete the work. It appears that Elmes had left full instructions for its completion, but these documents had been lost or mislaid, so that when Cockerell came upon the work he had nothing to guide him but the shell of the building. The entire finishings as executed are by Cockerell's hand, but there can be no doubt that in every respect he loyally carried out Elmes's intentions so far as they could be gathered, and the harmonious result shows that he must have succeeded in practically doing so. The external approaches to the hall were worked out and finished with great care by Cockerell; these, however, have been since subjected to considerable alteration by others.

Proportion in Preference to Picturesqueness.

I have now carried the summary far enough, and shall not particularise any very recent buildings; and for the purpose in view, that is, the comparison of what was done in the seventeenth and eighteenth centuries with the works of the present time, there is no necessity for my doing so. Carried down to the extent it has been, we have found in Sir Charles Barry's and Professor Cockerell's works the same loyalty to the principles of subordination and proportion that prevailed in the days of Inigo Jones and Wren. But latterly they seem to have been too much lost sight of. Both the Greek and Gothic revivals have had the effect of bringing into contempt the precedents of Palladio and the great Italian authorities, and misinterpreted as the spirit of their rules often was, there was some reason in this reaction, for as far as such rules were supposed to supply the place of genius and thought, they were indeed fetters instead of helpers. That genius and thought could be replaced by rules of any kind was certainly a mistaken view. Followed as Palladian precedents and principles were by men like Inigo Jones, Wren and Chambers, as the language with which their thoughts were to be clothed, they had the same value in architecture that metre has in poetry. The license which is now too frequently taken with forms and features long recognised as essential, in favour of a treatment of which the final aim is picturesqueness, can hardly ever produce a satisfactory effect from all points of view. I do not hesitate, however, to allow that pleasing effects do, as it were, accidentally occur; and that we do not, in streets where architects have scope allowed them, see monotonous frontages of the class of Gower Street and Wimpole Street—such as were general at the beginning of the century, though even to them some excuse must be granted. Those were hard times when the country was struggling in a great war for very life, and severe economy in building was then much more insisted upon than it has been of late; and had that restriction not happily

been relieved, there could not have been employment for more than about one-tenth of the number who are at present enrolled in the profession. The relaxation of architectural discipline, however, was not a necessary element in the result referred to, for quite sufficient variety and of a better quality can be obtained by proper study without ignoring accepted precedents or neglecting principles of still greater value namely, proportional relations of contiguous parts and subordination of details to the purposes for which they serve and to the general effect. My predecessor in this chair insisted so well and so emphatically on the evil of redundant ornamentation that I should only weaken what he so well urged were I to say more than that I heartily agree with every word he uttered or the subject in his last annual address to the Institute.

Dean GREGORY (Dean of St. Paul's) said he rose with great pleasure to propose a hearty vote of thanks to the President for his address. All, whether students of architecture or—as he described himself—one ignorant of architecture, must have felt indebted to the President for his address. If he were a professional architect he might essay criticism if there were an opening for it, but he was not going to attempt any criticism. He congratulated the Institute on the rapid and large increase in membership. They as architects were very prosperous, unless the general body of them had only a limited practice. A vast amount of buildings were being erected, but there was too often little beauty about them. The public would not spend more money than they could help on buildings, and further they were often handicapped by the cost of land. In his own profession here was employment for many, but remuneration was very limited. There was a hidden work—one that did not show—one that had caused him trouble—drains. Architects did not look after them till they were all finished. The revision of drains cost the unfortunate owners or occupiers an immense sum to have them reconstructed. With regard to St. Paul's they had been told they should wash the exterior thoroughly. Of all the silly suggestions he had heard for a long time, that was the silliest. The letters in the papers, he had thought, had not required answering. He and his predecessor, the late Dean Church, had carefully inspected the treatment of other buildings by washing, and it struck him that they looked like streaky bacon. All acquainted with ancient buildings, and aware of how they should look, would condemn any such treatment. Twenty-six years ago he was appointed to the canonry of St. Paul's. He went to Italy to visit the churches and learn, if possible, what should be done with the interior. The Dean then referred with praise to Mr. W. B. Richmond's work, but added that it could not properly be judged of until the scaffolding was removed from the chancel, which would not take place for two years. He thought it a scandal that a building so purposely constructed for decoration as St. Paul's Cathedral had been, was left for 200 years undecorated, though possibly that was an advantage, as there were better artists now.

Mr. ALMA-TADEMA said he was very proud to be called on to second the vote of thanks to the President, who was the great Athenian scholar. On questions of art he expressed his opinion that in Universities and in the very best of schools, even of the highest class, art education did not receive the amount of attention that the subject required.

The PRESIDENT returned thanks, and a vote of condolence having been passed to the widow and family of the late Wyatt Papworth, the proceedings terminated.

EXCAVATIONS IN CYPRUS.

THE following interesting account of recent discoveries made by Dr. Max Ohnefalsch-Richter in Cyprus, under a commission from the German Emperor, has been contributed by him to the *Times* :—

It was Sir Henry Bulwer, former High Commissioner, who gave the impulse to the German explorations in Cyprus. True to the traditions of his family, he has always taken a very deep interest in scientific investigations. When he heard, for reasons which I cannot state here, I had been shut out from the more extensive excavations in Cyprus, begun by the British in 1888, he advised me to try Berlin. He saw how rich Cyprus was in antiquities and that there was plenty of room for more workers. It was his principle to encourage all systematically-conducted excavations under the authority of learned bodies, museums or Ministries of Instruction (to what ever country they belonged), and to forbid all private excavations undertaken with a view to individual gains. If the British alone were allowed to excavate, the number of genuine workers would not be great enough to check underhand lawless plunder, and to keep up a large police force would be too costly. Besides, an extension of the permission to excavate would, without extra outlay, bring to the Government of Cyprus and to the flourishing Cyprus Museum in Nicosia rich acquisitions. For by the law as it at present stands one-third of the finds on private land and two-thirds on State land fall to the Cyprus Government, and these shares must be brought to Nicosia and delivered up.

The researches in the kingdom of Tamassos were undertaken by the General Administration of the Royal Berlin Museums, and I was responsible to the General Director Geheimath Schöne. The researches in the kingdom of Idalion were directly commissioned by His Majesty the Emperor, and my immediate superior is his Excellency Dr. Bosse, Secretary of State for Public Instruction. I have always enjoyed special encouragement from Dr. A. Furtwaengler, of the Berlin University and Berlin Museum, now called to the Munich University and Munich Museum as successor to the famous Professor H. Brunn. Dr. Furtwaengler was sent to Cyprus in 1889 and 1894 on behalf of the Prussian Government to superintend my work and arrange for the partition of the antiquities.

The collected results of investigations in Tamassos and Idalion (with some additions from other parts of the island) are to be published in 1895 by Giesecke and Devrient, in a richly illustrated work entitled "Tamassos und Idalion." For this work His Majesty the German Emperor has allowed a considerable sum of money. I shall publish the work in collaboration with Professor Furtwaengler. Other contributors to the work are Professor R. Virchow (Berlin), H. Weeren (Berlin-Charlottenburg), W. Deecke (Buchweiler), J. Euting (Strasbourg), R. Meister (Leipzig), Dr. W. von Landau (Berlin), and possibly also Dr. Dörpfeld (Athens).

The most interesting fact connected with the two kingdoms of Tamassos and Idalion is that within their compass are found remains of so many different periods of civilisation, from the earliest to the late Roman or Byzantine times. Therefore a work treating of these two sites amounts to an essay on Cyprian civilisation and art. Assuming this to be so, the different periods will be much better understood by reference to the plates showing form in pottery, which reproduce the most characteristic and least fragile of the terra-cotta vessels.

In Tamassos the excavations began in the Necropoleis. The oldest field of graves runs right up to the southern edge of the tower of Tamassos, and is situated on the slope of a hill named Lamberti. The remains in it belong to the bronze, but not to the copper period. The oldest strata of all, which appear in their full purity near Idalion at Alambra Mavragi, are here absent. At the period to which the oldest graves of Tamassos belong, as in Hissarlik, pottery is still unpainted, and this is one of the most striking features of resemblance between Cyprus pottery of this kind and that found in the lowest strata of Troy-Hissarlik. In the tombs of Lamberti vessels are painted and made by hand, not on the potter's wheel. The earliest wheel-turned vessels which appear in the Cyprian bronze period are the so-called Mycenæ vases, probably originally imported and then imitated on the island. The potter's wheel first appears in the period of transition between iron and bronze, when Greeks and Phœnicians are known to have been settled on the island. The finds at Tamassos belonging to this stratum consist of clay vessels, stone utensils, bronze and copper objects and glazed beads were very numerous. Silver was rare, gold still rarer. Only two gold bracelets were found, and they were exactly like Trojan gold bracelets. In general the evidence of the remains goes to prove that the oldest Cyprian population was settled in the north and west, not in the south-east. The earliest immigrants to Cyprus had nothing to do with Egypt, Syria, Mesopotamia or the Semites. They belonged to the same group of races as the original inhabitants of Southern, Central and perhaps Northern Europe, and if we name them at all we must call them Indo-Europeans. The English scholar, J. L. Myers, has recently given valuable testimony in favour of this view. They were an agricultural race, who, as discoveries show, lived only in the fruitful and well-watered plains. In almost every tomb are found the customary milk-pans and milking-vessels, and each of the early settlements is marked by a heap of grindstones for corn.

At Tamassos I found some of these stones with the corpses in the graves. About the middle of the second century B.C., or perhaps earlier, the trade with Egypt began. After this green-glazed clay amulets, Egyptian scarabs and ivory occur.

The most unique example of pottery of this period is an amphora-shaped vase, burnt and painted, found at Tamassos, the two handles of which are formed by two dogs springing up among the vases represented in the wall-painting on the tomb of Rokhmara, king of Egypt, as being presented by the Kefa Thothmes III., is one so very similar to this that there can be no question of chance. We must conclude that there was free communication between Cyprus and Egypt. Probably the Kefa brought vases like this, made in Cyprus, as a tribute to the Egyptian kings. In the same tombs I found a multitude of peculiar bronze pins with mushroom-shaped heads and a rectangular slit in the upper part. Flinders Petrie found many of this kind in Egypt, and has already referred to the Cyprus finds (although without accurate reports as a basis), and proposed to use them as evidence of date. These pins belong to the same period in both places.

In this campaign I found no early Babylonian or Assyrian objects in Idalion or Tamassos. But in the necropolis at Ayia Triakhevi, excavated by Mr. J. L. Myers, I found in December

1884, for the Cyprus Museum, a real Babylonio-Assyrian cylinder mounted in gold and inscribed in cuneiform character. The late Assyriologist, S. Birch, dated the cylinder before 1500 B.C., A. H. Sayce before 2000 B.C. Whether, as some have supposed probable, Argon I. undertook a campaign against Cyprus, and whether Sargon I. must really be dated about 3800 B.C., can only be decided by more evidence from cuneiform inscriptions. The cylinder of Sargon I. and his son Naram-Sin was found in Cyprus; but, unfortunately, no trustworthy archaeologist was present at the excavation.

Another important epoch, remains of which I have identified at Tamassos and Idalion, is the great Mycenæan period, when Peloponnesian Greeks first came as adventurers and mercenary soldiers to the further East and Egypt, to appear later as a successful, independent, warlike and conquering Power. Our work, "Tamassos und Idalion," will treat specially of this interesting page of Oriental history in which Cyprus is closely concerned.

The monuments of the Græco-Phœnician period at Tamassos and Idalion are of great interest. The theory so rife among older authors that the Phœnicians from the earliest times were masters of the sea must now be abandoned. It was only at the beginning of the second century B.C. that the Phœnicians extended their numerous factories and threads of connection over the whole of the then known world. This period falls into several divisions, but the Phœnician element never appears pure—always mingled with Greek influence. Valuable remains of it exist in Tamassos and Idalion. This is the period of Homer and his lays. The influence of Homeric customs lasts several centuries. When discoveries from Homeric times are not forthcoming, we must interpret Homer in the light of discoveries from the ages during which the influence of Homeric culture was still felt. This was the plan followed by Helbig in his "Das Homerische Epos," and I supplied him with a mass of material for his second edition.

From the discoveries made at Tamassos for the Royal Museums I select only one example for mention, viz. a mighty sword of iron now in Cambridge, England. When the finds were divided the sword fell to the share of his Beatitude the Archbishop Sophronios, and it was sold by him with other things to Sir Henry Bulwer, who presented it to the museum at Cambridge. I excavated the sword in one of the kings' graves near Tamassos. It certainly belongs to the sixth century B.C. It is the first known instance of a sword adorned with silver bosses such as Homer describes. In the massive handle, fitted with ivory scales, I found the bronze sword-nails with silver heads still in their places. In shape the sword was the same as the one excavated by Schliemann on the Acropolis of Mycenæ. In the same royal tomb I found, in addition to numerous other bronzes, a helmet with a ball-top and cheek pieces (now in Berlin), and a sword-nail with a gold head, probably belonging to a still finer gala sword, which must have been taken away in very early times. Homer says that Agamemnon's sword was studded with golden nails. My discoveries, now in Cambridge, including the sword and the sword-nail, are briefly described in the London *Academy*, but their meaning seems to have escaped the writer of the notice.

Side by side with the Homeric lays, the early national Epos of the Aryan Greeks towers its great Oriental Semitic counterpart, the Old Testament of the Hebrews.

It was no great wonder that in Cyprus, so early colonised by Greeks and Phœnicians, many discoveries were made which help to explain the Old Testament. In my recent work, "Kypros, the Bible and Homer" (published by Asher & Co., London, 1893), I treated the subject fully. I will here notice only one discovery made by me a few weeks ago on the Eastern Acropolis of Idalion. Among the female trinkets spoken of in the Old Testament the Nezem, or nose-ring, occurs very frequently. I have been so fortunate as to be able to identify in Cyprus this strange ornament hitherto unknown in Eastern archaeology. One of the heads of the clay figures which were set up in the enclosure for votive offerings belonging to the sanctuary of Aphrodite wears the nose-ring. This will be published in our forthcoming work. Among the Græco-Phœnician finds from the graves of Tamassos may be noted some fine engraved gems and glass pastes in silver and gold swivel rings, among the designs being a scene of war-chariots and the "exposition" of a corpse surrounded by genii; a silver kylix, with a beautifully-modelled relief in the centre representing a horse walking (Cyprus Museum); several pairs of large gold earrings with fine pendants shaped like berries and recalling Homer's "mulberry" earring; a cornelian carved in the form of a sparrow-hawk and heavily set in gold (also in Nicosia). Among the bronzes were some beautifully stylised pitchers, cups, candelabra, and more important still, fragments of bronze coats of mail with engraved designs, one of them representing a striding figure in Egyptian taste (Berlin). Among the objects made of iron there are, besides the swords already mentioned, a knife with an ivory handle and the representation of a dog in Assyrian taste, and a number of mighty javelins (wrongly

called prongs for roasting meat). Among the vases a conspicuous place is taken by a valuable imported black-figured Attic amphora, the work either of Amasis, the well-known Greek vase-painter, or of one of his most skilful pupils. A comparison with other vases known to be by Amasis will suffice to substantiate this conclusion. The vase is in the Cyprus Museum.

A very beautiful object was found in a stone chest walled in above the finest royal tomb (No. 5, Section IV.), and now in the Cyprus Museum. It is of late Hellenistic date and may serve to represent the more recent stratum. This is a gold chain of marvellously fine workmanship, made in a complicated knotted pattern and ending in two charming female heads. There can be no doubt about the date, although if we were to decide by workmanship alone, we should be tempted to place it earlier. The chain must have lain round the neck of the corpse, and at the side of the head, near the ears, lay ornaments in the shape of flying Erotes, an earring-motive which has long been known to belong to late Hellenistic times. Near the mouth lay two obols, one of them a bronze coin of an early Roman emperor, the other a coin of one of the later Ptolemies.

The most important German discovery in Tamassos consists of three royal tombs, two of them approached by steps, the third by a sloping road or dromos about 60 feet long. In making these graves the soil was first taken away till sufficient space was emptied, and then the masonry was built in. The inner coating of the tombs and the pointed roofs of all three are made of carefully-hewn blocks of stones. The blocks for the roofs are of colossal dimensions. The inner walls are all the visitor sees. They are made of uncemented blocks laid one on the other, and rivetted together inside by large leaden bolts. The space between the masonry and the soil is filled up with broken bits and rough stones fastened together with lime mortar. The same materials were placed over the roofs. The tomb without a stair is sunk deeper than the other two. It is also the largest and roomiest of the three, and has a roof like a church. The approach, of 60 feet in length, is simply dug in the earth, and leads slanting down to a large entrance-court paved with flagstones. All along each side the approach is lined with a massive wall.

In this "Dromos" grave the door is not ornamented, and is closed by a massive flagstone.

The graves with steps are much richer. The smaller one consists of a single chamber. The sarcophagus in which the prince was buried was placed at the inner end of the chamber. Here the entrance is ornamented with a toothed edge, and flanked by two pilasters, which rise directly from the stone floor, but end above in capitals with snail-shell volutes. In the third grave, which is architectonically the richest, and contains two chambers, there are similar capitals, with the snail-shell volutes growing out of a triangle.

The large stone tomb with the dromos had been plundered, probably only once, on account of the gold and silver objects and the engraved gems. The spoliation not being complete, we were able to bring away a number of ornaments, among them some gems, two of which were set in rings, one of gold, one a silver swivel ring. The grave with one chamber and flight of steps had been completely denuded of gold and silver, with the exception of the gold sword-nail already spoken of, and a silver kylix of half-spherical form; but almost all the bronze and iron objects had been left.

The grave with two chambers and a flight of steps must have been plundered several times, even as late as the period when bronze was so much in request. Nothing was left but common clay ware. The architecture is very interesting, for it directly imitates in stone the construction of wood, a procedure almost without parallel. We first enter a kind of porch formed of a flat roof of beams laid close together, supported by Ionicised capitals and pilasters. Passing through this we enter the tomb chambers, the first a large roomy ante-chamber, the second the funeral chamber properly so called, containing a mound on which the sarcophagus is placed. While the funeral chamber produces an effect of simple massive dignity, the porch is adorned with every kind of design. Over the entrance door and the door into the funeral chamber are blind windows with richly-carved and decorated sills in wood technique imitated in stone. Windows of corresponding shape and size can be bought to-day in the villages. I bought one with shutters in Lapithos. When the shutters are shut they look just like the antique imitations in the royal tomb. In our publication we give an illustration of the modern window. The ornaments which repeat themselves in the antique window-sills may be seen in the votive capitals and votive stelai on the Acropolis of Idalion. The design is formed of triangles, out of which grow above palmettes; below, snail-shells. A horizontal plaque finishes it off. In the triangles are sun and half-moon or a head of Hathor; in the space between the volutes of the palmettes is a bunch of lotus-buds and flowers, with or without smaller palmette blossoms. Besides the richly-ornamented windows over the real doors in our Tamassos tomb a massive blind door is constructed on each side of the rectangular

front porch, and is represented as if barred. The massive bolt drawn forward, just as it is in reality in a modern peasant's house and in the house where I live. My publication will contain representation of a modern peasant's bolt of this kind.

The roofing of the porch is very elaborate, and consists of rafters curiously knitted together with boards. A complicated wood construction is here imitated in stone. Lastly, on the entrance-door a wooden lock is imitated in stone. The same things occur in the smaller stone tomb. Wooden locks exact like the ancient ones are to be seen in numbers in the villages of the island. In modern peasant houses at Karpas I found surprising parallels to the pilasters and capitals with snail-shell volutes, which have their broad sides in one line of direction not with the façade, but with the door-jambs. These explain themselves from the roof construction as a whole.

I excavated two more sanctuaries in Tamassos, for the Royal Museums. The first, dedicated to the Mother of the God was a very primitive one within the town. Only small votive offerings were found here, statuettes of clay and stone, and one Greek dedicatory inscription applied to the edge of a vessel.

The other sanctuary lies outside the town, on the river Pidas (the Pedaïos of the ancients); between two villages, and was dedicated to Apollo. L. Ross mentions the site in the record of his travels, and I was fortunate enough to identify it. Some time before his arrival a life-size bronze statue had been found, hewn in pieces, and sold separately by weight as old bronze. On the same site I excavated two very peculiar archaic bronze statuettes. The larger, now in Berlin, is of good workmanship, and wears a helmet; the smaller, of rougher execution, with an Egyptian head-cloth, is in a private collection at Nicosia. The larger one recalls in position and attitude the so-called Apollo figures, such as those of Boeotia. I also found remains of life-size bronze statues, a headless stone colossal draped figure of Hellenistic period, and, finally, a stone four-horsed chariot from the period of Pheidias. This was much defaced by the river water.

I was obliged to give up my excavation in consequence of a sudden tempest of rain, which flooded and washed away what had already dug out of the bed of the river, thus annihilating the results of my labour.

In Idalion we first examined the field of tombs surrounding the town. Among the finds I am inclined to lay special stress on some archaic gold leaves belonging to breastplates and decorated with sunk impressions representing a corn divinity. The eyes are closed as in figures on Mycenaean gold ornaments. The god protrudes his tongue and wears a crown of corn ears and a long garment with a tasselled girdle. His arms are extended and so are the hands, which hold ears of corn. To judge by the clay vessels found in it the tomb is certainly older than 600 B.C. These golden breastplates were sent with the other contents of the tomb to Berlin.

The other grave (No. 26) fell to the share of the Cyprus Museum. Among the ornamental objects, I may mention a silver swivel ring with a scaraboid, on which a lyre is engraved set in gold.

In the same stratum of discovery in Idalion, Tamassos and other parts of Cyprus appear antique fibulae, mostly of bronze, more rarely of silver, more rarely still of gold. In a similar tomb at Idalion lay two small elongated fibulae of silver in shape and size like our modern safety-pins, and also a large bronze bow-shaped fibula.

Among the tomb discoveries was a small aryballos made of green-glazed clay, and interesting because of its rarity. It is in the form of a double head, one being male and bearded, the other female.

Among the clay vessels were again some imported from Athens—e.g. an aryballos in the form of a female head and a small pipkin with an ancient Greek inscription scratched on it. A Cyprian shell lamp bears a long-scratched inscription in the Cyprian syllabary character.

Among indigenous vases I was struck by a kylix with a metope-like painting on the shoulder in a design of rosettes and birds. This seems to be an attempt to imitate a Dipylos type.

The underground royal graves at Tamassos, with all their splendour of architecture, bronzes, weapons and ornaments, find a brilliant counterpart in the principal sanctuary of the Idalion Aphrodite on its proud mountain height. The present writer was the discoverer of this sanctuary. The site of the ancient town of Idalion had been ascertained by L. Ross with approximate correctness. Its natural situation on two hills was the occasion of the existence of two acropoleis, an eastern and a western. While I was able to identify a sanctuary of the Idalion Athene on the western acropolis, I succeeded in discovering and partly excavating the sanctuary of Aphrodite on the eastern acropolis. This adjoined the sacred mountain grove in which, according to the legend, Aphrodite met her lover Adonis. The whole sacred wood originally lay outside the town, stretching far along the chain of hills which begins with the hill of the eastern acropolis. It was only in later times, although certainly not later than the fourth century, that the

high altar and part of the mountain wood containing a space for votive gifts were enclosed, thus forming a smaller precinct entirely within the surrounding city wall, perhaps about 125 m. long and 85 m. broad. This newly-formed Aphrodite precinct was guarded by a formidable rampart of masonry and earth, in itself sufficient evidence for the high estimation in which the Aphrodite shrine was still held. It is true that not much respect was paid to the older gifts of piety. The larger stone votive offerings of former centuries were simply cleared away and built into the fortifications. Consequently, when we began to excavate we were obliged not only to dig out the sanctuary within the rampart, but to pull down and examine the fortification itself. The most valuable discoveries were made during this process. The rampart consisted of a core of strong masonry, faced with smaller stones and covered with a mound of earth. Among the remains built into this structure I must speak first of some capitals of a peculiar kind. Thirteen of these are in fairly good preservation, and there are smaller fragments of as many more. Although all these capitals are worked in the same style, they differ in size, excellence of technique and detail of ornament. They are all tall, wide and thin, and only worked on one side. The height varies from 70 cm. to a metre, while the thickness fluctuates between 10 and 15 cm. Some few fragments are as thick as 35 cm., and seem to belong to capitals about 2 metres in height. On the upper and broader side are no traces of any kind which would lead us to suppose that the capitals had been used as structural supports or bases of statues. On the narrower, lower side of each appears a rivet hole. These holes differ in size and depth.

All doubts as to the purpose of these highly-ornamented capitals are set at rest by the discovery of a stele of elongated tabular form 1.47 m. high, which resembles the capitals (a stele of this kind is now in Berlin). Out of a triangle, which is filled in, now with sun and half-moon, and again with a Hathor head, grow downwards and outwards curly snail-shaped volutes, upwards and inwards a rich palmette ornament. Up above the triangle the centre within the palmette is filled with various decorative designs—lotus buds and flowers and palmette blossoms.

One of the less important finds in the stratum of ashes on a primitive altar site within the fortification was a small flat four-cornered, board-like votive pillar of clay, only 11.7 mm high. It ends at the top in snail volutes, and has holes by which it was hung up in the sacred place. As in the large capitals, the upper, narrow side is plain, while in the lower a rivet hole is indicated. This must be a reduced copy of a votive pillar complete in itself. All these objects, the capitals, pillars and tablets—the larger of stone, the smaller of clay—are merely different forms of votive stelai, which, like statues and statuettes of gods, men and beasts, were set up in the sanctuary. Dr. W. Dörpfeld drew my attention to the votive capitals for the support of statues found on the Acropolis of Athens. In this case the statues are missing, and the capitals themselves serve as votive gifts. Some interesting sculptures were found in the fortifications. Among them is a goddess enthroned, almost life-size, a Sphinx seated on her throne. The style is archaic, but evidently under Greek influence. This splendid piece of sculpture is now in the Berlin Museum. A torso of a woman in the well-known "Spes" motive is purely Greek archaic. The workmanship is very exact and recalls the replicas found on the Acropolis of Athens. At the partition the torso fell to the share of the Prussian Government, as did also an almost life-size crowned female head in Greek archaic style, while another head of similar style but wearing a high coil fell to the owner of the soil. Within the fortifications we struck, as it seems, three kinds of masonry. The lowest layer of wall is of a very primitive kind, consisting of large air-dried bricks, first recognised as such by the penetrating eye of Professor A. Furtwängler. Close to this layer of bricks above and below were two layers which contained sculptures. The stratum of discovery under the air-dried bricks was small in extent and noticeable for a great quantity of charcoal and ashes from burnt sacrifices. In this layer of burnt remains, as in the altis of Olympia, there were found many small terra-cottas either rudely worked in the "Snowman" technique or better executed, but still very archaic in style. The standing figures were male and female; one was suckling a child, another played the double flute. There were besides a fragment of a figure seated on a throne, remains of war and processional chariots, horses, horsemen, an ox, a lion and a goat. A great number of birds were found, some of them richly painted and better modelled. Strangely enough there was no representation of the dove, the bird of Aphrodite, but we can clearly identify hens, ducks and geese, and an eagle is distinctly characterised. Among the better executed terra-cottas of antiquated style in this stratum of discovery, the figure of a snake charmer is conspicuous. It is 0.147 m. high. A man in a high cap with the upper lip shaven, but wearing a long rounded beard, stands in a stiff attitude holding two large snakes with both hands against his breast. Eyes, hair, beard

and snakes are painted black, the rest of the figure dark red. Beside the antiquated terra-cottas lay a large mass of small vessels, especially pitchers.

As I describe these votive offerings fully in my coming work I need not enlarge on them here. I may only say that the finds form an essential continuation of those which I discovered in 1885 in the Aphrodite sanctuary north of Idalion, and published in the numerous illustrations of "Kypros, the Bible and Homer." The chief new acquisitions are the remarkable votive pillars and the enthroned goddess with the Sphinx. This sanctuary certainly contains older and more important votive gifts than those found in the temple at Old-Paphos. Professor A. Furtwängler, one of the excavators of Olympia and one of the first archaeologists of the day, who is my collaborateur in the forthcoming work, came to Cyprus just in time to assist at the excavation of the hill, and in fact to direct it. I owe special gratitude to him for the information given on the spot and for many of the most valuable observations.

Unfortunately but a small part of this very promising site could be excavated. We shall not be able to make many definite statements about the ground plan of the buildings until the whole, or at least most, of the hill has been laid bare. To do this about 12,500 metres of soil must be removed. But this much is sure. I have discovered the famous sanctuary of Idalian Aphrodite so much sung by the poets, and the antiquities which it contains are centuries older than the antiquities of Old Paphos. I cannot be grateful enough to his Majesty the German Emperor for the generosity with which he has placed German funds at my disposal for the continuance of research in Cyprus. I desire also most sincerely to thank the British Government and its representatives in England and in Cyprus, especially the High Commissioner, Sir W. J. Sendall, the Chief Secretary, H. Thompson, and the commissioners, M. King and C. D. Cobham, for their liberal aid.

Lastly, I have to thank my wife, who was appointed as my official assistant by the Prussian Minister of Instruction, and to whose skill and energy it is due that my work proceeds with a rapidity and efficiency hitherto unattained.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

AN address was delivered by the President of the Birmingham Architectural Association (Mr. William Henman) on the 2nd inst. relating to the programme for the coming session. In the course of his remarks he referred to the education of the public taste in the matter of architecture. He said that some advance in this direction had during the last few years been undoubtedly made, but that "love of money, which is the root of all evil," and the bane of good architecture not only stifled the art, but disfigured every building with hideous signs and letterings. The time had come when the public should protest against the display of this vulgarity, and local authorities should obtain powers to suppress it, as in old times Acts of Parliament were passed to curb the excessive display of signboards which, compared with modern advertising methods, were greatly to be preferred for their generally artistic treatment and effect. If, instead of detaining students for hours together in overheated and badly-ventilated class-rooms of our schools of art, daubing paints and laboriously stippling, they were frequently conducted through the streets of our cities and towns under the guidance of men of taste, and taught to appreciate the good in architecture, to despise what is base and degrading thereto, to observe the inartistic design of our lamp-posts, street-name plates and other efforts of officialdom, we might hope that the next generation would not be oppressed by so many impetuous painters of mediocrity, or the exhibitions flooded with their puerile productions; but in their place would grow up a healthy majority of men and women, capable of appreciating that which is artistic, who would, at least, insist that our streets should not be made hideous as they are to-day; together with a minority of trained artists who would give suitable expression to the desire for beauty to reign in public places as well as in private houses. Such a revolution in popular artistic perception and work could only be brought about in the course of time. It must necessarily be of slow growth, but if never a voice be raised against the present deplorable state of things it would go from bad to worse. In this age of hurry it was well that some things moved slowly, in the hope that when times were ripe and ideas matured men might rise endowed with power worthily to carry out desired objects. Might this be the case with regard to our much-talked-of Birmingham cathedral, so that when, some years hence, it is proposed to raise a memorial to a good and worthy bishop or honourable and honoured citizen, and it is decided a cathedral shall be built, public appreciation of architecture may be so far advanced that the question will never be raised, as it had been during the last few days, whether it would be practical to "convert a Grecian church into a Gothic cathedral." If the taste and

demands of that day determined that the site of St. Philip's Church should be that of Birmingham's cathedral, then although he gave place to none in reasonable reverence for work of the past, and much admired the tower of that church, he sincerely hoped it would not be allowed to influence the style of a building which must necessarily be of greater importance, nor that it would simply make way for a "Gothic cathedral." He would rather that the inhabitants of the city and neighbourhood would with one voice and open purse demand that the building should be worthy its position, designed by able hands in the best style of the period, whatever that may be, so long as it was neither a mere archaeological compilation of dead bones nor an eccentric novelty devoid of all traditions of architectural propriety.

Glasgow Institute of Architects.

SIR,—In your impression of the 26th ult. a report of a meeting of the Glasgow Institute of Architects appeared, in which it was stated that "there was an opinion abroad that the very large expenditure of money on public buildings was not done in the most judicious way," that the architect had his reputation to sustain, and if employed in public buildings would not be slow to let what light was in him shine forth, and that "surely it would be for the public advantage that architects of the greatest experience should be employed to design and superintend their buildings."

As in this report reference is made to the Lord Provost and the Police Commissioners, it is obvious that the "public buildings" alluded to are those that are designed in the Office of Public Works.

Now of such buildings as are generally designed there there can be no "architects of greater experience" than those who, for half a century, have been specially employed upon them—public buildings principally in connection with the Police Department of the city. The Office of Public Works, created by Mr. Carrick nearly fifty years ago, has a "reputation to sustain," the reputation formed by its great chief, who was an architect that perhaps more than most knew not only how best to plan "public buildings," sufficient for police, but how most economically to expend on those buildings the money of the ratepayers.

The report says that it would be for the public advantage not only that architects of the greatest experience should be employed, but that the architect, having his reputation to sustain, would not be slow to let what light was in him shine forth. To illustrate this, let us look at a public building recently completed by the President of the Institute, and who, when the report was submitted, occupied the chair. On the street level are stunted columns, with an entablature *minus* both architrave and frieze, but with a cornice that, like Cleopatra's person, "beggars all description," while above are Corinthian columns of about a dozen and a half diameters engaged to the wall, and having the entablature broken over each. The grouping of the windows is in twos, a composition than which scarcely any can be worse, if indeed it be composition at all, and, as Burns says, "of whatna date or whatna style" is the termination of the gable it surpasses the wit of man to know or understand. This "pipe-staple" Corinthian column is in even this age of "progress" scarcely an improvement upon the old-fashioned manner of the Lanthorn of Demosthenes or the Temple of Jupiter Stator. The President of the Institute may have a reputation to sustain, and "the light that is in him" may be one that hitherto has not shone upon either sea or shore; it is not, however, a meteoric flash that we would like to see thrown upon even a Glasgow police-office.

Those who live in glass houses ought not themselves to throw stones, and the mouthpiece of the Institute indicates by the building to which I have referred that he is not the critic to speak of "work not done in the most judicious way"—unless, perhaps, that which is done by himself.

Barry in London, in the Reform Club-house, and Thomson in Glasgow, in Great Western Terrace, taught what "architecture" is; but learning doesn't always follow teaching.—I am, sir, your obedient servant,

ÆDILE.

The Building Trade Dispute.

SIR,—I shall be obliged if you will be good enough to insert the following account of this so-called strike in your valuable paper, as it is desirable that the public should be correctly informed of the facts of the case.

Messrs. Trollope had a call from a Mr. Verdon, the secretary of the London Building Trades Federation, one day last week, who complained that at two of their jobs the foremen

had, by declining to employ any but non-Union bricklayers, broken the honourable understanding arrived at between the employers and employed at the time of the settlement of the last strike in the building trade, to the effect that no distinction should be made between Union and non-Union workmen.

Mr. Verdon was informed that he was mistaken as to his facts, but further inquiry would be made. He then demanded that the foreman and certain men who he stated had come from another job and had been mixed up in some dispute—of which Messrs. Trollope then heard for the first time—between another builder and the Trades Unions, should be at once discharged and society men only employed in their place, threatening, if they did not comply, a strike would take place. It was pointed out that, after complaining of an alleged breach of agreement on Messrs. Trollope's part (which, it was subsequently found, had not taken place and Mr. Verdon was so informed), it was hardly reasonable to ask Messrs. Trollope to really commit a breach of faith by acting in the manner he desired and Messrs. Trollope certainly did not intend to do so.

A number of men have rather hastily left Messrs. Trollope's employment, presumably in execution of the threat held out by Mr. Verdon and in support of a course of action on the part of the Trade Societies which causes the outlook to be a very serious one.—I am, Sir, your obedient servant,

R. S. HENSHAW, Secretary.

The Central Association of Master Builders of London,
31 and 32 Bedford Street, Strand, W.C.: November 2.

GENERAL.

Sir John Gilbert, R.A., has intimated to the arts committee of the Blackburn Corporation his intention to present to the borough his painting, *The Baggage Waggon*, and a landscape entitled *Keston Common, Kent*.

Mr. F. H. Rathbone will read a paper at the Liverpool Artists' Club on "The Necessity of Art for the Future Prosperity of Liverpool."

Major Davis, F.S.A., who has been conducting further excavations at Bath, has reported that he had unearthed undoubted proof that the Romans drank as well as bathed in the mineral waters. Old drinking-vessels had been discovered, together with numerous Roman ornaments and coins, alleged to be of the period of Nero. A very remarkable Roman drain, formed of oak and stone, formerly covered in lead, is also among the discoveries.

Dr. W. E. Sumpter, of the Battersea Polytechnic School, London, has been selected by the technical school committee of the Birmingham Corporation from among seventy-five candidates as principal of the new local technical school. The salary is 500*l.* per annum. Dr. Sumpter is a Fellow of the University College, London, and of the City and Guilds of London Institute, a member of the Council of the Physical Society of London, and of the Institute of Electrical Engineers.

Bronze Gates, designed by Mr. B. Champneys, have just been erected, at a cost of over 700*l.*, at what is now the main entrance of Newnham College, Cambridge, under the archway of Pfeiffer Buildings, and on Saturday were formally presented to the Council on behalf of the students of the college, by whom they were given as a memorial of Miss Clough.

The Sedgwick Memorial Museum Syndicate have reported that the cost of the building proposed to be erected in Cambridge exceeds the architect's calculations by the sum of 4,500*l.* They therefore recommend that they be empowered to reconsider the plan approved by the Senate, and, if necessary, to substitute a new one for it, and that they report to the Senate before the end of the ensuing Lent term.

The Artists' Guild on Monday opened their sixth annual show of amateur decorative work at the Royal Albert Hall.

The Duke of Westminster has given the site, and is building at his own expense, at a cost of about 3,000*l.*, a working men's club and institute for Handbridge, a suburb of Chester.

Lord Derby has given to the borough of Bury a plot of land, about 2½ acres in extent, adjoining the Duke of Clarence Recreation Ground, Walmersley Road, Bury, for the purpose of the grounds being enlarged.

Sir D. A. Lange, C.E., died suddenly in London on Friday. He was appointed in 1858 by Said Pasha, Viceroy of Egypt, constructor of the Suez Canal, and was for some years director in England of that work, on the completion of which he received the honour of knighthood from the Queen.

M. Lucien Magne recommenced his course of lectures on "The History of Architecture" at the Ecole des Beaux-Arts on Monday.

Lord Wolseley opened the exhibition of the Dublin Sketching Club on Monday.

The Civil Engineers will assemble in their old meeting-room on Tuesday next, to hear the address of the new President, as the new premises will not be ready for occupation until next year.

The Architect.

THE WEEK.

AN application has been made to the London School Board by the measuring surveyor, Mr. W. MURRAY, for compensation in respect of the overtime which was devoted by him in checking accounts of construction in cases that were under arbitration. "I had no choice," says Mr. MURRAY, "but to spend night after night for months, since the early days of the present Board to within the past few weeks, in getting up the cases for the arbitrator and in endeavouring to settle with the other contractors. To give your committee some idea of the amount of tedious labour involved, I may mention that there were no less than 1,466 items in dispute between the Board and three of your contractors, viz. ATHERTON & LATT, CHARTERIS, and DOVE BROS.; of the items in dispute with the other contractors I have no record, but they would be nearly proportionate. The overtime spent in going through the disputed items and preparing for the arbitrator, of which I have taken note, is 547 hours (equivalent to between sixteen and seventeen weeks' work), but there is a further considerable amount of time spent on going into items in dispute with the contractors who did not resort to arbitration, of which I have no record." The general purposes committee have recommended that 50% be awarded to Mr. MURRAY for his extra services.

THE Leeds School Board, in addition to some ordinary schools, are about to erect a school for blind and deaf-mute children. The basement will be arranged as a swimming-bath, the use of which will not be restricted to the children of the school. On the ground floor will be an assembly hall for the blind children, to be also used as a play-room and gymnasium, seven classrooms, each to accommodate fifteen children, four music-rooms, a work-room, cloak-room, a committee-room, matron's private room and a large dining-hall. On the first floor will be an assembly-hall for deaf-mute children, to be also used as a play-room, eight classrooms, each to accommodate fifteen children, a large work-room, a teacher's bedroom and the blind boys' dormitory. On the second floor will be the blind girls' dormitory, a teacher's bedroom, and a separate sick-room for boys and girls. There will be separate entrances and staircases for each section, and also separate playgrounds. Accommodation will be provided for 225 children (120 deaf-mutes, 105 blind), of whom 108 will be boarders. It is anticipated that the building will be one of the best-arranged of its class in England.

It is, we suppose, natural that the trustees of churches should endeavour to escape the liabilities imposed on them by the law. But the decisions are so definite, trustees may consider there is no opening left for them to evade their responsibilities. One of the latest instances came lately before the Bradford County Court. Mr. HILL, a slater, brought an action against the Rev. G. P. CLARKE, in his capacity of trustee of the Central Hall, Manchester Road, which was erected for Primitive Methodist purposes, to recover the amount of an account. It was not denied that the work had been done, nor that it was not performed in a satisfactory manner. The plaintiff had received the architect's certificate for the work, and the only answer to the claim was that the defendant was instructed that he had a legal defence, and would avail himself of it. The plaintiff stated that 120 yards of slating and 60 yards of eaves had been done over and above the contract, owing to a mistake in quantities. The counsel for the defendant observed that the matter was a serious one, as a sum of 500*l.* or 600*l.* was involved in the issue. He proceeded to argue that the defendant was bound only by the contract which had been executed. Judge GATES said he thought the defence was most unworthy and shabby, and not only that, but there was no defence in point of law. He therefore gave judgment for the plaintiff for the amount claimed. Defendant's counsel asked for leave to appeal, but the Judge, in declining, said

he would be laughed at in the High Court if he gave such leave. On economical grounds it will, therefore, be wiser for the trustees to arrange for the settlement of accounts outside the courts.

THE Corporation of Dublin intend to promote an Improvement Bill in the next session. Among the powers sought will be some for "the erection of a large and commodious public hall for the people of Dublin." The Irish capital is deficient in municipal buildings. The City Hall was erected for a different purpose than the accommodation of a Council and officers. Assuming that the Bill becomes law, a year at least must elapse before any arrangements can be made concerning the proposed building. It may be anticipated, however, that the design will be obtained by competition, and as there are no models available in Ireland, the Corporation cannot of course restrict the contest to local architects. As every visitor to Dublin is aware, the buildings which give interest to the city were the work of English architects.

THE colonnade which used to serve as a screen for the courtyard of Burlington House, before the Royal Academy and the associated societies took possession of the ground, was not very remarkable as a work of architecture, but it had some interest as the supposed work of an amateur, Lord BURLINGTON, and from the numerous references to it in the literature of the eighteenth century. It seems incredible that no place could be discovered for it in the Metropolis, and that the stones are left at Battersea without any protection. There is no doubt they have lost some of their qualities by the rough treatment they receive from children. Mr. W. WHITE, who from his association with Gothic work might be supposed to look on the masonry with unfriendly eyes once tried to rescue the columns. He says:—"On June 1, 1877, I visited them in Battersea Park and made a sketch design for their re-use in a church in the neighbourhood, proposing to employ them for the arcades, or colonnades, of the nave and aisles, using up the whole of the thirty-four columns, with caps and bases. The design was necessarily Italian in character, and not strictly English. The proposal fell through. But there seems no reason why some such scheme should not be set on foot and carried out now. A certain amount of maiming or mutilation in the stones, in order to preserve successfully these records of the past, might well be borne with, so that they were saved from the vandalism of scraping or whitewash." Since that time Classic work has risen in favour, and some effort should be made to utilise the columns. The French would find no difficulty in setting them up in the park in a position where they would enhance the picturesqueness of the grounds.

THE condition of the wall-paintings in the Houses of Parliament is almost enough to deter people from allowing similar attempts to be made in this country. Mr. W. B. RICHMOND says that "The durability of 'fresco,' or for the matter of that of all wall-painting, in whatever medium executed, whether it be size, egg, or even oil, depends upon the absolute dryness of the wall upon which the ground for painting is applied. If architects will give us dry walls, so constructed that damp neither rises, falls, nor penetrates, we can make use again of all the ancient methods of wall-painting with perfect security. If science will give us pure air in London those methods can be used there." In the Houses of Parliament the evil was not caused by damp walls, but rather by unsuitable paints and a defective method of using them. This is evident from the efforts which are being made by Professor CHURCH to make the figures visible. MACLISE'S *Meeting of Wellington and Blucher* and his *Death of Nelson* have had to be sponged and syringed in order to get rid of a coating of sulphate of lime that was formed by chemical action. HERBERT'S *Judgment of Daniel* and *Moses Bringing Down the Tables of the Law* are operated on with linseed oil, and DYCE'S paintings in the Robing Room, which were formerly treated with paraffin wax, will now need some other treatment. If the walls were defective, there would be no need to have so many varieties of restoration.

GIBBON AND ARCHITECTURE.

DURING this week the centenary of the death of EDWARD GIBBON, the historian, is being celebrated in a modest way. A few of his manuscripts, his snuff-box, sword, watch, playing-cards and other things have been collected and are to be seen in the British Museum. Compared with the shows which usually accompany celebrations, the display of relics does not appear of much importance, yet it is significant. Thirty years ago even so slight a commemoration of GIBBON could not be attempted. He was supposed to be the most un-English of all writers. It was asserted that he was afraid to be frank and that his meaning was a puzzle. Critics of repute did not hesitate to say that GIBBON was unable to write an English sentence, and it was proposed that his pages should be offered to students as exercises for translation into English. Then the supposition that his "Decline and Fall" was superficial, if compared with German histories, gave the finishing blow to his reputation. As one of the men whose mission it was to explain how histories should be composed, said, "GIBBON lived, longed, aspired, attempted, worked, slaved hard, wrote, published—and he was flattered, praised, read, bought, republished, perched up for immortality in stucco and in stone; and yet did he go down to the grave profoundly unaware, incurably unqualified to understand what this wreck of civilisation was whereon he has so elaborately pinpicked his name." After a decision of that kind, which expressed a common opinion, who could have expected that a lock of GIBBON'S hair, a caricature or two of him, some of his books of memoranda, letters and manuscripts, would become objects of attraction? The reverence which they have excited is only one of the signs of a reaction. A better knowledge of what can be done in writing history has convinced men that GIBBON is one of the greatest of historians, for he possessed not only the industry which is needed in order to arrive at facts relating to a remote age, but also the rare power which enables a writer to display the difference between the past and the present.

The criticism of an ordinary historian would be out of place in these columns, but there are circumstances connected with GIBBON which warrant an exception for his case. At a time when so many critics are endeavouring to explain why he deserved a "commemoration," it may be allowable to consider the subject from a standpoint that has been overlooked, but which has advantages.

In his fragmentary autobiography, GIBBON is proud to recall that the first member of his family who made a name for himself was an architect. Having mentioned his discovery that in 1326 the GIBBONS possessed an estate in the Weald of Kent, he goes on:—"Fourteen years after the first appearance of his name, JOHN GIBBON is recorded as the 'Marmorarius,' or architect, of King EDWARD III.; the strong and stately castle of Queensborough, which guarded the entrance of the Medway, was a monument of his skill; and the grant of an hereditary toll on the passage from Sandwich to Stowar, in the Isle of Thanet, is the reward of no vulgar artist." In these days when so much importance is attached to the remotest manifestations of heredity, it would be allowable to claim some of the qualities of the fourteenth-century "Marmorarius" for the author of the strong and stately history which above all others in the English language has an architectural character. But we need not contend whether GIBBON exemplifies atavism; all we care to suggest is that the memory of his ancient kinsman was not without extraordinary influence on his life.

Everybody knows how and when the thought came to GIBBON about undertaking his history. His own words are familiar:—"It was at Rome, on October 15, 1764, as I sat musing amidst the ruins of the Capitol, while the bare-footed friars were singing vespers in the Temple of Jupiter, that the idea of writing the decline and fall of the city first started to my mind." It is not, however, generally remembered that the idea was only what might be expected as a consequence of the course of study which GIBBON, in giving way to his own inclination, had gone through, and the task he was inspired to do was more nearly related to the ruins before him than what he realised. GIBBON did not contemplate so comprehensive a work as we now possess. Subjects like the "revolutions of Persia," "origin, progress and effects of the monastic life," "the character and doctrine

of MAHOMET," "origin and doctrine of the Paulicians," "first adventures and settlement of the Normans," "the Crusades," "the schism of the Greeks and Latins," "the character and coronation of PETRARCH," and countless others, by which the history of Europe was brought down to the sixteenth century, represented the growths around his original scheme which almost overshadowed it. What he was inspired to attempt was archaeological rather than political, for he tells us how his "original plan was circumscribed to the decay of the city rather than of the empire," and some years elapsed before he was seriously engaged in the execution of his more laborious undertaking. The ruins and the transformed temples appealed to GIBBON'S sympathies, as they would have to the old "Marmorarius," and he intended to do no more than explain how the changes were accomplished.

But the meditations amidst the ruins of the Capitol were in keeping with GIBBON'S own history. He considered himself to be also a wreck. In 1764 he was in his twenty-seventh year, but he was not without apprehensions about his future and feared that an old age awaited him without the fruits either of industry or inheritance. From his birth he was feeble, but he was a precocious child, and if he were allowed to follow his own bent from the first he might have been better educated. But in spite of his unfitness he was made to follow the common course. He always remembered that in his ninth year his want of strength and activity enabled the bullies of the school to revile and buffet him for the sins of his Tory ancestors. And he relates how, "at the expense of many tears and some blood, I purchased the knowledge of the Latin syntax." GIBBON would have hated Rome and its classics if his aunt had not fostered him. "Pain and languor," he says, "were often soothed by the voice of instruction and amusement; and to her kind lessons I ascribe my early and invincible love of reading, which I would not exchange for the treasures of India." His infirmities afterwards prevented him obtaining any systematic training, and in course of time he arrived at Oxford "with a stock of erudition that might have puzzled a doctor, and a degree of ignorance of which a schoolboy would have been ashamed." An English university in 1752 was about the happiest place for a wealthy young gentleman whose studies were desultory. GIBBON was allowed to do as he wished, and he asserted his independence by becoming a Catholic. Then he was sent to Switzerland where, if he did not regain his orthodoxy, he remedied some of the defects of his education. But on his return he was found to be unfitted to become a country gentleman. "I never handled a gun," he relates, "I seldom mounted a horse, and my philosophic walks were soon terminated by a shady bench." The fear of invasion made lymphatic temperaments like GIBBON'S become ardent, and he served for a time as a captain of militia, not without profit to him afterwards as an historian.

GIBBON was not at ease in England, and he returned to Switzerland on the first opportunity. His own will began to be exercised. The sight of a collection of medals and coins opened for him a new field in which antiquity appeared as a real world, and he resolved to undertake an expedition in which he could study the topography of Rome, the ancient geography of Italy and the science of medals. It was a remarkable desire in a man of his figure, for GIBBON was like HAMLET, fat and scant of breath. He made an itinerary of Italy that resembled one of the English road books, filled a commonplace book with topographical notes and utilised engravings of medals for illustrations. The "tame and tiresome uniformity" of Turin did not satisfy him, nor the marble palaces of Genoa. But in Rome he admits that his passionless mind was agitated from the very moment of his entrance, and several days of intoxication were lost or enjoyed before he could descend to a cool and minute investigation. GIBBON spent eighteen weeks, accompanied by a Scotch antiquary, in examination of remains before he felt himself qualified to select and study examples of art. He was not like one of the ordinary fine gentlemen who performed the Grand Tour. GIBBON was most eager at an early time to obtain some knowledge of the remains of antiquity, but neither in England nor in Switzerland was it practicable. Thus in the French essay on the "Study of Literature," which was his first attempt,

he exclaims, "Why am I not a CAYLUS or a SPENCE? Then would I raise an eternal monument to the alliance of art and literature. In it should be seen the image of JUPITER developing itself in HOMER'S brain and coming to lie beneath the chisel of PHIDIAS. But I cannot with CORREGGIO say to myself, 'I, too, am a painter.'"

His studies had afterwards enabled GIBBON to acquire a knowledge of some kinds of art, and more particularly of architecture, which was deeper than that of CAYLUS or SPENCE. It is still easy to discern in the massive "History of the Decline and Fall of the Roman Empire" traces of the first inspiration of the author. The climax of the work which forms the concluding chapter altogether relates to architecture. He begins by saying that "In the last days of Pope EUGENIUS IV. two of his servants, the learned POGGIUS and a friend, ascended the Capitoline Hill, reposed themselves among the ruins of columns and temples, and viewed from that commanding spot the wide and various prospect of desolation. The place and the object gave ample scope for moralising on the vicissitudes of fortune, which spares neither man nor the proudest of his works, which buries empires and cities in a common grave; and it was agreed that in proportion to her former greatness, the fall of Rome was the more awful and deplorable." Then he goes on to explain how there were four causes of destruction—the injuries of time and nature, the hostile attacks of the barbarians and Christians, the use and abuse of the materials and the domestic quarrels of the Romans. GIBBON was a master of composition and he felt that this picture of the decline and fall would not be effective if it were restricted to mortal beings who cannot be imagined to have more than a brief existence. By making great buildings share in the catastrophe the destructive power appears more terrible and the author's aim as an advocate of pessimism is attained.

To dwell only on buildings in ruins would be monotonous. GIBBON was no less eager to represent them in all their glory. He shows how pride, patriotism, religion and other qualities were expressed by means of architecture, and that accordingly buildings are for the historian the most important of memorials, although so constantly neglected. Thus in one place he says:—"Among the innumerable monuments of architecture constructed by the Romans, how many have escaped the notice of history? How few have resisted the ravages of time and barbarism? And yet even the majestic ruins that are still scattered over Italy and the provinces would be sufficient to prove that those countries were once the seat of a polite and powerful empire. Their greatness alone or their beauty might deserve our attention; but they are rendered more interesting by two important circumstances which connect the agreeable history with the more useful history of human manners. Many of these works were erected at private expense and almost all were intended for public benefit." He gives several examples of the munificence which hesitated at no outlay whenever a public building was to be erected.

In considering his descriptions we should not forget the difficulties which surrounded him. Nowadays, when views of buildings in all parts of the world are to be acquired for a trifle, it is not easy to realise that a century ago a student who was unable to travel could only imagine the appearance of the buildings in his own country. The creative power of a historian will not be of much avail when he treats of architecture. We must therefore often accept GIBBON'S numerous accounts of buildings as tokens of goodwill towards architecture and of his desire to suggest its impressive power rather than as accurate representations. He was enabled by means of ADAM'S engravings to obtain an accurate notion of DIOCLETIAN'S palace at Spalato, and in consequence he was able to give the following description of the group:—

It covered an extent of ground consisting of between nine and ten English acres. The form was quadrangular, flanked with sixteen towers. Two of the sides were near 600 and the other two nearly 700 feet in length. The whole was constructed of a beautiful freestone, extracted from the neighbouring quarries of Trau or Tragutium, and very little inferior to marble itself. Four streets, intersecting each other at right angles, divided the several parts of this great edifice, and the approach to the principal apartment was from a very stately entrance, which is still denominated the Golden Gate. The approach was terminated by a peristylum of granite columns, on one side of which we discover the square Temple of Æsculapius, on the other the octagon Temple of Jupiter. The latter of those deities

Dioctletian revered as the patron of his fortunes, the former as the protector of his health. By comparing the present remains with the precepts of Vitruvius, the several parts of the building, the baths, bedchamber, the atrium, the basilica, and the Cyzicene, Corinthian and Egyptian halls, have been described with some degree of precision, or at least of probability. Their forms were various, their proportions just, but they were all attended with two imperfections, very repugnant to our modern notions of taste and convenience. These stately rooms had neither windows nor chimneys. They were lighted from the top (for the building seems to have consisted of no more than one storey), and they received their heat by the help of pipes that were along the walls. The range of principal apartments was protected towards the south-west by a portico of 517 feet long, which must have formed a very noble and delightful walk, when the beauties of painting and sculpture were added to those of the prospect. Had this magnificent edifice remained in a solitary country, it would have been exposed to the ravages of time; but it might, perhaps, have escaped the rapacious industry of man. The village of Aspalathus, and long afterwards the provincial town of Spalato, have grown out of its ruins. The golden gate now opens into the market-place. St. John the Baptist has usurped the honours of Æsculapius; and the Temple of Jupiter, under the protection of the Virgin, is converted into the cathedral church.

In this case there is as much exactitude as could be expected in a history. The characteristics selected are those which are most likely to impress readers who are not acquainted with the details of architectural styles. It is also made subservient to GIBBON'S endeavour to substantiate a charge of Vandalism against the Christians. Much of the effect in the description of Spalato depends on the big dimensions. Let us take another case, viz. ATTILA'S village and palace, where there were no plans or dimensions to guide GIBBON, and he was compelled to depend on the vague and obscure words of PRISCUS:—

In its origin it could be no more than an accidental camp, which, by the long and frequent residence of Attila, had insensibly swelled into a huge village for the reception of his court, of the troops who followed his person, and of the various multitude of idle or industrious slaves and retainers. The baths constructed by Onegesius were the only edifice of stone; the materials had been transported from Pannonia, and since the adjacent country was destitute even of large timber it may be presumed that the meaner habitations of the royal village consisted of straw, of mud or of canvas. The wooden houses of the more illustrious Huns were built and adorned with rude magnificence, according to the rank, the fortune or the taste of the proprietors. They seem to have been distributed with some degree of order and symmetry, and each spot became more honourable as it approached the person of the sovereign. The palace of Attila, which surpassed all other houses in his dominions, was built entirely of wood and covered an ample space of ground. The outward enclosure was a lofty wall or palisade of smooth square timber, intersected with high towers, but intended rather for ornament than defence. This wall, which seems to have encircled the declivity of a hill, comprehended a great variety of wooden edifices adapted to the uses of royalty. A separate house was assigned to each of the numerous wives of Attila, and instead of the rigid and illiberal confinement imposed by Asiatic jealousy, they politely admitted the Roman ambassadors to their presence, their table and even to the freedom of an innocent embrace. When Maximin offered his presents to Cerca, the principal queen, he admired the singular architecture of her mansion, the height of the round columns, the size and beauty of the wood which was curiously shaped, or turned, or polished, or carved; and his attentive eye was able to discover some taste in the ornaments and some regularity in the proportions.

The latter may be taken as corresponding with the numerous attempts of GIBBON to restore ancient buildings by the aid of insufficient data. In our busy time we are afraid they are the parts of the history which are most often skipped. GIBBON could not expect that many of his contemporaries would take the trouble to peruse them. He possessed a weakness for an ancient building, and it gratified him to attempt descriptions of temples and palaces which he could never expect to behold. In the respect he shows towards architecture EDWARD GIBBON stands almost alone, and on that account we should overlook some of his defects of treatment, for it may be said that he displays far less warmth in describing men than he bestows on buildings. His affection may be judged from the remarkable passage where he becomes an apologist for the cruelty of the Emperor MAJORIAN, because it was exercised on those who destroyed old buildings. He says:—

The monuments of consular or imperial greatness were no longer revered as the immortal glory of the capital, they were only esteemed as an inexhaustible mine of materials cheaper and more convenient than the distant quarry. Specious petitions were continually addressed to the easy magistrates of Rome, which stated the want of stones or bricks for some necessary service; the fairest forms of architecture were rudely defaced for the sake of some paltry or pretended repairs; and the degenerate Romans who converted the spoil to their own emolument, demolished with sacrilegious hands the labours of their

ancestors. Majorian, who had often sighed over the desolation of the city, applied a severe remedy to the growing evil. He reserved to the prince and senate the sole cognisance of the extreme cases which might justify the destruction of an ancient edifice; imposed a fine of fifty pounds of gold (two thousand pounds sterling) on every magistrate who should presume to grant such illegal and scandalous license; and threatened to chastise the criminal obedience of their subordinate officers by a severe whipping and the amputation of both their hands. In the last instance the legislator might seem to forget the proportion of guilt and punishment; but his zeal arose from a generous principle and Majorian was anxious to protect the monuments of those ages in which he would have desired and deserved to live.

GIBBON may have imagined that the Kentish "Marmorarius" would have been no less rigorous.

NOTES ON THE GREAT RAILWAY STATIONS OF LONDON.—III.

[BY A CORRESPONDENT.]

THE terminus of the London, Brighton and South Coast Railway at Victoria has one advantage externally over the neighbouring station, in the fact that attention is diverted from the ugliness of its end by the covered erection for vehicles in front. There is nothing of that kind at the London, Chatham and Dover building. The Grosvenor Hotel also acts as an effectual stop to the northern side of this station, instead of the awkward skew and finish next the Wilton Road to the other example. The mode of roofing employed to the London and Brighton Station is on very different lines to that of some of the other large termini, as the spans are arranged transversely to the axis of the station. The very usual plan of dividing it longitudinally into two equal sections has been adopted, the wreathed columns, carrying brackets with perforated foliated spandrels, standing in the centre of the broad roadway for vehicles, without their in the least getting in the way. The very deep lattice girders on which the roofs pitch form a most conspicuous feature in the design of this station, the braces being very slightly ornamented and having bosses at the intersections. As compared with many of the other examples the height up to the plate is little, and the construction of the roof trusses of a simple and light character. There is nothing objectionable, but on the other hand there is nothing grand within this terminus.

The Charing Cross Station of the South-Eastern Railway is externally nothing more than a huge shed, but the fine Hotel facing the Strand makes an imposing appearance to the entrance front, which is enhanced by the spacious paved yard and the elegant Queen Eleanor Cross, as well as by the handsome, substantial enclosure railings. The west side of the station is little seen from the outside, but that on the east towards Villiers Street is sufficiently apparent. It is windowless, but divided into wide panels with semicircular red brick gauged arches, the whole treated in a simple and effective manner. It is difficult to see how more could have been made of it without a very large expenditure over so extensive a superficial area. The best treatment of blank walls of this kind is no easy matter, and the art is neither to do too little nor too much—there is the rub. The interior of this station is imposing owing entirely to its great width and length, all open to view at one glance. The construction of the iron trusses is wonderfully light and there is no attempt at ornament. Yet withal, the effect is none the worse, for misapplied decoration is no improvement, but the reverse. Moreover, owing to London dirt, steam and smoke any embellishment at so considerable a height would have been positive waste. At the same time, at the point where the roof springs from the walls, the very crude aspect caused by the absence of frieze or cornice here might have been avoided, as any slight ornament set in so legitimate a position would have been well seen. On the east side of the station, where a wing of the Hotel occupies its northernmost end, the way in which the roof is trimmed so as to allow of the insertion of some windows is very awkwardly managed. A Mediæval architect of the olden time would have created a beauty instead of a blemish where he came across any such difficulty. There are hundreds of such examples, still happily existing, of picturesque features originated in this manner. As for the treatment of the side walls with a series of semicircular arched recesses having piers between, any good effect these might have had is

ruined by the whole of the panels being filled in with obtrusive advertisements. But it is useless enlarging on this very patent and universal nuisance. The best part of the station, viewed internally, belongs rather to the Hotel, the south side of which has two balconies on the first-floor level, the projection of which serves much to break the monotony of this end of the building. The blank wall above, up to the ridge of the roof, is also treated in a very simple though effective manner.

What has been remarked about the Charing Cross terminus will to a great extent apply to the Cannon Street Station, as the plan is much the same, with the Hotel on the north side, and belonging to the same railway company, though the dimensions rather exceed the first named. The exterior of the side walls, less seen on the whole than at Charing Cross, are treated in a very similar way, except that there are some windows, and the arches are all in ordinary stock, not red, bricks, the whole being simple and effective, without any affectation of ornament—one of the besetting snares of too many civil engineers. Internally the construction of the roof is very like that at Charing Cross, but instead of the one little panelled wood roof in the centre, there are in this instance two of them, leaving glazing in the highest part. As regards the north end of the station, or south side of the hotel, this is more ornamentally treated and elaborate than at Charing Cross.

When the Victoria terminus of the London, Brighton and South Coast Railway was built it was predicted that London Bridge would become a mere roadside station. As far as the South-Eastern line is concerned, this has to some extent been realised, as can be gathered from the dimensions of the station belonging to that company. But the other company possess an enormous building for the main line and suburban traffic, reconstructed on modern lines. To stand here as a spectator on an ordinary weekday afternoon between five and six o'clock is almost a revelation, to even one accustomed to the traffic at the larger London stations, for there is an incessant stream of City men hurrying or running to save their trains to their suburban homes. It is believed that that part of the old terminus lying between the high level of the South-Eastern and the London and Brighton Railway is utilised as a goods dépôt, appearing a veritable survival of the primitive railway station, the trusses of the roof being entirely of great timbers, without any ironwork, and of queen-post construction. Barring its necessarily dirty condition owing to its use, the general effect of this old roof is not at all amiss. Just a word about the exterior—and it is curious, by the way, to observe how extremely diverse are the several sites and surroundings of these great termini. In this instance the station has a good open space at its front or west end, but is "engaged" on the north and south side, the former being masked by the South-Eastern Station on the higher level, while the south side is encumbered by other buildings. The entrance front is an odd conglomeration, and could not by any means be called a façade, being too irregular. It really has no architectural pretensions whatever. There is no Hotel annexed, the upper part of the building being occupied by offices. The station proper behind consists of the main-line portion, with its segmental circular roof, and, besides, the very large annexes on either side having span roofs at right angles to the central station. There are iron arched, braced, ornamental trusses longitudinally, with spandrels having carving, which rest on handsome columns. The roofs of the annexes run into that of the central station, and the curved mitreing in this case has rather a pleasing effect. Looking above the wall-plate level there is really nothing ornamental in the roof construction, nor any particular novelty in it. But the general proportions of the interior are pleasing, and the station is lofty.

The terminus of the North London Railway, Broad Street, City, has a heavy looking though somewhat imposing front, of no striking architectural pretensions. But the lower part is so obscured by the covered way for vehicles and by the several staircases up to the station on the high level, that one's attention is taken off the upper part. The best feature in the exterior is really the rather pretty open staircase with small semicircular arches carried on columns, gradated up to the top, on the east side. The treatment of the blank side wall adjoining the Great

Eastern Station is also good, the only perforations being to the tympana of the panelled arcade. As to the interior of this station there is very little to say, for it is of the ordinary simple type, consisting of two span roofs side by side, like other London stations, except on the south end, where it is roofed north to south.

The Ludgate Hill Station of the London, Chatham and Dover Railway has a rather imposing façade in a kind of Romanesque style towards Bridge Street, Blackfriars, and to an outsider certainly gives an impression of a much more important building than it really is. Perhaps it would be unjust to call it a sham front, but it certainly gives the impression of a ground-floor and first-floor, the upper part having windows, and in other ways appearing as if there were rooms or offices. Though the writer knows London well and has lived there since this station was built and often seen its exterior, it was only a short time since he went inside and discovered the illusion. The front towards Bridge Street is practically a screen wall masking the very ordinary wood tie-beam roofs behind. Beyond this there is no fault to find in this honest composition of stock and red bricks and terra-cotta, with its parti-coloured bands at intervals, its boldly projecting twin chimney-shafts and its massive turrets. Terra-cotta in this case was used during the infancy of the revival of this anciently-known material, but the little stamped patterns on some parts of it are by no means effective. There is also in this station that old Italian Gothic conceit, affected too by no less an authority than the late George Edmund Street at one period of his life, of an arch with a semi-circular intrados and a pointed extrados, or, to put it in simpler words, the deeper voussoirs at the crown diminishing down to the springing thereof, a construction at one time erroneously supposed to confer strength—an exploded idea now. Entering the station on the ground-floor booking-office level and going up the steps to the platforms, the discovery is made how the windows are mere openings in the side walls of an open place, and that there are no rooms whatever—it is very like a goods station. However, possibly, when the dividends of the London, Chatham and Dover Railway are higher, all this will be improved. Externally, owing to the station facing a great thoroughfare and being well set back with a good yard in front, it possesses a decided advantage over others of equal importance but less happily situated.

The Holborn Viaduct Station, being a terminus, would naturally be considered more important than the last-mentioned "wayside" station, but in reality seems scarcely so. The space assigned for vehicles is very limited, and as regards the roofing generally it is of the stereotyped order. The architect in this case, taking the buildings as a whole, certainly scores an advantage over the engineer, for by far the best part of the whole affair is the Hotel, which, owing to its situation, more completely masks the railway station than in other cases. The writer has previously refrained from commenting on this kind of Hotel, but in the present example the quiet refined type of Renaissance, though without any very striking features, is most refreshing to observe as compared with the vulgarity of many such buildings. But this was to be expected when the influence of Mr. FLORENCE, one of the firm of the architects to this and the Hôtel Victoria, Northumberland Avenue, had been bestowed on the composition.

(To be concluded.)

ROOD LOFTS IN CHURCHES.

IN the Consistory Court of Norwich, before Mr. Blofeld, the chancellor, an application was made in October by direction of the bishop of the diocese, on behalf of the vicar and churchwardens of St. John, Timberhill, for a confirmatory faculty for a chancel screen with rood loft and gates, and also for a rood beam, upon which were placed the figure of our Lord upon the Cross, and figures of the two Marys, St. John and the Roman Centurion, some of which had been erected so far back as 1895 and other parts during the period when the see of Norwich was vacant. There was no opposition on behalf of the parishioners, the bishop, or any one in the diocese, but as it was the first case of the kind in the diocese it was argued at length before the Chancellor in the Beauchamp Chapel on October 12, when the Chancellor reserved judgment.

The point raised in argument was that neither a crucifix nor images were *per se* unlawful, but only if they were liable by their position or surroundings to foster superstitious worship or devotion. The decisions of the Privy Council in the Exeter case, *Philpotts v. Boyd*, and the Denbigh *eredos* case before Lord Penzance were relied upon, and the learned judge's decision in *Bradford v. Fry*, as adopted by the Privy Council, was mentioned. The Chancellor asked, as a matter of fact, whether all rood lofts had not been removed in Edward VI.'s or Elizabeth's reign. Sir Walter Phillimore admitted their destruction and that of all images, superstitious or otherwise, but pointed out that the only images preserved were those of local worthies for whom no saintly character was claimed. A rood loft or rood beam was not unlawful, and so long as the figures thereon were the representation of an historic scene in Holy Scripture they were covered by the decision of the Privy Council in *Philpotts v. Boyd*, and the *dicta* of Lord Justice Lindley on crucifixes and crosses in the St. Paul's *eredos* case and the decision of Lord Halsbury in the House of Lords. As to chancel gates, the whole question was one of discretion. They were not removed from St. Paul's, Knightsbridge, in *Westerton v. Liddell*, and Dr. Tristram had summed up the law and the practice in a recent reported decision. Gates were needed where churches were left open, as this one was, all day for purposes of private devotion. The Chancellor gave judgment on Saturday last. A faculty to confirm the erection of the rood loft and of the figures at present on the rood beam, and to authorise the placing of the other figures there, was refused; and a faculty to confirm the erection of the screen without the rood loft, and to authorise the placing of gates in the existing screen, the erection of the proposed side screens with gates in them, and the erection of the choir stalls and screen behind them, was granted. Notice of appeal was given.

ARCHÆOLOGY IN HONDURAS.

THE following particulars of a remarkable archæological discovery at Santa Rita have been furnished by Dr. Gunn:—

A rough stone wall was first discovered and on excavating by the side of this a projecting cornice came to light. Beneath this cornice was a frieze of painted stucco, consisting of figures in red, blue and yellow on a blue blackground and outlined in black. To the right was a figure of the Toltec god Quetzalcoatl; next the figure of a warrior holding in his upraised right hand a crucial instrument, opposed to a similar instrument in the hand of another warrior; and to the extreme left a mass of complicated hieroglyphics. The whole of this work of art was unfortunately destroyed by some mischievous persons in my absence. On excavating further, another wall came to light, at right angles to and connected with the first. This also was covered with figures, four of which have at present been brought to light. The whole work is most artistically executed, both in colouring and design, and is undoubtedly of Toltec origin, from the close resemblance of the figures to those of Palenque, Uxmal and other Toltec cities, both in attitude, execution and the style of dress, viz. jewelled and plumed head-dress. Beneath the first layer of stucco are two other separate layers, each bearing traces of colour; and as we know the Toltecs renewed the stucco on their temples at the end of each "lesca age" of fifty-two years, the temple must have been standing for from 104 to 156 years before it was covered by the mound. As to the time it has been buried, it is almost impossible to fix it at all accurately. This is, I believe, the only case in which a Toltec work of art has been brought to light in a similar state of preservation, as those of Palenque, Mitla and other cities present merely traces of colour, as from long exposure to the weather the brightness of the colouring fades, the plaster crumbles; and, unless some means are taken to preserve it, this unique monument of a vanished race will soon be, with its constructors, a thing of the past.

TESSERÆ.

The Symbolism of Gothic.

IT has been said that the Gothic cathedral borrowed much from the arts which preceded its birth. This is true; it is a reproach which it accepts as one glory the more. As theology moulded the ancient philosophies and human sciences to aid in the erection of this its divine monument, so Christian architecture borrowed from the ancient world all its various elements, to transfigure them and penetrate them with a new life. The Indian temple, symbol of the secret working of nature, there divests itself of its shapeless pantheism and appears displayed in all the magnificence of its complete development; the Egyptian tomb there clothes itself in the

mysterious splendours of immortality; the Grecian column breaks the stiff, unbending straightness of its pediments, to mount more freely up to heaven; the Roman arch springs on high more boldly upon the curves of the aspiring ogive; with no less power does Christian architecture assimilate to itself the Byzantine dome and the exuberance of Arabian creations. Of so many differing forms it frames one only form, the innumerable parts of which embrace, invoke and mutually produce each other, blending together in the unity of one living body. Behold the wondrous product of the Christian mind. This it is that breathes in every part and remounts to heaven, its primal source; it draws with it heavenward all the coarsest elements—yea, creation's self. The arches climb aloft on their aerial way, and higher still, and from all points at once the spires shoot upward into boundless space, as symbolising in their flight the sublime extravagance of ecstasy; it is the aspiration, incessant and eternal, of creation towards the Creator.

Westminster Hall.

The roof of Westminster Hall was put up between 1395 and 1399, time of Richard II. It is reported that about the year 1560 and for a century before the English had exported vast quantities of oak from Ireland, and it would appear that Irish oak was appreciated at a still earlier epoch, for "A record in St. Michan's Church, Dublin, which is verified by 'Hammer's Chronicle,' in the library of Trinity College, states that the faire greene or commune, now called Ostomontowne Green (now Oxmorton), was all wood, and hee that diggeth at this day to any depth shall finde the ground full of great rootes. From thence, anno 1098, King William Rufus, by license of Murchard, had that frame which made up the roofes of Westminster Hall, where no English spider webbeth or breedeth to this day." Of course the extract does not allude to the present roof of the Hall, but in support of the probability of its being oak, as now generally asserted, and not chestnut, "Tradition," says Hayes, "gives the Shillela oak (a district in the county Wicklow) the honour of roofing Westminster Hall and other buildings of that age; the timbers which support the leads of the magnificent chapel of King's College, Cambridge, as also the roof of Henry VII.'s Chapel in Westminster Abbey, are said to be of oak brought from these woods, and I think it by no means improbable that the superior density and closeness of grain which is the character of the Irish oak, particularly in high situations and a dry soil, as may appear by comparing its specific gravity with that of other oak, added to the inattention of the Irish at that time to the article of bark, which permitted their oak to be felled in winter, when free from sap, might have induced the English architects to give it the preference in such material works, and it must be allowed that the present unimpaired state of these roofs, after so many centuries, seems very well to warrant this conjecture. It is generally understood that a sale was made of the finest timber of Shillela which remained in Charles II.'s time, into Holland, for the use of the Stadthouse and other buildings, constructed on piles driven close together to the number of several hundred thousand. In 1669 William Earl of Strafford furnished Laurence Wood, of London, with such pipe staves, to a great amount, at 10 $\frac{1}{2}$ per thousand, as are now sold for 50 $\frac{1}{2}$, and are only to be had from America. The year 1692 introduced into Shillela that bane of all our timber, iron forges and furnaces . . . and it is inconceivable what destruction they must have made in the course of twenty years, which was the term of their contract." Another authority for the present roof being of Irish oak is Barclay, who in his "Icon Animorum," published in 1614, and dedicated to Louis XIII. of France, mentions that the timber of Westminster Hall was brought from Ireland. Rees's "Cyclopædia," article "Westminster," contradicts its being of Irish oak, but states it to be of chestnut from Normandy, and Nightingale, in the "Beauties of England and Wales," declares that it is built of chestnut supported by ribs of oak. The Irish oak, however, was employed by Charles V. (who reigned in France as contemporary with our Richard II.) for the roof of the library of the Louvre; and it is so stated by L'Abbé Sallier, in the introduction to the catalogue of the "Bibliothèque du Roi" (of which the Louvre library was the commencement), and this observation has been copied by later writers. Consequently it may be inferred that Irish oak may have been used at Westminster.

Cast-iron Girders.

The first application of cast-iron girders to any extent was in the erection of floors of a fireproof mill constructed by Messrs. Philips & Lee, of Manchester, in 1801. The mills were of very considerable extent, being 142 feet long, 42 feet wide and seven storeys high. The floors were supported by a double row of columns situated 9 feet apart, extending the whole length of the building; resting on these were girders of the parabolic shape by Boulton & Watt, 14 feet long by 13 $\frac{1}{2}$ inches deep, the space between them being spanned by brick arches resting on the bottom flanges of the girders. These

arches were 9 inches deep at the springing, 7 $\frac{1}{2}$ inches for a short distance on each side and half a brick, or 4 $\frac{1}{2}$ inches, at the crown. From 1801 to 1824 very few alterations were introduced either in the section of the girders or in the designs of the floors themselves, and for more than twenty years the mills of Messrs. Philips & Lee were usually taken as a model for structures erected upon similar principles; nevertheless, during the interval just alluded to, the properties of cast-iron were made the subject of many interesting researches by Tredgold, Fairbairn and others, the results of which had considerable influence in increasing the confidence of both engineers and architects in the value of that metal for building purposes. During that period many important improvements were also introduced in the art of casting, and girders of considerable dimensions became of frequent occurrence; among those we may mention the beams used to carry the floors of Buckingham Palace, many of which were from 35 to 36 feet in length. In 1824 Mr. Rastrick recommended to Sir Robert Smirke (then Mr. Robert Smirke) cast-iron girders for supporting the floors of the British Museum, in lieu of the trussed beams previously proposed by that gentleman. These girders, which were subsequently adopted, are 41 feet long, 3 feet 6 inches deep at the centre and cast with an open web. Before being employed they were each tested with a dead weight of from 15 to 20 tons, placed at their centre, and have since proved to be in all respects successful. It was about this period that Mr. Hodgkinson commenced his interesting experiments, among other results of which was the determining of the section combining the greatest strength with a minimum amount of metal. With a view of economising metal by employing beams of equal strength throughout, it is usual to reduce gradually their sectional area from the centre to the extremities; thus in girders employed for carrying floors the strain being in most cases equally distributed, the depth ought to vary in proportion to the ordinates of an ellipse, all the other dimensions remaining constant, and when it is advisable to preserve an equal depth throughout, the same effect can be obtained by increasing the breadth of the flanges in proportion to the ordinates of arcs of parabolas; this latter method has the advantage of economising more metal and also of obtaining greater rigidity. When the sections of the beam at various points are similar, the depth of the beam and the breadth of the flanges are determined by curves of the cubical parabolic form. Theoretically, the variable dimensions would disappear altogether at the extremities of the girder, but in practice it is necessary to provide against the direct shearing strain and also to obtain a firm bedding on the supports; this can be done only by modifying the shape of the girder.

Ozias Humphrey, R.A.

Ozias Humphrey was a charming painter of miniatures; his colour is as brilliant as Petitot's and yet marked by the same exquisite tonality, whilst the labour he bestowed on the finish of the surface almost rivals the result obtained in the kiln of the enameller. He belonged to an old family at Honiton, in Devonshire, that county which has contributed so largely to the brethren of the brush. He first studied with Samuel Collins, an indifferent miniaturist and a very worthless fellow. Collins fled from his creditors and young Humphrey returned to Honiton. Determined to make his way, he borrowed a guinea from his mother and set out on his travels, first to Exeter and then to London, where he entered Shipley's drawing school, at that time the centre which attracted all the men who afterwards became famous. Thence he went to Bath, and lodged with Linley, the musician, whose lovely daughter, afterwards Mrs. Sheridan, then in her ninth year, but already possessing the sweetest of voices, cheered his painting hours by singing to him. After remaining at Bath for some time he returned to London, and being a devoted admirer of Reynolds, boldly showed him some of his miniatures. When Reynolds heard that he was from Devonshire and that his mother was a lace-maker, he exclaimed, "Born in my county, and your mother a lace-maker. Why, Vandyke's mother was a maker of lace!" and immediately took the young painter under his protection. He rented lodgings near his patron at 21 King Street, Covent Garden, and soon got into the full tide of work. In 1773, broken-hearted by the refusal of James Payne, the architect, to accept him as the suitor of his daughter, he determined to travel, and visited Rome with Romney. After an absence of four years he returned to England, and soon after he received by post one morning a letter from Dr. Wolcot (better known as Peter Pindar) dated from Truro, asking him as a personal favour to receive into his house "an uncouth, raw-boned, country lad," about fifteen years of age, with whom he had encumbered himself, and (to use the Doctor's own words) who had "run mad with paint." This youth offered his services to Mr. Humphrey to clean his brushes and palettes and to make himself useful in the common concerns of his house without wages, and all for the pleasure of being with a painter of his knowledge and eminence. The raw-boned lad afterwards became the celebrated John Opie, R.A., and lecturer

on painting to the Royal Academy. In 1785 Humphrey went to India and painted the Rajahs and Begums. In 1788 he returned to England and resumed his profession, and in 1790 was chosen a member of the Royal Academy. He died in March 1810. Romney painted a remarkably fine likeness of him, now at Knowle.

The Freemasons and Mediæval Art.

Architects are apt to forget that by the very fact of copying their predecessors of the Middle Ages, they become most unlike them in that particular circumstance which is the life and soul of all material art, the principle on which it is carried on. The present generation endeavours to recover, like a dead language or a lost science, what the men of old exercised as a living, progressive, self-developing thing. We have, indeed, the body, decayed and worn out as it is, but they had the spirit which quickened it. It is a mistake to suppose that that spirit was identical with, or even the necessary result of, the Mediæval faith. The two things are quite distinct in themselves, as is evident from the fact that we retain the latter, while we had utterly lost and are now only recovering the former. Gothic architecture was immediately and essentially suspended by the dissolution of the Freemasons, in whose hands it was vested like a vast monopoly, rather than by the rupture in the unity of the Christian Church which took place in the sixteenth century. Without such an organised system as that wonderful confraternity supplied, no amount of religious feeling or enthusiastic faith could have achieved the great ecclesiastical works of the Middle Ages, because (as at present) it would have been unable, so to speak, to embody itself in any definite, methodical, scientific way. At the present time few men of genius supply a want and, as it were, a vacuum in the department of ecclesiastical art which was unknown and unfelt in the days of the Freemasons. Our bond of unity, so far as it exists in giving the preference to a particular style, is nothing more than a common consent to admire and copy their works. What, indeed, but a kind of rivalry to be foremost in reviving a lost art could now insure anything like an agreement or uniformity in building and decorating churches? Where each one strives to be the best copyist of an existing model it is obvious that at least a very close approximation to uniformity will be the result. But this uniformity is a totally different thing from that which formerly prevailed through the influence of co-operation and the restrictions of actual rule. It is just as different as the voluntary and independent attempts of five or six fellows of colleges to imitate the old monastic life would be from the working of an actual religious community living under the ancient rule. In the one case monasticism is a thing extinct or at least merely traditional, in the other it is a living reality. So it is with modern church building; the selection of a style is arbitrary, and it is only to a general movement and a kind of fashion (induced no doubt by the best feelings of love and reverence for the mighty past) that we owe the improved character and furniture of the churches which we see rising everywhere around us. Of the history, organisation, rules and craft of the ancient Freemasons next to nothing is known. But we cannot contemplate their works without being filled with amazement at the perfection of a system which for many centuries together could cover the face of Europe with buildings wherein every detail was, for the time being, in the strictest unison, a system under which every advancement and improvement of the art was spread simultaneously and adopted unanimously by the working thousands throughout a wide Continent. Not but that Christian architecture had national developments, or rather, perhaps, took national directions according to climate, material and other external circumstances. For instance, the Early English and the contemporaneous continental Geometric-Decorated, our Perpendicular, and the gorgeous Flamboyant of our neighbours are instances of these diverging tendencies, though all are essentially subordinate to one rule and evidently animated by one spirit.

Cologne Cathedral.

The cathedral is too glorious a work for description. Regular in plan, and almost uniform in detail, it does not afford much for the note-book. The impression that it gives is a whole—one of inexpressible grandeur and beauty. In this respect it is like St. Peter's, that the first glance can in no degree appreciate its scale. The proportions are vast, but most accurate and beautiful, so that at first they only satisfy, and it is long before they begin to astonish. It is curious that one feels as if one had very soon seen the cathedral. Unlike St. Mark's at Venice, for example, where every part and detail seems to detain the visitor, Cologne only impresses with one great effect. Even if a long time be consumed in the church, it is not in the examination of a number of interesting points, but in a contemplation of the whole. The mind expands and soars away in this prodigious temple, forgetful of minute particularities. The eye sees rich details, gilded capitals, coloured imagery, gorgeous windows, but rests on none of them. These are rejected as being sub-

servient to the great idea, or rather they are not rejected, for they are too humble and well ordered to be obtrusive. They are just where and what they ought to be—necessary but quite subsidiary parts of the design, and claiming to be no more. It is just as in the solemn performance of the ritual of the altar, where there are many degrees of ministers, each in his duty and order and dress and local position contributing to make up the whole act of sublime worship. It would be wrong if one knee knelt too many, one taper flashed needlessly, one censer swung too prominently. The rapt worshipper sees all and yet sees none. All he sees and feels is, that in the very beauty of holiness the highest service man can offer is being rendered in the divine liturgy. So the unknown designer of Cologne made every art and even substance minister as it were a rational service in its appointed subordination around the material altar for which he, a true poet, made this material shrine. He has fixed and embodied a heavenly vision. He conceived a not unworthy temple for Him whom the heaven of heavens cannot contain, and we see in wood and stone the expression of his sublime thought. His poem presents to us a master-harmony, in which metal and stone and wood, and every art that moulds them, combine to praise and glorify the Lord; and his work exalts the soul to adoration much in the same way as does the sublimity of an Alpine range. A glorious view of what we call external nature can certainly elevate our souls towards heaven. Much more so can Christian art.

Inlay in Italian Gothic.

Much of the peculiarity of Italian Gothic is produced by the introduction of flat surfaces for the display of mosaic or of painting. Their profusion of marbles has led them to cover whole buildings with slabs disposed in panels, or alternate horizontal stripes of various colours, producing to English eyes the most disagreeable effect, while the limited thickness of this coating excludes the depth and richness of the genuine Gothic mouldings. The cathedral of Florence and its campanile are entirely covered with small panels of coloured marbles intermixed with bands of mosaic work, and reminding one of an elaborate Tunbridge work-box. In the interior of the cathedral of Pisa both piers and walls are constructed in alternate horizontal courses of black and white marble; the same fashion is followed in the front of the Genoese churches, and at Verona the courses are in red and white. A practice more destructive of architectural grandeur can scarcely be conceived; yet the Italians are so enamoured of it that in parts of their buildings where it has been omitted the black stripes have actually been supplied with paint upon whitewash.

William Kent.

The architect of the Horse Guards was one of the most versatile of English artists, and on that account he is often less valued than he deserved. If he came into the world in one of the Italian states instead of in Yorkshire, he would have obtained a name as a survival of the Renaissance spirit. He was born in 1684, and his association with the arts began as a coach painter's apprentice. Following a tendency that was natural with him, he taught himself portrait painting, and his first efforts were considered so remarkable that some gentlemen raised a contribution for the purpose of enabling him to go and study in Italy. Thither he accordingly proceeded in 1710, and remained there several years, till he had the good fortune to become acquainted with the Earl of Burlington in 1716. The noble patron not only brought home his *protégé*, and exerted all his influence and authority in matters of taste to recommend him to others, but took him under his own roof, where he remained till his death, April 12, 1748. How far Kent assisted his patron in his designs, or the latter assisted him, is doubtful; but it is certain that he soon discovered greater capacity for architecture than he had done for painting; and if it be true that the designs for Holkham, the seat of the Earl of Leicester, in Norfolk, emanated principally, if not entirely, from him, that single edifice alone proves him to have possessed very superior talent and taste as an architect, it being a *chef-d'œuvre* in plan, and possessing many graces and beauties of design. As architect and landscape-gardener he was in his proper sphere, and followed both pursuits with the true spirit of an artist. In landscape-gardening, in fact, he forms an epoch, and may justly be considered as the father of the English style of gardening; for, as Walpole, who has not been niggard of praise towards him, observes, he was "painter enough to taste the charms of landscape, bold and opinionative enough to dare and to dictate, and born with a genius to strike out a great system from the twilight of imperfect essays." Shakespeare's monument in Westminster Abbey will preserve his name as a sculptor, without at all adding to his reputation. It is therefore fortunate for it that it will bear such retrenchment without injury to its vital part. There is little doubt that in producing the statue Kent was largely assisted by Scheemakers.

NOTES AND COMMENTS.

BRICKMAKING is an indispensable trade, but there are some places where it seems to create more annoyance for people living in the neighbourhood of the works than elsewhere. A few years ago headaches and other signs of illness prevailed among members of the House of Commons, and the cause was traced to brick-burning at Shepherd's Bush. The metropolitan atmosphere is of such a compound nature, it is not unlikely that the fumes from the brickfields may produce effects which would be imperceptible in another district. The materials used for breeze in London are also of a kind to produce foul smells. The Public Health Act of 1891, if strictly enforced, will however make it difficult to carry on brickmaking within the metropolitan area. A decision which was given on Saturday in the West London Police Court is almost prohibitive of the trade. The Vestry had taken proceedings against three firms of brickmakers at Shepherd's Bush on the requisition of thirty-four of the inhabitants. It was alleged that the smells from the brickfields produced nausea and even blood-poisoning. Mr. CURTIS BENNETT, the magistrate, gave his decision that he must convict the defendants, as he came to the conclusion that the best practical means had not been employed to prevent the nuisance. Fines of 50*l.* and 25*l.* were inflicted, with 300 guineas costs. It was afterwards agreed that the summonses should be adjourned for a fortnight, for the defendants to consider whether they would give an undertaking not to burn bricks except with clean ashes and breeze. In that case the fines might be remitted. The decision must have an important effect on the building trade of London.

It was only under compulsion that the Royal Scottish Academy agreed to a reform, one of the effects being the election of several architects as associates. Little is gained by attaining full honours or minor honours in the Academy, for its affairs were so mismanaged during many years that identification with it is almost an acknowledgment of old fogeyism. The only use of the Academy is to serve as a survival, in order to demonstrate how many obstacles to the promotion of art can arise from a body of the kind. As long as the Academy possessed a monopoly of the representation of art, people were compelled to endure its defects. The creation of the Society of Scottish Artists enabled people in the North to realise that art could dispense with a fossilised institution. The discovery was gratifying and the new exhibitions became attractive. What was more remarkable, they did not entail a loss which was always inevitable with those of the Academicians. The members of the Academy are annoyed, and they show it in the peevish way which is to be expected with senile hearts. They propose to apply for an amended charter which will enable them "to make rules providing that any member of the Academy who, after the date of this supplementary charter, shall become a member of or exhibit with any other society of artists established in Edinburgh shall forfeit his membership of the Academy, and all the rights and privileges pertaining thereto, provided always that such rules shall not apply to members of the Academy elected prior to the date of this supplementary charter." Privilege is so often abused in the North it is not unlikely that some influential admirers of feudal and other ancient ways may prevail in obtaining a supplementary charter. But there is too much good sense among the people to allow of the approval of so unworthy a way of dealing with rivals. Meanwhile, can the members lately created, who are supposed to represent new ideas, allow themselves to be made the instruments of oppression without a remonstrance?

SOME commotion has been excited in the artistic circles of Berlin by the action of the Emperor in dealing with the prize list of the Artists' Society. This year the Council considered they were justified to put forward in connection with the exhibition the name of Herr PAUL WALLOT, the architect of the new Reichstagsgebäude or Parliament-house, for the large gold medal. In that way the services of an artist who had designed a most important work and spent ten years in carrying it out would be recognised, while painters and sculptors would be doing honour to an

art that is too generally ignored when medals are to be given away. The Emperor did not approve of the selection. Herr WALLOT's name was struck out and for it was substituted that of Frau VILMA PARLAGHY, the portraitist. The interference with the action of the Council was not approved, and endeavour has been made to excuse it on the ground that the architect was not the possessor of a small gold medal, and therefore was ineligible to receive the larger medal. There is no doubt, however, that Herr WALLOT has had to pay the usual penalty of all architects who are entrusted with important public buildings. Every member of the German legislature expected that his special requirements would have been attended to, and when it was found that Herr WALLOT was impartial there was grumbling. The Emperor was not sparing in his criticism of the new building, and he has now shown that he is not forgetful of shortcomings which he has discovered.

THE traffic in the streets of the Metropolis is so immense and growing, it is no wonder there is a difficulty in regulating the course of vehicles and foot passengers. The death of a physician in Cavendish Square, through collision with a cab with rubber tyres, has of course made doctors and surgeons more anxious about the dangers of the streets. Mr. BALMANNO SQUIRE maintains that the only remedy is a bridge over the roadway at places where this precaution is specially needed, and at other places a more general establishment of mid-road refuges. As to the bridges, he says, "It would be quite impossible that they should be mounted from the pavement. There is not sufficient space in any part of London for that purpose. The only way would be for the County Council to acquire a house on each side of the way and to utilise a comparatively narrow part of each of such houses for the construction of a staircase up as high as the level of the bridge, which need not be at a very high level. The bridge should be thrown from house to house over the roadway and over the two 'side-walks' or 'pavements,' and should have one pier in the centre of the roadway, or, if constructed on the 'girder' principle, need have no pier at all. A large portion of the population are slightly deaf; another large number wear spectacles or pince-nez, and a very considerable proportion are lacking in agility and coolness. Bicycles, hansoms with noiseless tyres, omnibuses, vans, light carts and 'four-wheelers,' all moving at very different rates of speed, have to be dodged, and a selection of the unfittest by a perfectly natural process is the inevitable result." Street bridges would have a most injurious effect upon the architecture; but, apart from that, we doubt whether people would care to make use of them. The Holborn Viaduct is an example. The staircases are an undoubted convenience, but they are not utilised to the extent that would be supposed, and the people who occasionally pass up and down are not of the nervous class.

WE hope the days of adulterated cement are numbered. A meeting of the cement manufacturers was held at the Cannon Street Hotel on Monday last, the 12th inst., when an anti-adulteration Association was formed. By one of the rules it was made a *sine qua non* that a statutory declaration on oath by the managing partner and resident manager of every firm desirous of joining the Association should be sent in. The form of declaration, which was signed at once by Messrs. KNIGHT, BEVAN & STURGE, the Wouldham Company, Messrs. F. C. BARRON & Co., and the Tower Portland Cement Company, Limited, is to the effect that the firm or company have not on any occasion during the last three years, or at any other time, brought to and added to the calcined product of the kiln, in passing through the crushers or mill-stones or grinding machinery or any other subsequent process, a separate supply of raw Kentish rag stone, other stone, furnace or oven ashes, disused or exhausted fire-bricks, or any other material, so that such added material would be ground, sifted or mixed together with the cement and form part of the cement powder, and sent out and sold the cement in this state. It became evident from what passed at the meeting that adulteration on a much larger scale than is supposed is practised at many factories, and one of the most important industries accordingly is seriously affected.

THE MARBLE ROOM, NO. 1 HOLLAND PARK ROAD, KENSINGTON.

PARLIAMENT HOUSE, EDINBURGH.

THE great hall shown in the illustration bore some analogy to Westminster Hall before the latter was compelled to be closely guarded to escape destruction. In a country where, as DANDIE DINMONT said, "a man's aye the better thought o' for having been before the Feifteen," the hall became one of the most prized places of assembly. Formerly, according to Sir WALTER SCOTT, it was "divided into two unequal portions by a partition, the inner side of which was consecrated to the use of the courts of justice and the gentlemen of the law, while the outer division was occupied by the stalls of stationers, toymen and the like, as in a modern bazaar."

In his "Memorials of Edinburgh in the Olden Time," Sir DANIEL WILSON gives the following information about the history of the hall:—

The Great Hall measures 122 feet long by 49 broad, and although the windows have been altered, its curious open-timbered oak roof remains, springing from a series of grotesquely sculptured corbels. Long after it had been forsaken by the Scottish Estates it retained the high throne at its southern end, where the sovereign or his commissioner was wont to preside over their deliberations, and on either side a range of benches for the nobles and barons, with lower ones in the centre for the commissioner of burghs, the Scottish Estates having formed to the last only one deliberative assembly. Without this area a pulpit was erected for sermons to the Parliament, the same, we believe, that is now preserved in the Museum of the Society of Antiquaries under the name of "John Knox's pulpit." Along the walls there hung a series of portraits of sovereigns and eminent statesmen, some of them the work of Sir Godfrey Kneller, but these were among the first of its decorations that disappeared, having, it is said, been bestowed by Queen Anne on her secretary, the Earl of Mar. Others, however, of those paintings adorned the walls within the recollection of our older citizens and are now, we believe, at Holyrood House. Portions also of early decorations, including fragments of ancient tapestry, the hangings in all probability that were put up during the Protectorate, were only removed towards the close of last century. Nicoll tells us, "The Preses and the remanent members of the great counsall did caus alter much o' the Parliament Hous, and did caus hing the Over hous with riche hingeris in September 1655, and removit these rounes thairintill appoyntit for passing of the billis and signeting of letters. So wes also the Lower Hous diligitlie hung." Nor should we omit to mention The Creed and Ten Commandments, once so appropriately suspended on the walls and mentioned in a MS. volume of last century as "taken down when the Court was repaired." Those decorations have been replaced by statues of Duncan Forbes of Culloden, Lord President Blair, son of the poet Lord Melville, Lord Chief Baron Dundas, Lord Jeffrey and Lord Cockburn. But superior as those sculptured marbles undoubtedly are as works of art to the paintings and tapestry they replaced, the cold beauty of the marble—even though wrought by the chisels of Roubiliac, Chantrey, Brodie and Steell—very imperfectly supplied the place of the luscious colouring of Kneller, or even the faded antique needlework which helped to harmonise the walls with the grotesque yet rich effect of the old oak roof. But happily since then the portraits of royalty have been not inaptly replaced by those eminent judges and members of the Bar.

To a stranger visiting the Scottish capital few of its public buildings are calculated to excite a more lively interest than the scene of its latest legislative assemblies, for while this shares with the deserted palace and the degraded mansions of the Old Town many grand and stirring associations, it still forms the hall of the College of Justice founded by James V., at once the arena of the leading Scottish nobles and statesmen of the last two centuries, and the scene of action of many of the most eminent men of a later day. Beneath the old roof thus consecrated by historic memories the first great movements of the Civil War took place, and the successive steps in that eventful crisis were debated with a zeal commensurate with the important results involved, and with no less fiery ardour than that which characterised the bloody struggles they heralded. Here Montrose united with Rothes, Lindsay, Loudon and others of the covenanting leaders in maturing the bold measures that formed the basis of our national liberties, and within the same hall only a few years later he sat with the calmness of despair to receive from the lips of his old compatriot, Loudon, the barbarous sentence which was executed with such savage rigour.

Mr. E. Macbeth, A.R.A., has been elected a corresponding member in the section of engraving of the French Academy of Fine Arts, in succession to M. Dangarin. M. Pradilla, of Madrid, has succeeded M. F. Madrazzo as foreign Associate.

THE ARCHITECTURAL ASSOCIATION.

THE ordinary meeting of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair.

Mr. F. GOLDSMITH, hon. secretary, read the following report of the general committee on the resolution of January 19, 1894, on the education of workmen, which was duly adopted:—The Association on January 19 last referred it to its committee to inquire and report if, and in what manner, the Architectural Association can usefully exert its influence towards the organisation of a more thorough system of education than at present exists for artisans engaged in the London building trades, and its further supervision by architects.

We have carefully considered this reference and have caused numerous inquiries to be made. We are satisfied that there are many questions connected with the education of artisans in the London building trades which are of very considerable importance to the future well-being of architecture and which are needing careful examination. The best course seems to us to be for the Association to invite a conference to meet at an early date to discuss these questions. We have consulted the following bodies, and have been informed that they will gladly appoint representatives to attend the conference:—Architects—The Royal Institute of British Architects, the Architectural Association, the Art-Workers' Guild, Independent London Architects. Master builders—The Institute of Builders, the Master Builders' Association. Workmen—The Building Trades Federation, the Operative Bricklayers' Society, the Amalgamated Society of Carpenters and Joiners, the National Association of Operative Plasterers, the United Operative Plumbers' Association, the Operative Stonemasons' Society. City companies—The Carpenters' Company, the Plumbers' Company, the Bricklayers' Company. Educational bodies—The Technical Education Board, the London School Board. Polytechnics—City and Guilds' Technical Institute, Regent Street Polytechnic, Battersea Polytechnic, Borough Polytechnic, Goldsmiths' Institute, New Cross, and People's Palace, Mile End. We recommend:—"That we be authorised to invite a conference of representative bodies to meet at an early date to discuss the education of artisans engaged in the London building trades, and to take such other steps as we consider desirable in the matter."

E. W. MOUNTFORD,
President, Architectural Association.
F. T. GOLDSMITH, } Hon. Secs.
B. F. FLETCHER, }

The Study of Modern Architecture.

Mr. PITE said:—It is not much good mourning over the times we live in—that we have to deal for the most part with unartistic and parsimonious clients, that we have no native art traditions or instincts to assist us in the craftsmen whom we employ, that where architectural ability exists it is no recommendation or guarantee of professional success to its possessor, and that commissions are obtained by much the same connections as more ordinary business, the family friends or social qualities of the young architect being more certain sources of prosperity than ability or even genius in his art, or that competitions are generally an effective premium upon subservience to vulgar (not using the word offensively) ideals. We, indeed, as architects reading the glorious past of empires and nations in their architecture might well weep aloud for the blindness and ignorance of the rest of our race were public weeping of any avail.

And as young architects, having much of the frank discrimination of childhood still left to us, might we not lament that many, very many, perhaps the great majority of our professional elder and younger brethren, are sadly deficient in true architectural perception or power, and that the sum of all our labours is a national architecture which, in comparison only with contemporaneous work abroad, is quite unworthy of our idea of Great Britain's international position? And leaving out our elders from the purview, can we be at all happy about ourselves; is the "Architectural" element of our present "Association" worthy of its name? Does not the suggestion of a critical review of the aggregate architecture evolved by its members chill us with searchings of conscience that our self-satisfaction would be unable to survive? But all this mourning and pessimism is not very much to our present purpose. Let us at the outset assume all that it can do for us by accepting the conviction that there is much scope for improving by what means we can our modern architecture, and taking the common "A. A. man" as we find him, and the ordinary circumstances of present-day practice, let us consider what the study of latter-day architecture can do for our present discontent.

Mr. Fergusson comes to this conclusion in his "History of Modern Architecture," without unhappily helping us forward.

"On reviewing the history of architecture during the past three or four centuries, the retrospect, it must be confessed, is sufficiently melancholy and discouraging. For the first time in history the most civilised nations of the world have agreed to forsake the only path that could lead to progress or perfection in the 'master art,' and have been wandering after shadows that constantly elude their grasp. When we consider the extent to which building operations have been carried during that period, the amount of wealth lavished on architectural decoration, and the amount of skill and knowledge available for its direction, it is very sad to think that all should have been comparatively wasted in consequence of the system upon which these have been employed. Few will dispute the assertion that there is no Renaissance example equal as a work of art to any Gothic or Saracenic building, or that ever attained to the picturesque appropriateness of these styles. Nor has any modern design ever reached the intellectual elegance of the Greek or Roman, or the sublimity of the Egyptian; and all this simply because of the mistaken idea that success could be achieved without thought, and that the past could be reproduced in the present."

But Mr. Eastlake is more hopeful, and cheerily points out a road to an architectural paradise which, unhappily, but a few short years have sufficed to make us forget. The conclusion of his "History of the Gothic Revival" is as follows:—"Architects must learn to sacrifice something of their antiquarian tendencies; the public must learn to sacrifice something of their conventional taste. By dint of earnest study and endless experiments, by help of theory and precept, by means of comparison and criticism, the grammar of an ancient art has been mastered. Shall we ever be able to pronounce its language—not in the measured accents of a scholastic exercise, but fluently and familiarly as our mother tongue? Will a time ever arrive when, freed from the idle prejudices, the pedantry, the false sentiment and the vulgarisms which have hampered its utterance and confounded its phraseology, this noble and expressive language shall be used throughout the land, retaining here and there provincial idioms—rising to eloquence in our towns and majestic emphasis in our public buildings, telling of rural beauty in the village homestead and exciting to devotion in every church, proclaiming comfort in every home and stability in every warehouse? Then, and not till then, shall we possess—if it be worth possessing—a really national architecture. Then, and not till then, will the Gothic revival be complete."

The study of architecture hitherto has consisted of the review of the works of antiquity, all the resources of which have been laid under contribution to our knowledge of what we have mistakenly called the "styles." Travel and research during the past hundred years have made this possible, and, attracted in the first place by beauty of form and detail, then by the interest of history and developments, architectural students have glowed with enthusiasm over Greek, Egyptian, Roman and almost every "style" as it became available for observation. A somewhat wider range of view more recently has led to a consideration of the methods and motives of ancient design and construction, and enthusiasm has grown into wonder as the science displayed by Greeks or Goths has been discovered where little else than native genius was suspected to have been at work. The æsthetic and accidental charms of all the "styles" have not been wasted upon desert air, as sketch-books and photographs have noted and secured their effects for further publication or use. None of this enthusiastic study has really been wasted; its fuel has obtained for us a warmth and touch of imaginative colour that has been invaluable to all our conceptions of the past in art and literature, and has been especially manifest in the work of the historians, with which our own generation has been so richly endowed; but as the architectural student in becoming a practising architect has been overmastered by his love of the forms and principles of "the antiquary times," the result upon our current modern architecture has been the occasion and cause of our melancholy and discontent.

It will be a hopeless and thankless task to set before architectural students the foolishness of this enthusiasm, and the unwisdom of a thorough concentration of energy upon the mastery of the secrets of the success of ancient work. Without this kindling of interest and awakening to the artistic life of architecture we shall be worse than mere pedants, and be mere measurers of buildings, construction tailors, drudges of mechanics and soulless men of business. Enthusiasm and a lofty ideal of beauty are all and everything to true architectural success, and at all costs the flame must be kept burning, and speaking to students the pre-eminent need of a devouring zeal for their art must be insisted upon. If you have not yet experienced the unmistakable joy of discovering a deep pleasure and delight in the attainment of an architectural design, a pleasure that lights up all the study that otherwise might appear dry and uninteresting, that creates a living interest in fine buildings leading cheerfully to laborious measurement and study, and to be very practical indeed, if all your spare time is not claimed after other pre-eminent

duties and calls to its pursuit—an old-fashioned but well-chosen word—by almost irresistible impulse, you may well have serious misgivings as to your future in a profession which is full of most anxious responsibilities, which has an unusual proportion of disappointments and difficulties, and which is by no means remunerated in proportion to the care and study required to attain success in each single exercise of the architect's duties. It is a matter of deep conviction that a young architect's path, except in very rare and fortuitous instances, is one that above all requires the stimulation of a genuine and spontaneous enthusiasm for his art.

Our position is therefore, that the marvellous enthusiasm for varied phases of the architecture of antiquity to which this century has been witness cannot be any longer beneficial to the modern architect, and further, that without some equally potent force as living and instinct as the ardour of the past, the modern architect, and with him modern architecture, is in a pitiable condition.

We are not altogether without sources of information as to effect upon architectural art of different conditions than those which have operated upon ourselves. In spite of our native phlegmatic tendencies our more volatile continental neighbours have been no competitors with us in the race for novel fashions and styles. The mysterious rabies of our Gothic enthusiasts has scarcely infected the warmer blood of the French and other nations of southern Europe, and we can discover in their architecture little or none of the frenzy of our own.

In company with Belgium, Austria, Italy and Germany, France has pursued a regular academical development of the traditional architecture of the immediate past, and with patient studiosness the "European style" of the nineteenth century has been developed. No warmth of feeling has evolved in its generation, and while claiming respect for all the qualities of appropriate and characteristic civility, we fear that until the loving and progressing hands of Time with her handmaid History intervene, no warmth of enthusiasm can be excited within us towards the continental architecture of our own times.

We cannot stay to discuss fully now the causes of the want of freedom and adaptability, the liberty and fraternity of design that seem the inevitable result of the academical system of complete architectural training as adopted abroad. It must be sufficient to say that mere enthusiasm for training or study and education cannot of itself supply the needed fire, and that we must not mistake professional equipment and qualification for architectural efficiency and power. There is some considerable danger of this at present among ourselves, as we are all conscious of the slackening interest in old work and its study, as the failure of competitions for medals and prizes offered for measured drawings testifies, and it is to be feared that the progressing pressure of examinations is already impinging upon the tender growth of that enthusiasm which architectural educators seem strangely incapable of assisting. Until we get a new enthusiasm, let us take care not to strangle the old one. Enthusiasm may be foolish, but she is a goose that has laid golden architectural eggs.

Our position, however, will soon become ridiculous. We are waiting for an afflatus—for some now unknown, but ardently-desired guide—some cherub or "mahatma" to hoax us into vigour and reveal the new laws of the unseen beautiful of Goethe. Where is the romancer to conjure us, as Walter Scott did our grandfathers, into the Gothic revival and the Houses of Parliament into existence; or the philosopher who, as Ruskin, can make us, like our fathers, weep with joy over the stones of Venice and conjure the Oxford Museum and the Law Courts into being; or an architect even like the cunning charmer who has led all his followers into the softly-fatal toils of that Circe of architecture Queen Anne, and has left them there transmogrified into lower beings? The strings of our artistic being wait for some Æolian breeze from Parnassus to awake fresh chords and harmonies, and, while we wait and sigh, the examination and qualification screw is being applied and the soft impressionable artist is being strung up into an instrument that must be struck artificially and smartly before any sound can be obtained from him—the piano-organ of the streets, in fact, being only an Æolian harp progressively strung up and tuned to qualifying pitch, assisted by applied mechanics in the production of music, so as to be independent of the gentle zephyrs of heaven.

Speculation as to the future is almost as unprofitable as lament over the past, but the suggestiveness of the idea that architectural students two centuries hence will be like ourselves, enthusiasts as to the works of their own ancestors, may have something to teach us. Why not apply our own treatment of the past to our present? Why not be as enthusiastic about the work of the nineteenth as about that of the seventeenth century? Why not sketch it, study it, measure it? It may be every bit as good and much better, as Queen Victoria is than Queen Anne, or even Queen Elizabeth. All that goes for the making of good architecture has been much more

abundant in our era than in the past, and, perhaps, if we gave up looking at distant objects with telescopes and looked naturally at what is around us we should find as much to interest and delight our eyes. Surely the historian will feel an enthusiasm for the nineteenth century that will be shared alike by the man of science and the artist and man of letters. Why should the architect stand aside and be unmoved? Is he not already qualified by his recent revival of the whole gamut of the styles from Egyptian down to the Batty Langleys of the eighteenth century, to proceed into the nineteenth and study modern architecture with some of the enthusiasm that he has lavished upon the others at such expense of reputation to himself? There are marvels enough of construction, economical as well as extravagant, of applied science, differing from that of Greek temple or Gothic cathedral, but definitely architectural in the equipment of our buildings and their adaptation either for machinery, public uses, or domestic comfort. And within the limits of a century have we not erected a series of buildings the æsthetic qualities of which are varied and beautiful in a very high degree and more so than those achieved by any other race, the wide world over, in a similar span of years? In construction, in scientific equipment and in æsthetics, surely the architecture of the nineteenth century will be as worthy of enthusiastic admiration, we do not say imitation, as any of its predecessors that now excite our envy. The inbred and underlying general maxim of our education, that ancient work is good and worthy of study and modern bad and unworthy, is illogical and untrue, and without attempting to invert it and prove the opposite we may safely admit modern architecture to the students' course and commend it to his heart, without offering the smallest slight to his ancient ideals, or destroying the value of a single result obtained from his enthusiastic devotion to the past. Study and enjoy ancient art as much as ever will be the best advice to give, but also study modern and enjoy modern architecture, if only for its modernness, and derive your enthusiasm from the wonderfulness of modern life and invention and display your delight in it in your architecture by your frank acceptance of the present, by your heartiest endeavours to make the best use of the materials, inventions and science of the time, and let your trained and instinctive sense of beauty express in proportions, composition, features and decorations that you are not guided by a blind subservience to archaeological ideals, but rejoice in living in an age of privilege and advantage, with all the knowledge of the past ready to your hand and the products of commerce and science at your disposal.

It was the use of advantages and qualities such as these that made all characteristic architecture in the past, and that cannot fail to do the same for us and you, and a little patience and common sense will soon reveal to us, and to the world at large, perhaps to them before to us, that an enthusiasm for modernness in architecture results in more direct and simple beauty than some of us expect.

From day to day, in ordinary practice, we are, of course, face to face with all the essentials of modern architecture, in whatever branch and for whatever purpose we have to design, and putting aside the uncomfortable yoke of archaeological style will be no difficulty in itself—greater freedom for imagination will be the result, and the resources of all beautiful buildings are at our disposal for material as before, and a free hand for their artistic and eclectic use, when we perceive that we can use them to realise our ideal of what architecture should do for our time and age. Nothing can be evolved out of nothing, and we are far from suggesting that the architect should lay all his present materials of design aside and figuratively make bricks without straw. All this material, however, does not lay, as the Royal Institute of British Architects' examination scheme in its art section syllabus seems to imply, in a knowledge of the forms and features of ancient architecture. The beauty of ancient buildings cannot be transferred by imitation to modern ones, for you may measure and photograph and reproduce in actual building, and find that you only have a stupid copy without life or interest.

As this has been a century of revivals, examination of some of its typical buildings cannot but be instructive. Try to discriminate between the beauty that is merely borrowed from antiquity and the living elements of architectural art that compose it. Ascertain how much is interesting and attractive merely because it is reminiscent to the student of bygone art, and how much is beautiful because it is expressive of the architect's delight in his problem and its elucidation, and manifests his appreciation of justice in proportion of ornamentation and form. Analytical study of this kind is essential to a proper grasp of the architecture of any period, though the dry-as-dust pundits of the day are not awake to it. It is indeed a wonderful education in itself to behold a great building as the Parthenon, simple in all its parts and clearly readable in its plain construction, to recognise an awful grace and a fascinating dignity in its picturesque grandeur, and cherishing the fact of its unmistakable beauty seek to ascertain the anatomy of its expression. It is, indeed, not a fruitless task for a modern

architect; the secret of its beauty is not only in the subtle mathematical ratios that underlie its design, not in the forms of its detail and not only in the unrivalled dignity of its Acropolis site. Surely it is not in its antiquity, for it must have been more truly and perfectly beautiful when it was first revealed as a work of the most modern architecture of its glorious era than even now in its picturesque and suggestive but sad ruin.

Its charm is independent of archaeological descent or antique traditions, and lies in a manifested power to support and carry, to shelter and shade, and to endure with firmness. The mind without effort is assured that the first necessities of all building are satisfied. The simplicity of the expression of these great facts is its first claim upon the mind, just as is the sense of the immovable, and, so far as time is concerned, eternal solidity and vastness of the Great Pyramid. But this serene majesty of conscious power is secured and expressed with every evidence of perfect finish and completeness; the same strength of support might have been barbaric and over strong, the sense of shelter might have amounted to gloom, and the sense of firmness and footing might have been inelastic and dead, but everything has been accomplished with art as well as with power; the columns are perfectly shaped for their load, and are decorated to emphasise the direction of their expression; they are shaped to completely satisfy the eye as to stability, and their abaci crown them only to receive their load aright. Their bulk is regulated by the superincumbent load, weighed with regard to the possible length of connecting beam, and adjusted to satisfy the eye as to the due proportion of void and solid. The ample entablature is the essential element of the design, affording shelter and binding with simple horizontal masses and lines the supporting columns into covered and shady colonnades, and in carrying the roof makes it a building. The entablature is emphasised and decorated, as a rest, with sufficient beautiful forms in the metopes, the undecorated triglyphs with their vertical flutings sufficing to convey the expression of the downward bearing of the roof upon the columns. The cella walls are equally expressive of the required enclosure, without unnecessary architecture, yet magnificently decorated with the unbroken line of frieze, still remaining in part in the western walls. In all, the simplest lines and the most direct expression governing the whole, permitting in the decoration the required element of freedom and play of lines to afford balance and contrast to the eye.

Every one of these elements and methods can be transmitted into modern architecture, and all the architectural materials of the design be handled and disposed by the skill and judgment of the architect rather than the mere reiteration of its forms and details. It is, however, indeed singular that you may have a reproduction not only of the forms and details, but of the exact proportions and size of the original, and miss its mysterious and complete beauty. The Walhalla near Ratisbon, built by Klenze as a Bavarian temple of fame, is a complete archaeological effort to reproduce the Parthenon. The building occupies a fine site on the slope of the hills that border the Danube, that would lend itself to any really fine building if suitably designed. No expense has been spared upon it or its sculptures, but apart from the inevitable differences of material and site the whole is uninteresting except as a failure, and miserably unimpressive as architecture. Looking upon the Parthenon, some years later it is true, not a thought or recollection of the vaunted Walhalla crossed my mind, and were it not a fact that the latter is an express reproduction of the other, even as to size, nothing would connect the modern commonplace with its real original in any way. It must be something more than even ignorance of the curvature of the horizontal lines that makes the difference. And Klenze could do very satisfactory modern work himself when less trammelled with archaeology, as witness the new Pinacothèque at Munich, which is a really fine and simple Classic building, admirably adapted for and expressive of its purpose as a picture-gallery and distinctively modern and reasonable.

The application of an analytical examination to a modern building of the revived Greek "style" will be equally valuable to the student. Admit as an archaeologist the interest and charm of reviving pure Greek mouldings, features and proportions; but having admitted so much, carefully strip the modern edifice of all this adventitious unarchitectural quality and see then what of permanent and modern architectural value remains. This does not mean that you are to regard the building as a carcase without the forms and details requisite to its beauty, but as having each of them, on account of their express suitability and appropriateness to the purpose in hand, not merely as necessary adjuncts to the design, because it is pseudo-Greek in style, and are demanded by antiquarian rather than architectural instinct. But this analysis of the archaeological motive in design ought to go deeper still into the principles that regulate a use of features, and should decline to admit the use of the order or pediment decoratively, apart from the interpretation of the natural constructive elements of the building. A concrete case, in such a work as St. Pancras Church in the Euston Road, which we all know, will illustrate

the process and enable us to ascertain how much of it is ancient and how much modern architecture, and how far the ancient principles of design have been preserved in the re-use of its elements.

This particular example is the more interesting as it was erected by Inwood, who, after its completion, designed the neighbouring church of St. Mary's, in Seymour Street, Somers Town, in the Gothic "taste." In the design of the latter church archaeological zeal and accuracy play no part and exercise no charm, as Inwood was in darkness as to the new light that was about to dawn from the lamps of Mediæval art, and having but the barest acquaintance with its forms and details, he had to fall back upon his perception of the ordinary and common properties of all architecture. This work, therefore, unfortunately proved to be lacking in any pleasing quality whatever, its proportions being ugly and the whole thoroughly uninteresting internally and externally, in arrangement and impression, and the greatest charity could only regret its removal or its "restoration," as destroying an instance of the real poverty and barrenness of the field of modern architecture early in the nineteenth century, apart from an enriching fertiliser compounded of the dry bones of defunct ages. St. Pancras is, on the other hand, a building that suggests in every form and detail enthusiastic archaeological study. I well remember being taken to the church, as an unsophisticated child, and wondering why the sides of the windows, instead of being upright, inclined towards each other at the top and widened outwards below, and the somewhat later discovery in a picture-book of Egyptian doorways that did the same, and the appreciation that ensued of the architect's motive, which I may have supposed had been to make a church as much as possible harmonise with the pictures in the Scripture history-books of the period. Another early impression, however, was of the very solemn and awful effect of the row of heathen goddesses that kept watch on either side of the church over the large tea-caddies outside the vestries. Parenthetically, too, of the curious ecclesiastical position of the preacher, standing within a wondrous pulpit, made out of the Royal Oak in which King Charles II. had been ensconced, though not for the purpose of preaching. The antiquarian thoroughness of the design is, in its way, most remarkable, and is, perhaps, of a sounder type than that of Klenze's Walhalla. The prototype or fountain is in the Temple of Minerva Polias, which forms part of the Erechtheum on the Acropolis at Athens, the lovely eastern portico of which supplied the order of St. Pancras—how different the result can scarcely be described. The original seems to be a very offering to the Graces of architecture; a refined and delicate elegance of proportion, a sense of style in its true meaning, of virile beauty and quiet power characterises it, which loses nothing by its position upon the platform of the Parthenon, in mathematical comparison with which it is almost diminutive in scale, though in interest and varied charm holding its own completely. The portico of St. Pancras is just double the size of that of the Temple of Minerva Polias, and though the utmost care has been bestowed upon the detail of the order, the real appreciation of the subtle grace of the original being lacking, its charm has not been grasped. There is (sadly enough for our consciences, if profitably for our present purpose) one of the columns from the eastern portico of the Erechtheum in the British Museum, and even as a limb torn apart from its body it is a wonderfully beautiful object, which each of you should take an opportunity of examining, and one day on your way to the "artists'" shooting-gallery behind St. Pancras Church of comparing its effect with that of one of its overgrown imitations. The portico and order of St. Pancras, however, fails for other reasons than want of charm in proportion. There is no simple and easily-perceived motive prompting its existence or design. The hard and unpleasant truth will out that it is but a sort of antependium to the steeple composition, with which it is connected by an attic which acts as pseudo-peribolus to the octagon temples above, and which disconnects the roof of the church most effectively from the pediment of the portico.

The design of the steeple may roughly be described as two choragic monuments placed upon each other, surmounted by a tower of the winds and crowned by a large acroterium and a Latin cross, with the exception of this last item all the detail being Athenian, though the composition is borrowed from Sir Christopher Wren. Setting aside antiquarian considerations, the interest vanishes, though the subtle conceit of applying a choragic monument for the accommodation and celebration of campanological music and a tower of the winds as the site for a weathercock might be cherished as sufficiently sentimental to be respected, though by the way the appropriateness that might have been gained by affixing the clock face to the horologium or tower of the winds has not been taken advantage of, the clock having been wisely brought lower down the steeple into view.

Apart from being nakedly uninteresting, the proportions of the composition of the western front are satisfactory, and will preserve for the building and its architect more esteem than

the effort to be Greek. The eastern end of the church is necessarily more original and consequently satisfactory, the apse and transept-like vestries having some scale, grouping and expression of their own. The infatuated architect—is the description too strong?—however, with infinite pains and much expense has conceived and executed the wonderful caryatid adjuncts, with cecropian sarcophagi, one supposes for the purpose of typifying that, modern Acts of Parliament to the contrary, the enclosure around the new St. Pancras Church was meant to be a graveyard. All this we admit to be sheer excess of antiquarian zeal, wasted upon architecture and unworthy of the good sense of our time. Not that architectural poetic effort is senseless, but that the reproduction of antiquarian beauties for this purpose is not architecture at all. The wondrous beauty of the single caryatid portico of the Erechtheum, however, can only be travestied and wasted upon London. Its effect and freshness belong to the living and permanent efforts of architecture. The south elevation of the Erechtheum, which looks upon the north side of the Parthenon, presents no other features than these majestic sisters, sculptured in dignified awe of the building they front. With masterly consideration and self-respect the architect presents no peristyle or portico to flank the Parthenon, though every other front of his building is so treated, the strikingly original and unique composition that he designed preserved the dignity of the Erechtheum in according its homage to the Parthenon. Of the figures we do not dare to speak. They are, perhaps, the most striking combination of the finest architecture and supremest sculpture that the world possesses. They cannot be claimed separately by either art; they are at once architecture and sculpture, differing in their essential combination from the partnership of service that each of the sister arts agreed to render in perfecting the Parthenon. Sir Frederic Leighton has paid an eloquent and discriminating tribute to the sculpture of the caryatides in one of his addresses, remarking on the subtle variations of line in the different figures. Five of the six sisters are *in situ*, the sixth is in the British Museum, miserably divorced from domestic happiness in a chilly and unhappy exile, losing instead of gaining by its solitariness. A reproduction cast in cement most ineffectively takes its place on the Acropolis, and as a good cast would be satisfactory enough for purposes of study at home, it does seem desirable that the integrity of the Cecropium of the Erechtheum should be, by an act of our Government, satisfactorily restored by the replacing of the original where it will be of immense value to the wonderful building of which it is an integral part. I am indebted for this suggestion to a conversation with Mr. Arthur Cates, whose friendship with Dr. Schliemann and knowledge of Athens qualify him to speak, and as questions which would arise and difficulties which would lie in the path of the return of the Elgin marbles to the Acropolis would not arise in this case, and as the result must give much gratification to the whole world of art and letters, it is to be hoped that steps may be taken to give effect to the suggested restoration of this exiled caryatid figure.

The present Prime Minister, being a member of the Society of Dilettanti, we can certainly invite the Institute of Architects, with their great Athenian president, to seize their opportunity. The caryatides of St. Pancras are of clay and iron mixed. The interior, however, being less trammelled, is more satisfactory, and indeed its large and spacious effect of a fine hall with an impressive apse is to be preferred as more suitably modern than many Gothic interiors, having dividing arcades and walls with narrow and unscientific ceilings and roofs.

There are lessons enough for an observant student as to the permanent and effective qualities of modern architecture, even after skinning off all that the architect himself would have called the architecture of such a building as St. Pancras Church. What is true of works of the Greek revival is equally so of the Gothic, though the degree of interest may vary, and as the sources lie ready to the hand of the architect, as well to the eye of the world at large, it is more difficult perhaps to separate the elements of design. But the test may be applied in the crudest way to the most recent and perfect examples of modern ecclesiastical architecture. Deprive a modern thorough Perpendicular church of its archaeological robe, and of its studied interest in correctness of style and purity of period, and what is there left to indicate that the world has moved on since its primal age of Mediæval beauty and innocence, and that we are in the age of England's greatest prosperity and glory? What is left indeed to indicate any life or movement, or that it was built in the nineteenth instead of in the fifteenth century, except, perhaps, the existence in the building of a heating apparatus, a gas supply and some limited sanitary arrangements? Consummate archaeological and artistic skill are required to accomplish such a result as against natural tendencies and laws. And in our time such efforts have fairly maintained the unreasonable conflict with modern progress, but to no good effect, for when the disintegrating intellect of time pronounces verdict upon such works, it will be without

recollection of the fiery enthusiasm for Mediæval antiquity that produced and governed them, and they as buildings of modern times will be judged by the light of the nineteenth century.

There are a large number of buildings, however, of the Gothic revival that have qualities well calculated to survive the ebbing of the tide of Mediævalism—buildings the interest and charm of which rest upon surer artistic grounds than are common to all the ages.

We are gradually drifting away with the tide from sympathy with the feeling which prescribed a peculiarly national style, such as Elizabethan or Perpendicular, for the Houses of Parliament, while Pugin's accuracy of feeling for Gothic detail is perhaps somewhat palling upon our jaded and corrupted palates. But there remains in the group of buildings by the riverside at Westminster a beauty that is more lasting than a passing taste, and reveals the fact that the greater architectural qualities of majestic symmetry and grandeur of grouping are permanent and essential to success. A celebrated Munich artist, Mr. Rosenthal, who had rather derided English architects as "Gothic eaters," said to me that of all the buildings he had seen in England this was the most lovely, and he was in little doubt as to its being the most charming group in Europe. The effect from the river or from either Embankment is one of graceful ease and restful picturesqueness, illustrating the overlooked truth that a proper appreciation of symmetry in architecture produces picturesqueness in a natural and unforced manner that is much more satisfactory than the artificial grouping that only looks well from a fixed point. The interest of the whole building is sustained by its parts in spite of its detail. The variety of design in the general forms of the towers and pavilions is pleasing, though the forms themselves are doubtless open to proper criticism from trained Mediævalists, and this variety is wisely used in a building of so regular a plan. The Mediævalism indeed is only skin-deep, the corpus of the whole being of sound architecture, so that our friendly and useful fogs and river mists assisting in the obliteration of its archaeological epidermis, we are enabled to admire in it a fine work of modern architecture.

The Law Courts will come rather differently out of the test, as the marvellous Gothic life which invests its every detail and feature may be chiselled away and the building will still be rampantly Gothic. Reclothe it with Classic or Renaissance detail, and the vigour will still be powerful enough to assert its vitality and claim the building, so long as it has any articulation left, as the *ne plus ultra* of the Gothic revival. The design flings aside almost contemptuously the common properties of the modern architect, claims to be independent of symmetry or repetition, no mere grandeur being aimed at, and repose being despised. Relying on the apparently mistaken supposition that a complete Gothic building must be as broken up in outline as one that is a growth of generations, and upon originality in the design of features and detail alone, success is sought. The wonder is that the building is even as successful, as we must confess that it is, in arousing wonder for the extraordinary capacity of the designer, who almost superhumanly set aside all laws of composition and balance, and fought against the very elements that would have assisted him to an easier success. The building as a whole gives little or no pleasure to anyone who cannot appreciate its motive power of Procrustean Mediævalism, that insists on forcing everything into its ideal mould.

Pull it down; break up its arcades and columns, its pinnacles and staircases and scatter it far and wide, for there is enough of it to give a large store of masonry to the museums of every civilised nation of the globe, and you will doubtless find that the fragments of archivolts and strings and plinths, of corbels, caps and bases, of all the multitudinous variety of interesting detail, will then begin to arouse genuine enthusiasm for their wonderful beauty, originality and vigour, and that the fame of the designer will become a world-wide reputation as a master indeed of all the arts of design. But—and it is a significant "but"—who of us would have much doubt if the most ingenious restorer, whether of Mediæval or prehistoric antiquities, would ever be able, even with all the fragments before him, to reconstruct a reasonable and rational pile of nineteenth-century architecture out of them?

We have buildings, however, enough, of a much more typical class and likely to be much more useful to us in our own careers, in which the really modern elements of fine architecture stand clearly out. Do not fear to be modern. Study and sketch every example that faces a modern requirement and subdues it artistically and renders it beautiful without sacrificing aught upon the shrine of antiquity. A warehouse front, even if stipulated to be wholly of windows with only iron-girder construction besides and a few brick panels, can and should be made as beautiful and interesting a work as a half-timbered front, of which there are many examples, with its continuous and unbroken ranges of windows. And have we not for such classes of buildings resources in new materials that sensibly used would soon be recognised as artistic, such

as glazed brickwork and terra-cotta, only when not used and designed as stonework? Why should concrete and cement building be left to the tender mercies of cheap speculative builders, when we have plenty of need to be taught the value of broad unbroken surfaces in design and long for economical methods for smaller country buildings, where the use of different textures in the finishings of a cemented or concrete wall will give plenty of variety and scope in new directions?

Above all, learn to discriminate, practise upon yourself, examine and try to note down the impressions made upon you by a building, say, of known beauty, and then of one that you see for the first time. Why do you like one? Why are you doubtful about another? Not what features please you merely, but what qualities create the pleasant impression. Train yourself to like and dislike reasonably on good grounds, instead of unreasonably like the amateurish and ignorant world.

The reason why I cannot tell,
But I do not like thee, Dr. Fell,

may do for an excuse for any amount of ignorance in anyone whose business and profession it is to discriminate between good and evil in design, and to bend the whole of his efforts and to marshal all the factors of each building of his hand into harmonious and therefore reasonable beauty.

A hearty vote of thanks was passed to Mr. Pite for his paper.

ARTISTS AND THE PUBLIC.

THE following address was delivered by Mr. Hall Caine at the dinner which was held in Edinburgh to celebrate the opening of the Scottish Arts Club:—

I understand that the great change that the Scottish Arts Club has lately undergone is that of extending its membership by the admission of lay members. This is, I think, a change entirely for the better. Besides the material advantages which a larger membership will secure for the good of all, there is an artistic advantage which artists of all classes may be expected to reap from this effort towards breaking down the barrier which always tries to stand between the man of art and the man of the world. That unnatural barrier shall be my text in the short speech which you have given me the honour to address to you to-night. I have lived much among artists all my life, and one thing I have observed above others is this—that the besetting danger of the artist is the tendency to cut himself off from the work-a-day world, to regard himself as belonging to another race, to draw further and further apart the art world and the world of ordinary life, to keep the general public at arm's length—in a word, to become narrow and self-centred. I know there are always two schools of artists, two creeds of art in this matter. George Sand has cleverly described them. The one disdains the public, thinks meanly of the public intelligence, and regards as vulgar and inartistic all art that is specially designed to meet the slow and dull intelligence of the masses. The other school thinks that artists ought to make themselves intelligible to all, this is what art was meant for, and without it art robs itself of its highest conquest—the power of putting itself into communication with men's hearts and consciences. Well, if I may say so at this festive board, my experience of some artists is, that though they object to being mistaken for preachers, they can be as self-centred as some preachers themselves. When I've heard a certain painter, as famous for his "gentle art of making enemies" as for his pictures, great as they are, inveigh against the art ignorance of the masses, I have been reminded of the German divine who was so proud of his own doctrine that he would not believe that anybody else in the world could so much as comprehend it. "There's only one man in Germany who understands my doctrine," he said, "and he doesn't understand it." But artists of the brush are not the only people liable to become self-wise and stubborn. I have known men of my own craft so set in their own opinion, so settled in their contempt of the opinion of the public, that no failure, no downfall has been enough to disturb their pride. They have resembled the drunken man who, coming to the head of a flight of stairs tumbled down to the bottom, and then, when some one rushed to his assistance, said, "Go away. I don't want any help; that's the way I allus come downstairs." But, gentlemen, there is a great public of limited intelligence and inferior education which it is no degradation to the artist to reckon with. At the Manchester exhibition two factory girls from Bolton stood before Millais's *Huguenots*. They knew nothing of the Massacre of St. Bartholomew and they didn't know what the picture was about. But the expression of pain on the face of the lady affected them to tears and they were wiping their eyes. It puzzled them, however, that the lady should look so sad, being evidently on such excellent terms with her sweetheart. And then there was the handkerchief. What did it mean? At length one of

the girls hit on a bright idea. "I know what's up," she said. "They've been having a stolen meeting in the garden, so as the old folks wouldn't know, and the garden gate has blown to unexpected and clipped the young woman's hand." Fellow-artists, I ask you whether it is not worth while to make your reckoning even with intelligence like that? Remember, the higher your public, the higher will be your art. Lift up your public and your art will be lifted up. This is so of art of all kinds. The better the public for the theatre, the better the drama will be; the better the public for the picture-gallery, the better the pictures will be; the better the public for books, the better the books will be. And artists can contribute to lift up the public by which they are themselves to be judged. I was in Poland two years ago, and saw several of the technical schools which have been established in Krakau and elsewhere by the munificence of Baron Hirsch for the art education of Jewish boys. They are doing a great work, and in another generation they will have wiped out the reproach constantly urged against the Polish Jew that he is a pedlar and a middleman, not a mechanic and producer. They are also doing a great service to the art education of Europe, for they are preparing the way for great artists. Can we not have something of the sort in England and Scotland? Since I came into this room our chairman has told me, to my great delight, that something of the kind exists in Edinburgh. I do not know the Heriot Hospital or the Heriot-Watt College, where there are, I understand, fully equipped workshops for the applied arts and sciences, but all I can say is that as artists, whether painters, musicians or literary men, it is a matter of the highest consequence that we should lift up the art education of the people for our own sakes as artists, if not for the sake of the people themselves. One of my friends, a literary artist of real power, has lately been brave enough to tell the public how stupid the public can be, how many blunders it can make, ranging from the championship of Martin Tupper of "Proverbial Philosophy" in literature to that of John Martin of the *Plains of Heaven* in painting, and in short that neither the public intellect nor what is called the "great heart of the public" is of the least value as a guide in art. Well, I am willing to believe that the public can make mistakes in art matters, but when we see how great are the mistakes of artists themselves, we realise how pardonable are the mistakes of the public after all. Every artist has sooner or later to choose between the two schools George Sand describes, and I confess that my choice was made early. I thought to myself, "I have never met any man yet who could not tell me something I did not know, and the men who can tell me most are (like the sailors who go to foreign countries) the men who live in other worlds than my world." I said to myself, "There may be danger in a too ready submission to the public taste, but if I have anything to say let me not despise the people to whom alone I have to say it; let me make myself intelligible to them, let me speak in their language, even if I have to sacrifice some of the quality of my own; and if I have any good and noble feeling in my soul let me pass it on to other souls, to as many other souls as I can reach and touch." But, gentlemen, the service of the public has its dangers also where the artist is in question. One of these lies in the quest of fame. It is so natural for the artist to desire to be famous. Half the great art works of the world may be said to have been produced by love of the praise of achievement. And it is so natural to conclude that where fame has been won already fame may be won again. Hence there is a danger of running in grooves. But nature does not often repeat herself. It does not often give us the same thing twice. As Emerson says, two really great men of one stamp are hardly to be found in the history of the world. Two really great works closely resembling each other have hardly ever been produced. Nature varies the type. The public is constantly varying in its taste, its want, its circumstance. This is a good thing for some of us. Where should we be if all the world were of the same mind in all the ages? Most of us would be left out in the cold. Then there is always the danger that where art depends largely on the public approval it should seek unfair means of obtaining it. We have heard a good deal about "log-rolling" in recent years, and I dare say fictitious reputations are sometimes rigged up for a while; but that sort of unfair trading is pretty sure to over-reach itself in the end. There is an old story (perhaps none the worse for being old) of a political meeting in America. Whenever a speaker rose to address the audience he was received with cries of "Henry! Mr. Henry! Let us hear Mr. Henry!" always proceeding from one side of the hall. At length, in the midst of these cries and the tumult they occasioned, a little man was lifted on to the platform, and he was invited to speak. But no sooner had he begun than the same cry was repeated. "Henry! Mr. Henry! Let us hear Mr. Henry!" The chairman then said, "I wish that gentleman would keep quiet; Mr. Henry is now addressing the meeting." At that the gentleman who had been making all the disturbance cried, "What? You don't mean to say that's Mr. Henry!

Why, that's the little fellow that's been telling me to holler!" There is another danger in the service of the public, the danger that fame will spoil the artist. We see and hear a good deal of the few men who are killed by adverse criticism, but we do not learn much of the many men who are ruined by fame—ruined to art by the stopping of all artistic growth, ruined to themselves by the world's cruel kindness. It seems as if the moment a man makes a success in the world, the world determines that he shall never make another. If an artist who has suddenly become famous has the temperament of the good fellow, he stands a good chance of being wrecked for life. It seems as if there were a conspiracy of admiration and affection to make him give up to society what was meant for the study. We have all known the wrecks of society—men of genius who ought to have gone higher and higher, but have gone lower and lower because they have served the world too well. Let us never forget that though the ordinary world may broaden our sympathies, enlarge our ideas, feed our imagination, it is in solitude, in the study, in the studio alone that any real art work is ever done. The artist who succeeds must have his head square and level on his shoulders, and indeed all artists in every walk ought to be prepared for whatever fate may befall. I should be sorry to think that great work can ever entirely fail of success. It has not so failed in the history of great artists in any age or country. Shakespeare did not fail, and neither did Raphael. But it is possible for the success that the world allows to artists to be various in kind and quality. It may be wealth and honour and troops of friends with one man, and poverty and unpopularity and the sadness of neglect with another. In the closing incidents of the lives of two great authors, the greatest perhaps of this century—Victor Hugo and Walter Scott—there is a contrast so striking, so pathetic, and I think so thrilling, that I will attempt to describe it as the last words I have to say on this subject. You will remember that after the *coup d'état* of the third Napoleon, Victor Hugo had to fly from France to the Channel Islands. He lived many years in exile, but when Napoleon fell at Sedan, Hugo felt free to return home. M. Claretie tells the story of the home-coming of the great Frenchman on that day, in September 1870. Wearing a soft felt hat and carrying a small travelling bag across his shoulders, Victor Hugo took his ticket for Paris. In the train from Brussels he sat watching with wet eyes for the first glimpse of his old loved country. On the way they passed some of the poor defeated French soldiers, and, thinking to cheer them up, he pushed his head out of the window and cried, "Long live France!" Then night began to come down. It was ten o'clock before they reached Paris. On the platform the poet's friends were waiting for him. They raised a shout, "Long live Victor Hugo!" but there were wounded men in the train, and the shout was silenced. A carriage was in readiness, and Victor Hugo drove out of the station. And there thousands were waiting to welcome him, the great shout was taken up again, and it rolled like thunder over a sea of heads. The poet stood up and bowed and bowed, and the carriage was literally borne along by the multitude. Thus Victor Hugo came back to his country, not a young man as he had left it, but an old man, the idol of the people whom he loved. Now for the closing incident in the life of Scott. Some time after the great failure which wrecked all his fortunes, and nearly robbed him of the house which was his greatest pride, Scott went abroad. In Florence his personality was unknown. One day—I think it was in Florence—he stepped into a printseller's shop and the shopkeeper offered him a print, saying, "This is a picture of the house of the great Scottish novelist." It was a picture of Abbotsford. Choking with emotion Scott turned and went out. Returning to Scotland weak and ill on that home-coming which was to be his last, he could not sit quiet in the coach for his eagerness to catch sight of the beloved house. At length he saw its turrets in the distance, and he could restrain himself no longer. Struggling up, he cried, "There it is, there it is!" and then dropped back weeping. One word more. We hear a good deal about the want of great artists in these days. We are told that there have been no landscape-painters since Turner, no musicians since Wagner, no architects since Pugin, no novelists since Thackeray. Well, it does not become us to say that this is untrue, but if it is so, what is the cause? Is it want of natural genius? Don't believe it. Don't believe that all the genius of the world has suddenly been quenched. My own theory is that, whatever shortcomings our age shows in contrast with other ages is due rather to want of the spirit that inspired our fathers. I believe that it is character that makes the great difference between men. The men of achievement are nearly always the men of character. Napoleon used to say that there was a moment in every battle when the bravest troops felt a desire to fly. That was the moment for the general. He had to step in then and give the word of command, or the battle was lost. Now I believe the difference between the men who succeed and the men who fail is usually that the men who succeed have the voice in their ears which at the right moment when the fight is hardest cries "Forward."

ART IN ABERDEEN.

THE first of a series of popular Saturday evening lectures, arranged by the Aberdeen Artists' Society with a view to popularising the art exhibition and bringing it under the notice of the working classes, was delivered in the exhibition on Saturday evening by Professor Hamilton. Mr. John Keir, president of the Trades Council, presided over a large audience, and in introducing Professor Hamilton said he was sure the lectures could not fail to accomplish the object the Society had in view. He could not introduce Professor Hamilton without making a reference to Mr. Murray, of Glenburnie Park, to whom the Artists' Society, and the working classes in particular, were indebted for his indefatigable efforts and great energy and enthusiasm in this matter. He admitted that the working classes in Aberdeen were indifferent to exhibitions of this kind, but he did not think they were more indifferent in Aberdeen than in other places. He thought also that the reason of the indifference was not far to seek. It was very well known that the workers had too little time at their disposal for mental culture and the development of the finer faculties, but he was not without hope that when more leisure was placed at the disposal of the workers, they would take more advantage of institutions like the Aberdeen Artists' Society, and go in more for art and literature.

Professor Hamilton then delivered his lecture, "A Layman's Impressions of the Exhibition." After a few introductory remarks the lecturer proceeded, the *Aberdeen Free Press* says, to deal with the artist's conception of nature, pointing out that while laymen were constantly looking at objects in nature without seeing them the artist made it his business to observe. But the artist had to do more than this. Were he a mere copyist the result of his labours would be little better than photographic. If he had the true artistic sense within him every line of his brush, every stroke of his chisel ought to idealise, beautify and humanise what was presented to his view. Just as good acting was not a slavish copy of nature so good painting or sculpture limning of any kind was not merely nature but nature subordinated to art. But the quality to do this was rare and should therefore be valued all the more highly, for all professing artists were not geniuses. They had that fact driven forcibly in upon them when they found one of our national heroes represented by a railway sign-post erected upon the most unstable of unstable rocky foundations, our greatest Scottish bard converted into a dancing jackanapes, and our venerable churches, chapels and cathedrals mauled and maltreated by an ignorant architect or decked out in the tawdry splendour of a London gin-palace. The perpetration of such enormities day by day in the streets reminded them that art was a subject requiring to be learnt like any other branch of knowledge. There was, however, no royal road to this education. No man could impart it. All that the best of art instructors could do was to lay down certain guiding principles. The perceptive understanding was a something which springs up after long personal effort. He would, therefore, have every person become his own art critic, for instead of comparisons in art being odious, they were the very means by which a student would come to learn what was meant by art. Let them compare what they saw around them with their own ideal, but of all things let nature be the mirror in which they verified their conclusions. Let them think of what the artist had been endeavouring to teach, and when they began to recognise that what the artist had been trying to teach them was right they were on the high road to improvement. Proceeding, Professor Hamilton said:—We come now to consider what the qualities of a good picture really are, and here we are met with difficulties on all sides. Instead of endeavouring to define to you what a good picture or a bad picture is, I would much rather that you asked me what the legitimate uses are to which a picture may be put. Let me emphasise, however, that there is one style of picture which is unfortunately popular, but which without doubt is radically bad. I cannot better describe it than by saying that you see its counterpart on the backs of Christmas boxes and painted coal-scuttles. And yet how many of our most fashionable artists at the present day, some of them boasting the title of Royal Academicians, are turning out nothing more nor less than this coal-scuttle kind of article. There is the demand for it by the public, and the public gets it. The true test of a good picture is to hang it on your walls and see whether you love it more and more every day of your life, whether every morning when you look at it it breathes to you a message of peace and goodwill towards mankind, whether it elevates you and makes you a nobler and a better man or woman than you were before you became possessed of it. If gorgeousness then is not art what are the legitimate elements which should enter into the composition of a picture?

Well, let me remind you that beauty in nature is a mystery whose influence we all see and feel. Any hard-and-fast line of definition of what it is remains as yet undiscovered; so much so that the artist in painting a picture admittedly beauti-

ful, or in fashioning an ideal in marble, may be regarded as giving expression to the inexpressible. There are, however, certain qualities which, either singly or in combination, enter largely into the construction of a good picture and among these I may mention (1) form, (2) colour and (3) story. There are many others, but these and particularly one of them—namely, colour—stand out prominently. Colour prevails everywhere around us; hence, unless duly represented in the picture, one of its greatest charms will be lost. As to form, just as there is no limitation or rule of beauty in art generally, just as beauty does not reside in the thing recorded, but in the mind of the artist, so there is no canon or standard by which beauty or form can be appraised. Yet, with it all, to him who has reflected upon the subject, there can be only one opinion. The work handed down to us from the ancient Greeks is acknowledged on all hands to be the most beautiful expression of form which we possess, but whether its inherent beauty is solely a matter of lines having a particular curve, or whether it is the perfect adaptation of the various parts to the greatest utilitarian purpose, remains undecided. Grace of form can be given effect to through no better medium than white marble. When we come to use it, however, for mere portraiture, are we putting it to a legitimate purpose? When we perpetuate the memory of a London alderman, an Aberdeen bailie, or, for the matter of that, a University professor, in an actual likeness in marble—a realistic affair in a substance so bland and pure—are we using the proper means to the end in view? What could be more ghastly than a row of busts of the departed executed from a realistic basis. They want only the white sheet around them to make them good-looking stage property. When shall we come to recognise that an ideal subject—a thing of beauty—is a far more pleasing tribute to the memory of the departed than these monstrosities? Give the sculptor a chance. If you have money to spend on marble, put yourself in the sculptor's hands and let him work out his own fancy. But I suppose people will be sculptured and painted in spite of anything which can be said to the contrary, and verily they have their reward. Then as to colour, the colour sense and the sense of colour are, be it remembered, two different things. The colour sense is inborn with most of us—that is to say, we are not actually colour-blind—but the sense of colour is a quality which requires to be cultivated and fostered before it can be enjoyed. We are all constantly looking at colour in natural objects, but very few of us take the trouble to consider how colour effects are occasioned. What, then, is this colour which the artist sees, and which we, the uninitiated, do not see? How can we come to an understanding of it? In attempting to guide you in the matter, let us pull a number of red roses and arrange them in one of those wreath-like clusters which ladies love to paint. You have all seen the article I refer to in our shop windows and on the walls of our drawing-rooms. Paint your roses faithfully as you see them, and examine your work; you will find it is utterly wanting in colour. Undo your bunch of roses and replace them on the bushes from which you pulled them, with leaf, stem, soil, and possibly an old brick garden wall behind them, with a glimpse of blue sky in one corner of the picture, and paint faithfully again what you see. The picture will now be found to be full of colour, and the roses will occupy their right place in the colour scheme. You will see the same thing in what is termed our cold, grey Union Street. Look at the houses as you pass down the street on a sunny day after a shower of rain and notice the intricate interweaving of colours in the granite, more especially in the older houses. Dull grey, pale brown running up actually to crimson, olive green and indigo are the colours which in combination are interpreted by the ordinary observer as grey. Finally, as to story, every picture ought to tell its story, but remember that this story ought to be the artist's own; it ought not to be borrowed. Whenever the artist's craft is employed for illustrating literature or history in a realistic manner it becomes degraded. The story capable of being written in ink is one thing, that which can be recorded in paint or marble is another. Anything of a sensational character or of the melodramatic type serves to lower the picture as a true work of art. The same thing may be said of the ghastly and the horrible. The introduction of an outside story is in reality a confession of weakness on the part of the artist, and when he resorts to it he is dragging his craft through the mire. A picture should essentially be a thing of beauty for its own sake. Its tendency ought to be to enhance the highest flights of the imagination of the ordinary mind by its inherent properties, and the light it lets into our intellects should not be borrowed from extraneous sources. Its beauty should be a thing of colour, form, atmosphere, and all the other qualities which a picture of recognised merit exhibits. For, be it remembered, if we have to go out of our way for its story, if it depicts something which runs counter to what the artist wants to show us, in looking at it our attention is divided between two things, and a sense of confusion and alloyed pleasure is the result. There is a jarring of the two stories, as in listening

to a couple of bands of music simultaneously. The story of a picture ought to be a mystery. It ought to be a thing which we require to seek for, and which ought to grow upon us the more we pursue it. In illustration of what I mean, I think I cannot do better than ask you to stand before Mr. Austen Brown's *Roadside Pasture*. Do you not see humanity shining through the rays of the figure in front and rising superior to the life of hardship which the figure evidently emphasises? Do you not see in the pose of that figure a story of dignity and nobility which no words could express, but which we feel borne in upon us the more we gaze upon it. And yet all this has been told us by the representation of a gipsy out-cast clothed in rags, with an inanimate cow in the background. This is true story-telling in art. We do not require to go back to history in order to understand its meaning. The story is the artist's own, and he has given us a treasure to look upon in recording it.

Mr. Keir proposed a vote of thanks to Professor Hamilton, and Mr. James Murray moved a vote of thanks to the Chairman. The usual evening concert was then proceeded with, while the large company present made an inspection of the pictures.

LEEDS ARCHITECTURAL SOCIETY.

THE first ordinary meeting of the session of this Society took place at the Mechanics' Institute, Cookbridge Street. The president, Mr. E. J. Dodgshun, F.R.I.B.A., delivered the opening address. He first drew attention to the syllabus, which he hoped would prove of great interest. The number of members on the roll was about the same as last session and he thought they might congratulate themselves on their present position. Strength lay in unity. Could they truthfully say they were honestly united in the wish for the welfare of the profession, or were they more anxious about individual success as business men? If not the latter, why was it that so comparatively few of the architects in the district were attached to that Society? The only reason he could give was that they were not sufficiently interested to join. They were not so strong as they should be, consequently their efforts were constantly crippled. If they were united their endeavours would have more weight and they would most undeniably advance their interests. There was a matter which might be made more agreeable to them as a body if they only had unity. He referred to the building by-laws committee of the Corporation and their methods of passing plans, &c. It was positively degrading to be supervised by a set of men—the sub-inspectors—who could not possibly have the experience they, as architects, were supposed to possess, and to have to explain to such how they proposed to carry a wall, ventilate a room or lay a drain. If they really must go on submitting to that state of things, they should at least try to induce the committee to send their inspector to them instead of their having to wait, and often for a very long time, to see him. Why should there exist a building by-laws committee at all? The committee, with one or two exceptions, was composed of gentlemen who had no special knowledge of building, and there was reason to object to those who had, because they were interested in building, either as architects or builders, and by virtue of their office had frequently the opportunity of obtaining information which it was unfair (to the architects sending in plans) that they should have. Would it not be preferable to dispense with the committee and appoint district surveyors, whose duty it should be to see that the laws were not violated or infringed? The inspector had sent into him far more sets of plans than it was possible for him to digest, with the result that sometimes plans had to be deferred, which caused vexatious delay, and was unjust to those anxious to proceed with their work. He need hardly mention, too, the difference between the letter and spirit of the law, but they sometimes had a good deal of trouble in that respect. In London ordinary building plans had not to be submitted to any authority. All that was necessary was to give a couple of days' notice to the district surveyor of intention to build, and he came from time to time to inspect the work and see that the Building Act was not being contravened. Probably the builder might show the plans to the district surveyor at the outset, but they had not to be deposited with him, nor was he furnished with tracings. The Act was so clear and complete that there really was no need for the plans to be approved. They were either right or wrong, and it was therefore not a matter of opinion at all. The plan of the drains had to be submitted to the vestry and approved by their surveyor before they could be put down, but that could be done at any time during the progress of the work, and they had merely to give seven days' notice beforehand. If they wished to do something not provided for in the Building Act, they must see the district surveyor about it, and if he could not deal with the matter the plans had to go before the Building Act committee of the Council. That rule applied, so far as the district surveyor was concerned, to all public buildings,

schools, churches, libraries, &c., but in the case of theatres the plans must be submitted to the Council. Referring to another matter, the President said he thought the city engineer went beyond what should be required of him when he undertook the designing of buildings of an architectural character, such as lodges, park gates, laying out parks and so forth. The city engineer had quite enough to do in his own legitimate line without being expected to make designs for architectural works, and it would be to the city's advantage to appoint an architect for work of that description. The new fish market was ample proof of what he had stated. The year that had just passed had seen some important new buildings completed in Leeds, and much praise was due to the architects. He alluded to the new buildings at the Yorkshire College, the new Medical School, the new Yorkshire Penny Bank, St. Aidan's Church schools erected by the School Board and the new buildings for the Co-operative Society in Albion Street.

A vote of thanks to the President for his address concluded the meeting.

GENERAL.

Mr. Alfred Waterhouse, R.A., is preparing plans for buildings for the Prudential Assurance Company in St. Andrew Square, Edinburgh, the company having purchased the London Hotel for a site.

Mr. J. Oldrid Scott writes to say that a man is calling on various architects and builders representing himself to be a son of the late Sir Gilbert Scott, and asking for assistance. As Mr. Scott adds, "I need hardly say that he is an impostor."

All Saints Church, Norfolk Square, which was destroyed by fire in June last, is to be rebuilt immediately. Mr. Ralph Nevill is the architect. To complete the church according to his designs, the vicar and churchwardens are asking for 2,500*l.* beyond what is at present in hand. It is hoped that the church will be completed soon after Easter, 1895.

The Maire of Ruffey, near Dijon, has insisted on having the *fliche* of the parish church painted in the national colours, the stripes of red, white and blue being arranged longitudinally.

A New Roman Catholic Church is about to be erected in Dunfermline, from the designs of Dr. R. Rowand Anderson, of Edinburgh, which when completed will cost about 30,000*l.*

The Treasury has authorised the payment of 10,000*l.* towards the Aberdeen University Extension Fund for the year 1894-95.

A Site has been purchased in the north-eastern part of Halifax for the erection of a Roman Catholic Church and Presbytery.

Dr. Wm. Taylor presided at the meeting of the Royal Scottish Society of Arts on Monday, when a paper was read by Mr. Ferranti on "Electrical developments of the future and their effect upon everyday life."

The Government it is understood will expedite the scheme for the dock extension at Devonport, on which a sum of 4,000,000*l.* will be expended.

The Death is announced of Mr. C. H. Thornton, architect, of Leeds, at the age of forty-eight years. He had served as secretary and vice-president of the Leeds Architectural Society.

Major-General Sir J. Donnelly, K.C.B., will on Wednesday, the 21st inst., deliver the opening address at the first ordinary meeting of the Society of Arts.

Mr. J. E. Hunter gave a lecture at the meeting of the Glasgow Architectural Association entitled "On Tramp," being a description of tours in Northamptonshire, from Kettering as a centre, undertaken in September of this year.

Mr. Percy Brown, of the Municipal School, Birmingham, has been appointed as draughtsman to the Egypt Exploration Fund.

Mr. E. Stannus gave a lecture on Tuesday before the Sheffield Society of Architects on "The Three Greek Orders—Doric, Ionic and Corinthian."

Mr. J. Oswald, president of the Northern Architectural Association, delivered the opening address of the winter session on Wednesday, the 14th inst.

Mr. Alexander M'Gibbon gave a lecture in the Glasgow Corporation Art Galleries on "Gothic Architecture: its Place and Power."

Mr. T. L. Watson presided at the conversazione of the architectural section of the Glasgow Philosophical Society, and was supported by Mr. John Honeyman, past president.

Mr. C. O'Neill, the author of "The Textile Colourist," and other works relating to Lancashire industries, died at Sale on Monday last.

Mr. J. M. Gray, the late curator of the Scottish National Portrait Gallery, has bequeathed over a hundred volumes relating to heraldry to the Lion Office, Edinburgh.

The Architect.

THE WEEK.

ALTHOUGH Mr. SILVANUS TREVAIL, the architect, is not a member of the Corporation, he was elected Mayor of Truro on the 14th inst. A local paper says that since his advent to Truro, in 1880, Mr. TREVAIL has taken a very prominent part in municipal and county matters, having rendered good service to the citizens of Truro as one of their representatives on both the Town Council and the County Council. As chairman of the sanitary committee of the County Council, he has during the last two or three years done more than anyone else probably to improve the sanitary condition of Cornwall, and for his work in this respect the county owes him a deep debt of gratitude. It is further indebted to him for the part which he played in "The Battle of the Railways" last year. By his prompt and resolute action in acquainting Parliament with the real state of public feeling in Cornwall in regard to the question of railway development, he accomplished an unprecedented feat in inducing the House of Commons to reject the Truro and Newquay Junction Bill, after it had been passed by the Select Committee. By his action in the matter he won the thanks of the whole county, and the feeling of gratitude will shortly find tangible expression in the presentation to Mr. TREVAIL of a testimonial of over 300*l.* value.

At the present time the name of THOMAS CARLYLE is not a strong one to conjure guineas, although a reaction is inevitable. But if the modest house in Cheyne Row, Chelsea, where he lived for nearly fifty years, is not secured, it is certain to be transformed, and hereafter, when CARLYLE'S powers are once more prized, it will not be worth acquirement by his admirers. Another appeal has been made by the committee for subscriptions towards the purchase money and expenses. The cost of the house will be 3,760*l.*, but it is proposed to raise 4,000*l.* When purchased, the property will be invested in trustees; and it is intended that a collection of CARLYLE'S memorials should be gradually accumulated in the house, with a view to its being opened as a kind of museum. Mrs. ALEXANDER CARLYLE, of Edinburgh (CARLYLE'S niece), has offered to place in the house sufficient of the old furnishings to form a substantial nucleus for the collection. Of the numbers that annually visit the house no record has been kept. Last year between six and seven hundred people visited the birthplace at Ecclefechan, and, considering the relative accessibility of the two places, it may be taken as certain that the visitors to Chelsea would be much more numerous. The option of purchase expires on December 31.

THERE is no more effectual way of entombing knowledge than by printing it in a blue-book. Although from time to time there are references to the reports of the Royal Commission on the Fine Arts, that is to say, on the employment of fresco in the Houses of Parliament, yet it is evident that the public as well as many amateurs have only vague notions about the peculiarities of fresco painting. Mr. CAVE THOMAS (who in any other country would have gained eminence in mural painting) is therefore opportune in pointing out that "there is only one proper or *buon fresco*—that in which the painting is made on wet mortar composed of pure lime and clean river sand. Paintings in this method, when properly executed, will stand. The mortar so constituted and used by the Romans has stood in this climate through the centuries and is now as hard as stone. The occasional use of pozzuolana or marble dust in fresco grounds dates from very far back, as may be gathered from the reports referred to. Art critics old enough to recollect the Westminster Hall competitions may be able to call to mind specimens of several methods of mural painting in fresco, in encaustic, on patent cements, &c. Since then KAULBACH in the New Museum at Berlin, and MACLISE in the Houses of Parliament, have used the Waterglass process. In discussing the degrees of durability of various

methods of mural painting, it is too frequently forgotten that the durability of fresco was not the only virtue that recommended it to the great masters; there was before all else its pre-eminence as an architectonic method of decoration. In all attempts to tamper with *buon fresco*, with the object of increasing its permanence, that pre-eminence is more or less sacrificed. All the transcendent mural works of the great Italian masters were executed in *buon fresco*." If the painters had been left to themselves the Westminster paintings might have been more successful, but the chemists were able to persuade the Royal Commission about discoveries of means to overcome time itself, and in consequence the scientifically prepared frescoes have either vanished or become invisible.

THE facilities for reproducing old etchings will keep ALBERT DÜRER'S reputation undiminished. The copies which are seen in Mr. LIONEL CUST'S "Portfolio" monograph, "The Engravings of ALBRECHT DÜRER," are almost as valuable for the purposes of study as the costly originals. The selection does justice to the various characteristics of the German artist. Mr. CUST'S memoir is learned and judicious. The subject is fascinating, for DÜRER suffered in silence throughout his life, but whether the cause was hypochondria or domestic broils can never be determined. If he were happier his work would have assumed a different sort of character, and DÜRER'S misery may have benefited the world.

ON Tuesday the Lord Provost of Edinburgh introduced the subject of the Municipal Buildings. He said, "If we are to do the city's work properly we must have suitable rooms in which to do it. The accommodation in the City Chambers at present is far too limited, and we shall require to face the extension of the present buildings in the near future. Under the able superintendence of the Dean of Guild, who is taking a deep interest in the matter, and of the city architect, Mr. MORHAM, I have no doubt a plan will be produced which can be carried out at as small a cost as possible." It may be granted that it is possible to make arrangements which will not impose a heavy tax on the citizens. But is economy to be the only consideration? The people of Edinburgh to a large extent are enabled to live in prosperity by the attractiveness of the city. If every building in it had been "carried out at as small a cost as possible," the citizens would be as poor as their predecessors in the last century.

JUDGMENT has been given by Sheriff HENDERSON in the Greenock Court in a case where Messrs. M'ARTHUR & ORKNEY, factory architects, sought to recover 45*l.* 4*s.* 6*d.* for professional services. They were asked by the manager of the Brewers' Sugar Company, Limited, to prepare two designs. The plea put in by the company was that the employment was gratuitous. There was no doubt that more extensive premises were arranged for than were originally proposed, and the plaintiffs therefore offered their services at very low rates. The Sheriff, in giving judgment for 37*l.* 6*s.* 6*d.*, said he did not think the company dealt fairly with the account, by admitting the fee of 2*l.* 2*s.* and maintaining that 20*l.* was an excessive charge for a mere preliminary design. A few shillings would be sufficient for the draughtsmanship of the designs, but what the plaintiffs chiefly required to charge for was the time and labour expended previous to putting pen or pencil to them. The plaintiffs had, however, in his opinion failed to prove that the design referred to was adopted by the company. Instead of erecting a sugar store at the estimated cost of 2,680*l.* as originally proposed, the company had erected a factory costing 6,000*l.* The designs were prepared by Mr. HOUSTON, who had never seen the plans prepared by plaintiffs. There were undoubtedly some features in common between the two designs, and the Sheriff thought these were probably suggested by the manager, to whom the plaintiffs' designs had been previously submitted. This might entitle plaintiffs to a higher fee than they could have reasonably claimed if their designs had been absolutely useless to the company, but it was not sufficient in his opinion to justify so high a fee as that charged on the assumption that the complainers' designs had been adopted by the defendants.

JEAN BOULONGNE.

TO be a "model man," an example of all the proprieties, is not always an advantage for an artist who aspires to fame. It is natural to suppose that the most legitimate way to insure immortality is by works. There is no certainty, however, that works of art will be preserved, and it often needs only the operation of a short period of time to deprive them of interest. An artist who has taken part in dramatic scenes can aspire to be remembered, although his productions are unknown.

■ The contrast between the fate of BENVENUTO CELLINI and his contemporary, JEAN BOULONGNE, JEAN BOULOGNE, JEAN DE BOLOGNE, GIOVANNI DA BOLOGNA, and JOHN OF BOLOGNA, is an example of our meaning. There are very few examples of sculpture or jewellery which can be accepted with certainty as CELLINI's, and they are not all masterpieces. Yet it may be assumed that, in spite of the deficiency, his hold on posterity will remain as long as MICHEL ANGELO's or RAPHAEL's. To the majority of people his adventures are of as much importance as the works in the Capella Sistina or the Camera della Segnatura. Almost all of the works of JEAN BOULONGNE, on the contrary, have been preserved, and yet his name is nearly effaced from the historic scrolls. His sculpture is far superior to CELLINI's, and MICHEL ANGELO would be likely to have allowed that JEAN was the best of all his imitators. But his life was devoted to his art; he was not known to be the hero of the simplest sort of drama, he discharged all his obligations, and was never known to have defrauded or killed a man, and in consequence the world has become indifferent about him, if not about his works.

JEAN was one of the very few foreign artists who were able to obtain commissions in Italy, for although the Italians considered they possessed a right to employment in all lands where art was esteemed, they were not disposed to admit that they required the aid of strangers. In their conduct the artists imitated the Churchmen. That an exception was made in BOULONGNE cannot be doubted, and from what is said by VASARI it would seem that there was not much jealousy about the patronage he obtained:—

The Flemish sculptor, Giovanni Bologna, of Douai, is also of our Academy, and his remarkable ability has caused him to be much in the favour of our princes. He is, indeed, a young man of singular talent, and it is by him that the new fountain on the Piazza of San Petronio, opposite to the Palace of the Signori at Bologna, has been constructed. Among other ornaments there are four syrens at the angles, which are exceedingly beautiful, as are also the children and fanciful masks by which it is surrounded. But the most remarkable part of this work is a figure of *Neptune*, six braccia high, placed over the centre of the fountain, and which is a most beautiful casting, the figure being studied and executed to perfection. And, not to speak now of what this artist has produced in clay, terra-cotta, wax and other materials, he has executed a beautiful *Venus* in marble, and almost completed a *Samson*, the size of life, in combat with two Philistines, for the Prince. He has likewise made the figure of *Bacchus*, in bronze, larger than life, and in full relief, with a *Mercury* in the act of flight, which is very ingenious, the whole figure resting on the point of the foot. This has been sent to the Emperor Maximilian, as the extraordinary work that it certainly is. But if Giovanni Bologna has hitherto produced fine works, still finer may we expect from him in the future, seeing that the Prince, after giving him rooms in the palace, has lately commissioned him to execute a statue of five braccia high, representing the Goddess of Victory with a captive, and this work, which is to be placed in the hall opposite to one by Michel Angelo being accomplished, Giovanni will be employed on many other great and important undertakings for the same Prince, thus obtaining a wide field for the display of his powers.

It is remarkable to find so genial a notice of a young foreigner coming from VASARI. He was prepossessed not only by the ability of JEAN BOULONGNE, but also from the connection of the sculptor with a builder who carried out works designed by VASARI, and it may be from the admiration of MICHEL ANGELO, which the Fleming and the architect held in common.

The number of works credited to the young Fleming by VASARI must appear incredible. It should be remembered that he was an efficient sculptor at an early age and when commissions were given to him he completed them quickly. His energy was as dominating as MICHEL ANGELO's, and whatever may be their shortcomings in other ways his figures appear to be first thoughts. In productiveness there is a resemblance between BOULONGNE and RUBENS. Both can express movement and vigour in a marvellous way, and consequently scenes in which brute

strength overcomes resistance have an attraction for them; but RUBENS's animalism is compensated by his colouring, while in the case of BOULONGNE we must be satisfied with the flexibility which marble and bronze appear to have assumed under his hands. The Flemish sculptor apparently was eager to produce figures which the crowds in a public place could understand at the first glance; he therefore avoided subtleties of all kinds and, as a consequence, there is no revelation of a hidden meaning, however long we may study his works. It is by that absence of an occult significance the works of the imitators of MICHEL ANGELO's muscularity can be always separated from those of the great Florentine. But with BOULONGNE there is at least the satisfaction of feeling that he was not vain of his anatomical knowledge, and therefore we do not see from his hand such distorted figures as were common with his contemporaries. Whatever he attempted he executed in a workmanlike style, and as within the limitations adopted his groups are generally successful, it is difficult to resist the conviction that BOULONGNE was competent to produce many figures that would bear comparison with his *Mercury* if he cared to free his powers from restraint.

The story which is introduced by Sir JOSHUA REYNOLDS in his tenth discourse is by itself enough to suggest, that BOULONGNE and his friends invented subjects without much trouble to themselves, and the President accepts it as an indication of the true province of sculpture, which was confined to attitude and action:—

Take from Apollo his lyre, from Bacchus his thyrsus and vine leaves and from Meleager the boar's head, and there will remain little or no difference in their characters. In a Juno, Minerva or Flora the idea of the artist seems to have gone no further than representing perfect beauty, and afterwards adding the proper attributes, with a total indifference to which they gave them. Thus, John de Bologna, after he had finished a group of a young man holding up a young woman in his arms, with an old man at his feet, called his friends together to tell him what name he should give it, and it was agreed to call it the *Rape of the Sabines*, and this is the celebrated group which now stands before the Old Palace at Florence. The figures have the same general expression which is to be found in most of the antique sculpture; and yet it would be no wonder if future critics should find out delicacy of expression which was never intended, and go so far as to see in the old man's countenance the exact relation which he bore to the woman who appears to be taken from him.

There is little doubt about the error of REYNOLDS when he assumed that figures by Greek sculptors are only to be differentiated by means of certain symbols and attributes. The characterisation was expressed in other ways. But what he says reveals that in the eighteenth century a want of definiteness in intention when undertaking a sculptured figure was not considered a disadvantage. Assuming that REYNOLDS expressed a tradition of the studios, there is consequently some excuse for BOULONGNE when he thought far more about the effect of the contours of his groups on the multitude ("his groups," says FLAXMAN, "are harmoniously incatenated") than about the meanings which a few meditative men might infer from them. Neither BOULONGNE nor REYNOLDS cared much for the refined critics who please themselves in discovering "delicacy of expression which was never intended," and they resembled TURNER, who was not grateful to Mr. RUSKIN for efforts which had a similar tendency.

BOULONGNE it should not be forgotten was a Fleming, and retained to the end of his life many of the qualities of his countrymen. He was born at Douai, about 1524. If he accepted the destination prepared for him by his parents he would have been a village notary, but when he was sixteen he went to Antwerp and became a pupil of JACQUES DUBROECK, one of the Flemings who had studied in Italy. That master used to recommend all his pupils to seek instruction in Rome, but owing to his poverty, JEAN BOULONGNE was unable to set out on the journey until after a period of ten years had elapsed. His two companions were CORNILLE, who was an architect and sculptor, and who is said to have designed the Antwerp town hall, and FRANC, a painter. At that period it was the ambition of all young sculptors to become acquainted with MICHEL ANGELO. The Fleming modelled a wax figure with all the care he possessed and submitted it to him. MICHEL ANGELO transformed it and advised JEAN BOULONGNE to learn to sketch in the first place, and the power to finish would follow. Apparently that was JEAN's only encounter with the sculptor, but it was sufficient to confer prestige upon

him, and some modern writers on the strength of it do not hesitate to say that JEAN BOULONGNE was among the very few pupils of the master.

The Romans were not disposed to patronise foreigners, and JEAN BOULONGNE resolved to return to Antwerp. As he passed through Florence he met BERNARDO VECCHIETTI, one of the influential amateurs of that city. By his advice BOULONGNE rested in Florence, and was received in VECCHIETTI'S house. He endeavoured to become useful, and was glad to carve balusters and consoles until the opportunity to produce statues arrived. For an example of the latter it was necessary to possess a block of marble, which in those days was costly in Florence, owing to the difficulty of carriage. Every one remembers the story of the partly used block for which so many contended, and which eventually MICHEL ANGELO obtained and converted into his *David*. The disposal of the block out of which AMMANNATO carved the *Neptune* gave rise to as many intrigues in the Florentine Court as if it were the viceroyship of a kingdom. BOULONGNE was more fortunate than greater men, for his patron presented him with a block for his *Venus*, his first work of importance, which at once secured the interest of FRANCIS DE MEDICIS. The Fleming was offered quarters in the palace and a salary of thirteen gold crowns (afterwards increased to twenty-five crowns) was assigned to him. That commissions at once came in abundance is evident from VASARI'S list, which, as we have seen, comprises not only the *Samson and Philistines*, the *Bacchus* and the *Mercury*, but the fountain in Bologna; the last, however, was designed by TOMMASO LAURETI, the painter. At the time of their completion BOULONGNE was described by VASARI as a young man.

He was, however, thirty-five when he produced his *Samson* group and may have reached his fortieth year when he completed his masterpiece, the *Mercury*—a figure which, it is supposed, inspired SHAKESPEARE'S lines about the feathered god alighting on a heaven-kissing hill, although the sculptor substituted a head of one of the wind spirits for a hill. It was an age when mythology was in fashion as well as a liking for the colossal, and JEAN BOULONGNE was ready to produce works of both sorts at an hour's notice. His groups have also the advantage of effectiveness when seen in the open air. The Ocean and river goddesses in the Boboli Gardens form a combination that offers an acceptable contrast to the prim lines of the Italian gardeners, and the *Sabine Group* would appear far more satisfactory if it could be taken out of the Loggia and set up in a public place. The *Victory*, or, as it is sometimes called, the *Virtue and Vice*, suffers from its proximity to MICHEL ANGELO'S group in the Palazzo Vecchio, and would we believe gain more admiration in a position out-of-doors where it did not provoke a contrast. BOULONGNE was so addicted to mythological representation, he was not at his ease either with portraits or ecclesiastical figures. His *St. Luke* is about the worst of the series in Orsanmichele. The equestrian statues of *Cosmo I.* and of *Ferdinand I.* are barely tolerable. His statue of *Henri IV.*, which stood on the old Pont Neuf, is only to be judged from the slight indication of it in views of Paris. His ornament, nondescript figures for fountains, torch-holders, &c., are among the most interesting of the Renaissance examples.

As BOULONGNE rarely executed figures on a small scale, examples of his works are almost unknown out of Italy. An *Esculapius* by him was said to have found its way to Meudon and a *Cupid and Psyche* to Versailles. He received offers of commissions from France, Spain and Germany, but the Grand Duke would not allow him to accept them unless he had received official approval. It was therefore necessary to negotiate with the MEDICI for a figure by the sculptor, and diplomatists may not have cared for the duty. BOULONGNE did not suffer. In a communication to a Duke of URBINO he is described as having a thousand things in hand, and as being unable to satisfy all the demands for his work, although he never lost an hour by day or night, for he could undergo excessive fatigue without repose. In spite of his excessive labours, he lived to the age of eighty-four. He gained a large income, but he lived as a grand seigneur, and he took care to be buried as one, for he expended over six thousand golden crowns on a monument in the Nunziata. His property he bequeathed to a nephew from Flanders, whom he treated as a son.

BOULONGNE'S life was singularly free from the excitement which arose out of the competition between other artists of his time. His name is associated with only one competition, and he took part in that on the understanding that he was not to be recognised or rewarded. It arose out of the immense block of marble which BACCIO BANDINELLI arranged for in the expectation of using it for a group of *Neptune* drawn by six horses. When afterwards it was purchased by the Duke of FLORENCE, several sculptors endeavoured to oust BACCIO from his lien on it. After his death a competition was arranged, in which JEAN BOULONGNE took part. But the Duke declined to look at his model, although it was said to be superior to the others, because the Fleming had not at that time undertaken a work in marble. Through the influence of VASARI the commission was secured by AMMANNATO.

The passionate rivalry between artists appears to have subsided towards the close of the sixteenth century. It was, we suppose, perceived that an industrious and quiet man like the Fleming was more likely to carry off a succession of prizes than belligerents of the CELLINI type. Whatever was the cause, when after the fire of 1595 it became necessary to construct bronze gates for the cathedral of Pisa, to take the place of those which had lasted for four centuries, it was decided to leave the whole work in the hands of JEAN BOULONGNE. That course was different from what took place in the case of the Florentine Baptistery, for although there were great sculptors in the city, all the masters in Italy were invited to compete. The Fleming employed numerous assistants, who made models in wax from his sketches, and he entrusted the casting to DOMENICO PORTEGIANI, a monk who had before co-operated with him. The gates have not the charm of Ghiberti's, and in several of the reliefs there is a lack of repose, for he cared only for movement; but they form a most worthy crowning work for the career of the sculptor, who if not the greatest was the most fortunate of all those who laboured in Italy during the sixteenth century, and their production without any hitch or dispute suggests the organising power which was one of the causes of his unexampled success.

NOTES ON THE GREAT RAILWAY STATIONS OF LONDON.—IV.

[BY A CORRESPONDENT.]

(Concluded.)

THE modest-looking red brick façade of the St. Paul's Station of the London, Chatham and Dover Railway stands rather at a disadvantage, owing to directly abutting a high viaduct which dwarfs the small towers built at each end. As regards the exterior, this is certainly the least vulgar of any of the London examples, and possesses some real architectural claims. Moreover, it looks like what it is, viz. a booking-office on the ground floor with clerks' offices above, being only a two-storeyed building. The name of the station is tastefully shown by gilded projecting letters, and those of the various towns, &c., to which passengers can be booked are arranged in incised gilt rows on the two pilasters, thus forming a decorative feature. Now all this shows much better taste—the incorporation of names of places as a part of the construction, instead of the far more common "railway-station style" of big painted boards, though the exact mode of doing this might have been improved upon. The way in which the width of the large semicircular headed windows to the booking-hall is broken up by divisions into ornamental panels separated by delicate wood bars is happy. This also tends to bring these windows more into scale with the rest of the building. As Queen Victoria Street is of good width and the front of the station is no great height, a good view can be thus obtained. The booking-hall is fairly lofty, and the bressumers carrying the rooms above have panelled soffits, with timber trusses of ornamental character under. The ticket-offices are of better appearance than in most stations, but when the passenger has ascended the first broad flight of stairs, he comes to a moderately wide gallery about the whole width of the station, though of insufficient height. Here he will find numbers of people waiting till the wicket-gates of the several smaller staircases leading up to the platforms are unlocked

by the guard. This waiting-space certainly looks inconveniently crowded, though the writer saw it about four o'clock on a Saturday afternoon after the great rush of City men homewards. The station proper calls for no particular remark.

The great terminus of the Midland Railway at St. Pancras is without doubt the finest one in London, though the next and last to be commented upon runs it very hard. The St. Pancras example, too, is less disfigured by those sordid though strictly necessary accessories, commercially speaking, for the dividends, than is the case in other stations. For instance, the advertisements are far less obtrusive. The magnificent Hotel must not be commented upon, for this article is about *stations*. Sir GILBERT SCOTT was much hampered in having to provide ample carriage entrances through the Hotel, of sufficient height and dignity, while still carrying a continuous corridor through the upper floor. On the whole the treatment of this unwelcome intruder has been well managed, though the ironwork supporting it is designed in the ultra-Gothic fashion which would at the present day be called "Philistine." But the composition of the covered glass carriage-roof in front of the booking-hall is a distinct advance over those in other stations, showing how the artistic perceptions of the architect have been employed. This is also shown by the handling of the spandrels to the brackets supporting the roof, the construction of which is simple and unadorned enough, the span being small and no engineering difficulties existing. About this station it may be said that beyond the Hotel frontage and general approach there is really no exterior to speak of. The fine booking-hall with its open-timbered roof and beams of that ample scantling of which Sir GILBERT SCOTT was so fond is very effective, and the ticket-offices instead of looking like ugly shed excrescences rather err in the other direction, being somewhat overdone in ornamentation, all too executed in that costly material—wainscot oak. The stop-chamfering, after the French manner, so ably illustrated in VIOLLET-LE-DUC'S "Dictionnaire," was a prevalent weakness with English architects at the time this station was built and can be smiled at now. But of course this foible does not affect the general conception of this noble structure. It was and will be a very rare occurrence for an architect to have such a "fling" and the *carte blanche* as in this instance—to design not only the principal but the smallest fittings of an enormous railway terminus, such as the oak frames to the time-bills and even the framing to the luggage label collection—also the "sentry-box" in which the official jots down his memoranda as the cabs are driven through the exit archway. There was an awkward point to be dealt with in the management of the screen at the upper part of the south end of the station, only the lower portion of the Hotel being open to it. Herein lies an essential difference as compared with the Charing Cross and Cannon Street stations. There had to be sufficient space between to light the upper rooms of the back part of the Hotel, and this interval has a span roof with axis east to west. The engineer had consequently to provide visible girders of enormous strength to carry this immense screen. The writer believes the treatment of this was a great crux to Sir GILBERT SCOTT, so that it might harmonise with the architecture, and it was well got over too. In the construction of the station roof the engineer has dispensed with tie-rods, and relies on great lattice iron girder trusses at intervals, with trussed purlins and long diagonal ties stretching across the surface of the roof, the latter glazed on the narrow ridge and furrow principle in a very effective manner. The mode adopted here, with an uninterrupted central area of glass, is much the most pleasing, a treatment in other stations which has been previously alluded to. When the handsome tile frieze to the roof was being fixed all flush, it was found the effect was poor, and some of the tiles were therefore set back a little, which was a great improvement. Yet looked at from below, it is difficult to realise all are not in the same plane. All this shows the minute attention to detail paid by the talented architect. The east side of the station is practically all roof, as the inferior offices are too low to "tell," and the chimneys with the huge mass behind them ought by rule to smoke. The west side is masked externally partly by the wing of the Hotel and also by the great goods station, with a road between, only used for access to the

latter. Taking it altogether it is most refreshing to observe the care and study bestowed on this beautiful building as compared with some of the other examples previously touched upon.

The Great Eastern Railway terminus at Liverpool Street is on the whole, in the opinion of the writer, the most interesting one in London, and probably has the largest amount of local daily passenger traffic. It has been indeed no easy matter to quietly study its architectural peculiarities, for "star-gazing" in its precincts puts a man rather out of touch with the busy, hurrying throng around, while the porters, with their modern ejaculation of "By your leave," oblige one to attend to mundane matters, or the penalty is to have one's toes run over. This is of course more or less the case in other stations, but the one in question bears the palm of being the most bustling of all. The plan of this great building, with its very important eastern extension, barely complete, is somewhat intricate—very different to that at St. Pancras, for the booking-offices of the main line are on the low level, and those of the suburban and local traffic on the high level. Hence the great number of gallery passages, foot-bridges and staircases at all angles and in various directions. But the worst of it, artistically, both in this and other big stations is that all seem like after-thoughts, put up regardless of appearance—utilitarian to the last degree. Therefore the lattice girder principle, as at King's Cross Station, has been adopted, with the footway hung on stirrups. The connection of the old station with the very large supplementary one on the east side, owing to the exigencies of the site, must have been no easy matter, and has involved unusually long, tortuous bridges for passengers. The adaptation of the thirteenth-century style to the Hotel, station and offices is of course now not fashionable, but the ornamentation is not overdone, which is more than can be said of much of contemporary architecture. The buildings in general certainly form a somewhat imposing pile, as viewed from Liverpool Street, which is helped by the clock tower, though that is rather in the background. It is superfluous to say that in point of grandeur and architectural merit this structure is inferior to the rather overdone terminus at St. Pancras, but is quiet and modest in its character, not to say mediocre. The plan of the older station may be said to consist of two wide span-roofed "naves," with narrower north and south aisles, the latter having span roofs to each bay at right angles to the main roof, opening partly into it. At the south end, next the west local station, is the "transept" roof intersecting that of the "nave," the diagonal trussed ribs of which give somewhat the suggestion of groining. The effect of the two columns (with axis east to west) dividing the two "naves" and placed some way apart has a bold appearance. This intermediate space is roofed, bay by bay, at right angles to the main roof. The design of the ironwork is rather more ornamental than in the generality of stations, but in other respects is of the usual type. The treatment of the (unglazed) lancet "windows," with the graduated quintet in the upper part of the transeptal west gable and the triplets to the sides of the "aisles," is somewhat ecclesiastical looking; moreover, too, much suggesting the presence of non-existent vaulting. The manner in which the easternmost "nave" roof is carried on, *per se*, past the main line booking and other offices, &c., on the east side into the north end, which is on a splay plan, must have been schemed with some amount of skill. Everything works in very well and the continuity of the roof is maintained, the south "aisle" being curtailed in width part of the way. The booking-hall of the main line is a fine lofty apartment, though purists might say it was wrong in principle to have three tiers of windows in it. But under the uppermost tier runs a gallery, carried on cantilevers, which gives some reason for the treatment adopted. The front of the Hotel at the end of the platforms scarcely attracts any attention, owing to the plan of the station and the presence of the footbridge just in front of it. The north end of the older station is not glazed at the springing line of the roof, like most other examples, but is quite open. The spandrels here externally have poorly designed panels in them. But for all practical purposes this end of the building is invisible from the outside. The west side of the station proper is next to a long goods yard adjoining the

North London Railway Terminus, so is scarcely seen. The semicircular arches and wall over, dividing the older and the new station, are treated in a pleasing as well as bold and substantial manner, likewise the effective blind-storey, or kind of arcade just under the roof. The extension is constructed on the more practical view of lesser spans and consequently less height up to the wall-plate, and consists of four "aisles" of equal width with a non-intersecting transeptal roof next the entrances, running independently of the other roofs the whole width of the station. So there are thus four arches to see opening out of the transept. As the booking-offices are on the high level there are no less than three staircases down to the platforms, the central one T-shaped at the lower part in order to diminish its projection into what is an unusually wide and ample space in front of the platform wickets. The two end staircases are in one flight. A new departure in railway station arrangements has been made in this instance, for instead of the usual wooden structures to serve for lavatories, &c., there are here four substantial little buildings of brick and stone, with one or more staircases leading down to a basement, lighted from the pavement. The space thus gained on the ground-floor level is advantageous, as has been remarked, avoiding crowding. But it is questioned whether the majority of passengers, who are generally in a hurry, will like having to rush up and down these certainly well-lighted steps, and run the risk of tripping or jostling against each other on a staircase, which is very different to a level pavement. The ends of the "transept" are treated in an ornamental way, in, say, the Neo-Renaissance style. That next Bishopsgate Street has window-like openings with very elegant wrought-iron grilles in them, the remainder of this façade being unpierced. It is to be regretted that offices had to be built over the north end of the station, as this has a deadening and depressing effect. But "Necessity knows no law." Externally the east elevation of the transept is handsome, flat at the top to some extent, but still suggestive of a roof behind. "The East Side Suburban Station," to use the official title, has a front of good appearance, red brick with freestone dressings, and looks what it really is. One enters a noble booking-hall (barely yet finished) with ticket-offices and walls of wainscot, handsomely though quietly panelled, one on either side of the principal doorway, arranged somewhat on the principle of a splayed bay-window, but the cornice, &c., is continued over this entrance with a panelled soffit. Moreover, the inner doors open back like shutters on the bevel. The jambs of the doorway are on a bold rounded plan, as if to withstand the expected rush and crush of the numerous daily and other passengers. The booking-hall is wainscotted all round to a good height, and is not overdone with ornament, while the proportions are very pleasing. Altogether it is the most successful feature of its kind in London.

What a vast change has been effected in a dingy part of Bishopsgate Street by the extensive range of handsome, well-designed, red brick and freestone buildings in connection with this terminus, instead of the poor-looking tenements that used to be there! The ground storey, except at the north and south ends, is devoted to shops, and the upper portion, it is to be presumed, for station offices. There are two fine carriage arched entrances at the north end of this great block, and a goods booking-office with picturesque turret. It may be added that some really good perspective effects can be obtained from the interior of the new station, looking towards the older one.

The writer had intended to have made some general suggestions at the end of this article, but has rather exceeded his limit already. Moreover, while describing the various railway stations, he has endeavoured to draw some conclusions from each. It ought to be remembered that there are a considerable proportion of people who for various reasons have to wait about, so that care bestowed on architectural details is not thrown away, because many are unobservant and hurried. Also the division of a large terminus into several aisles is preferable to the huge one-span roof, both for practical and artistic reasons, while it is less costly, too.

The Surveyors' Institution meet on Monday, the 26th inst., when Mr. A. Dudley Clarke will read a paper entitled "The Incidence of Taxation on Land."

THE ROYAL SCOTTISH ACADEMY.

AT the annual meeting of the Royal Scottish Academy the following report was adopted:—

The Council for the year ending November 14 have to report to the annual assembly of Academicians as follows:—The sixty-eighth exhibition was opened on Saturday, February 17, and was closed on Saturday, June 9. It contained 447 paintings in oil and water-colour, 38 works in sculpture, 33 architectural drawings and a number of etchings. At a statutory assembly of Academicians held on March 7, it was unanimously resolved that no addition be made to the number of Associates this year.

The following is the report of the librarian and the curators of the library:—The following works, besides art periodicals and the Arundel Society publications have been added to the library:—"Kuskin on Music," edited by A. M. Wakefield, 1894, 4to; "Verona and other Lectures," by John Ruskin, D.L., LL.D., with illustrations from drawings by the author, 1894, 4to; "Letters addressed to a College Friend during the years 1840-45," by John Ruskin, 1894, 8vo. The following works have been presented to the library:—"Rembrandt: His life, his work and his time," by Emile Michel, member of the Institute of France. From the French by Florence Simmonds. Edited by Frederick Wedmore. With 67 full-page plates and 250 text illustrations. In two volumes. 1890. Imp. 4to. Presented by Sir George Reid, P.R.S.A.—"Illustrated Catalogue. Victorian Art Gallery." Edition de luxe. No. 123. 1894. Presented by the Trustees of the Public Library, Museums and National Gallery of Victoria per Vice-President.—"Umrisse zu Goethe's Faust," gezeichnet von Retsch. Demy 4to. n.d. Presented by Alexander Fraser, R.S.A.—"Die Malerei in Schottland." Von Cornelius Gurlitt. Illustrated. 1893. 8vo.—"Japanese Sketch-book," containing 66 coloured plates, in three volumes. 8vo. Presented by Otto Leyde, R.S.A.

The visitors of the Life School report as follows:—"The session of 1893-94 commenced on November 13, 1893, and ended on June 29, 1894, having had 120 morning and 122 evening meetings. The aggregate morning attendance was 953 and the aggregate evening attendance 952. The number of students on the roll at the end of the session was nineteen. It is gratifying to report that the students have worked with industry and enthusiasm during the session. The visitors desire to allude to one who for many years was intimately connected with the school, the late Clark Stanton, its esteemed curator. They are sure the students feel with them that his death is a loss to be deplored.—(Signed) HUGH CAMERON, ROBERT ALEXANDER, WM. HOLE, ROBERT M'GREGOR, Visitors." After a careful examination of the students' work done during the past session, the Council, who have pleasure in testifying to the general excellence of the work, especially of the studies in black and white, awarded the prizes as follows:—

The Chalmers Bursary—C. S. Brown and George Gibb—equal; the Chalmers-Jervis Prize for the best drawing from the life—J. T. Murray; MacLaine Watters Medal—C. S. Brown; the Keith Prize—George Smith; the Stuart Prize—George Cruickshank.

The Council regret having to record the death during the past year of two Academicians, an honorary member and an Associate of the Academy, viz.:—Mr. Clark Stanton, R.S.A. (January 8); Mr. Gourlay Steel, R.S.A. (January 31). Mr. William Calder Marshall, R.A., one of the honorary members of the Academy, died in London on June 16; and Mr. Charles G. H. Kinnear, A.R.S.A. (November 5). Mr. Kinnear, it was stated, was present at a meeting of the Alexander Nasmyth Fund Assembly held in the library on the afternoon of November 5 (the day he died), and spoke in support of a resolution.

The Academy have petitioned the Queen in Council to grant a supplementary charter instituting an order of honorary retired Academicians and Associates, and on conferring certain other powers for the better government of the Academy. This petition was lodged with the Privy Council in July, and the Academy respectfully waits Her Majesty's gracious pleasure in its consideration.

The Council have to report that, in accordance with the terms of the will of the late James Nasmyth, engineer, of Hammersfield, Penshurst, Kent, the second and final share to the Academy of the residue of his estate, consequent on the death of his widow in October 1893, has now been paid to the Academy as part of his munificent bequest for decayed Scottish artists.

Office-bearers were elected, and the Council were declared for the ensuing year as follows:—Council, Sir George Reid, president; Hugh Cameron, Otto T. Leyde, W. F. Vallance, Robert Alexander, Robert Gibb, William Hole; George Hay, secretary; John Hutchison, treasurer; William Hole and Robert Gibb, auditors; Otto T. Leyde, librarian; Hugh Cameron and W. F. Vallance, curators of library; J. L. Wingate, Robert Gibb, T. Austen Brown and C. Martin Hardie visitors of the life.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE session of the Edinburgh Architectural Association was inaugurated on the 16th inst. by a conversazione held in the Royal Institution. There was a large attendance of ladies and gentlemen, who were received by Mr. W. W. Robertson, president of the Association. The President afterwards delivered an inaugural address. He called attention to an exhibition of fine old engravings of Edinburgh, and especially Edinburgh Castle, which had been made by the late Mr. William Nelson. Passing on, he said his attention had been drawn to the recent addition to the Advocates' Library of the manuscript journal of James Playfair, extending over the period from 1783 to 1793. He had read the journal, and found it to be a plain business record of journeys taken, work done and accounts rendered. A good deal was disclosed that was interesting, glimpses of the habits, the life and the work of the time, but not, on the surface at least, very much of the man. He explained that James Playfair was the father of their William Henry Playfair, and the brother of that Playfair who had been Professor of Natural Philosophy in the University of Edinburgh. To them he was interesting as the father of the distinguished architect of Donaldson's Hospital, of the building in which they were then assembled, and of many others which ornamented the city. He was a Scotsman who had migrated to London and established himself as an architect in Russell Square. Mr. Robertson then quoted freely from the journal, beginning with business entries. Perhaps to them the most interesting part of the journal was the mention of Playfair's journeys to Scotland every year. The names in the record had a pleasant and familiar sound, the 1783-84 visit being explained by the note:—"Was sent for by Lady Glasgow, and likewise went to Raith with Mr. Ferguson on his business and spent a week on his affairs." In successive visits the same names appeared and reappeared—Dalkeith Palace, Melville Castle, Bothwell Castle and others. Evidence of the great industry of the author of the journal and the diversity and prosperity of his work were then cited, the narration being listened to with much interest. At the close of his address Mr. Robertson was, on the motion of Mr. Balfour Paul, accorded a vote of thanks. Afterwards there was an exhibition of lantern pictures, illustrating examples of the Mediæval architecture of France and Britain.

TESSERÆ.

Sculptured Decoration.

ONE can learn a great deal from the Greeks on the subject of decoration, but not by slavish copying. If our work is to be to us as important an element as their sculptural decoration was to them, we must first of all study our own national conditions and needs. One essential difference between Greece and Britain is climate, and consequently light. Our sky is usually grey, and our atmosphere in towns, where important buildings are needed, is often heavily charged with smoke, especially in some of our large manufacturing districts. Therefore the distinctness that is the first essential of all work must be arrived at by different means to those employed in sunnier climes. The fineness of the line in the pediments of the Parthenon, clearly seen perhaps in Greece at a height of 40 feet, but that only by means of colour, could not be seen at all in our climate at the same altitude, unless under exceptional conditions of brightness. As a rule, our work has to be simpler, bigger and bolder, and if, when brought down from the height for which it was designed, it does not bear the close inspection as do the pedimental fragments now in the British Museum, this must be sacrificed for the right effects when seen from below, for this is the one thing requisite. A sculptor in the loving execution of his work is apt, if left alone, to somewhat ignore the required effect dependent upon the position for which the work is destined. Even in some of the Parthenon figures alluded to it is doubtful whether at the altitude of 40 feet, at which they were placed, much must not have been lost. Some of the sitting figures are so modelled that seen from below the knees would cut off the body up to the chest. The Roman work, though not certainly so delicate as the Greek, is considered to have been more designed for a set purpose, and this would be in keeping with the more practical nature of the people.

The Architect as Artist.

The architect is first and last a pictorial artist on a large scale. Indeed, none of the arts, except music and poetry, have the same chances of prolonged effect in design as architecture. The sculptor and painter nowadays are content with their brief but brilliant swallow flights, but the architect's art reveals him to us as the stimulator of men's imaginations by means of large effects extended over a large area. He is a picturesque manipulator of vast forms, he deals with proportional lines, outlines, contrasts, mouldings, masses, bulk, broad sunshine and

deep shade. He is a subtle harmonist of the contending motives of his structure; a colourist who employs colour-artifice in material or pigment, or gets it by glints of light upon delicate tracery and broken wall surface; to say nothing of his employment of the best colouring-matter of all—the essence of his own unique genius. In his capacity of pictorial artist on a large scale he not only uses his own best faculties, but the best faculties of others, much as the musical composer secures the best soloists and the best chorus he can get to form the orchestra that renders his oratorio. And he takes occasion by the hand in using to the best advantage every adventitious circumstance of site or material or natural resource. The best architects of the past have been men in whom the shaping faculty has been highly developed, and though their names may have perished, the loftier masters of design come before us in history as giant forces. The technical power and originality of their design, the beauty of their details, the range of their imaginative flight, all proclaim their work as the finest expression of human intelligence. "Many are the mighty things," says Sophocles, "and nought is more mighty than man." But it is a mistake to suppose that a building is bound to be adorned with sculpture to have imaginative expression. A building is capable of high interest and expression with no aid from sculpture and scarcely any ornament, yet whether severe and naked or never so richly adorned, it is from the architect that it gets its expression. Whether only the skilled mason and carpenter have helped him, or whether he have enlisted the highest instincts of the finest natures, his mind will have anticipated every stroke that is there—the depth of frieze for the painting or sculpture, the niche or pediment for the figure; architecture and decoration will have been sketched by him on his drawings; all will have been seen by the architect before ever the sculptor or painter is called in to exercise his genius.

Raphael's Cartoons.

The associations connected with the original destination of works of art often add to their interest, or at least explain their intention; and it must be admitted that the associations in this case are peculiarly important and striking; it is indeed but doing justice to the painter to be alive to them. The subject of the "Calling of Peter" was immediately next the altar in the Papal Chapel; whoever recollects in the cartoon the deep humility and devotion in the expression and attitude of Peter kneeling in the boat of Christ may now also call to mind that, at the distance of a few paces, the "Head of the Church" contemplated this scene from the highest of earthly thrones. These associations may be easily pursued by comparing the situation and import of the various subjects. The authority, the miraculous powers, the duties and the sacrifices of the Church, the propagation of the faith, persecution, martyrdom—such were the warning and inspiring themes which Raphael selected as objects of contemplation for "the successor of St. Peter." These associations and allusions would only be strikingly apparent when the works were in their original situations; yet among the merits or recommendations of the cartoons may be reckoned their being interesting in all places, and to all classes of Christians. But for this circumstance, perhaps, we should not now possess them, for when the treasures of art collected by Charles I. were sold, and such pictures as were deemed "superstitious" even ordered to be "forthwith burnt" (*Journal of the Commons*, July 23, 1645), the cartoons would hardly have been repurchased by Cromwell, to whom we are indebted for preserving them to the nation, if they could have been considered to come within the proscribed class. With regard to the execution of these works, it is known that Francisco Penni was Raphael's chief assistant. The co-operation of other scholars is also to be recognised, yet in almost all the cartoons the hand of the master is apparent, most perhaps in the "Calling of Peter" (the tapestry from which was to occupy so important a place), and least in the "Paul Preaching at Athens" and "Christ's Charge to Peter." As designs they are universally considered the finest inventions of Raphael. At the time he was commissioned to prepare them, the fame of Michel Angelo's ceiling, in the same chapel they were destined to adorn, was at its height; and Raphael, inspired with a noble emulation, his practice matured by the execution of several frescoes in the Vatican, treated these new subjects with an elevation of style not perhaps equalled in his former efforts. The highest qualities of these works are undoubtedly addressed to the mind, as vivid interpretations of the spirit and letter of Scripture; but, as examples of art, they are the most perfect expression of that general grandeur of treatment in form, composition and drapery which the Italian masters contemplated from the first, as suited to the purposes of religion and the size of the temples destined to receive such works. In the cartoons this greatness of style, not without a due regard to variety of character, pervades every figure, and is so striking in some of the Apostles as to place them on a level with the Prophets of Michel Angelo.

The Gnostics and Christian Arts.

The artistic tendencies of the early Christians were not entirely confined to the dim chambers of the Catacombs. Beyond the limits of the stricter society which adhered to the simple faith and practice of the apostles, there existed in the second century a numerous class of persons who united with profound veneration for the person of Christ, and strong admiration of his teachings, an equal attachment to the speculative doctrines of some pagan school and an unwillingness to renounce the fashionable tastes and pursuits of their time. These were the philosophical believers—Gnostics, as they were then called—whose influence, shading off the abrupt line of separation between pure Christianity and gross heathenism, was far wider and deeper and left more lasting traces on the Church than has been yet perhaps sufficiently acknowledged. These men imported from the lecture-rooms of the popular sophists a great love of art, and especially the reigning passion for collecting the likenesses of eminent sages and philosophers, which admiring students hung up in their chambers and sometimes had embossed on their cups and their seal-rings. Hence, it has been remarked by Heyne, among the remains of ancient art we have so many busts of the chiefs and founders of different philosophical schools. It is not surprising, in the wide prevalence of the syncretistic spirit, that the head of Christ should find a place among those of Orpheus, Homer and Pythagoras. Every one who has read the history of the second century is aware that the Emperor Alexander Severus set up the busts of these eminent personages in his Lararium or private chapel, where he duly offered them mystic rites. The Carpocratians are the first Gnostic sect who are mentioned as having busts or portraits of Christ, which they pretended were derived from an original once possessed by Pilate. The authenticity of the other likenesses associated with it probably rested on no better foundation. Augustine speaks of one Marcellina, a follower of the Carpocratians and a great collector of the images of distinguished men, heathen and Jewish, to whom he ascribes the general introduction of them among Christians.

Mediæval Treatises on Art.

Muratori in his great work on the Middle Ages in Italy has printed a very curious manuscript of the eighth century, the recipes in which give a tolerable picture of the nature of art manufacture among the Greeks at that epoch. It treats principally of the production of glass and contains directions for dyeing skins and making many colours, varnishes, &c. The next manuscript in order of time which has come down to our days is that of Eraclius, "De Artibus Romanorum," written probably previous to the year 1000, and particularly interesting is exhibiting some Byzantine characteristics, mingling with the ghosts of the old arts of the Romans still haunting the site of their old labours and glories. This treatise first proves the existence of the art of mixing colours with oil and of the preparation of canvases, skins or panels, with colours ground in linseed oil for the purpose of the reception of paintings, which were afterwards to be executed in colours ground in the same oil. As the mantle shrank away from the shoulders of the Greeks, it was transferred to those of the Arabs and Saracens, and from the ninth century to the thirteenth their learning in the details of decorative processes in chemistry, geometry and the arts of design generally was perhaps superior to that of any other nation in Europe. It is not, however, to be inferred that because Byzantium and the Mohammedan school bore away the palm, that Italy and the northern countries had been altogether indolent. The arts of ivory-carving, glass-painting and enamelling were introduced at a very early period into France; Ireland and England were celebrated in the seventh and eighth centuries for their goldsmith's work and illuminated books, the former of the two having been then perhaps more venerated and respected than it has ever been since. With the dawning of the eleventh century new life seemed breathed into the world of European art. At that epoch such men as Dunstan, Aldred and Lanfranc in England, Robert in France and Hildebrand at Rome, were encouraging the arts and raising and decorating churches which the reverence for relics caused to be ornamented by sumptuous shrines and costly gates of bronze or silver. The manuscript of Theophilus is the authority for the state of the arts about that time. Who this artist-monk was no one knows, and considerable differences have arisen even among the most learned as to his nationality and the period at which he wrote. Lessing, Leist, Raspe and Emeric David have ascribed to the treatise as early a date as the tenth century; while Guichard, Didron and the Abbé Texier have fixed the twelfth or thirteenth century as the epoch at which he flourished. The work of Theophilus contains a summary of almost all the knowledge of Europe pertaining to the arts of design as far probably as the year 1200. The first book contains in forty "capitula" as many recipes for the preparation and execution of all things necessary for painting in oil, fresco and distemper on wood, tin, mortar and parchment, including the preparation of the colours, varnishes, &c. The second book furnishes us with thirty-one "capitula," giving full and working directions

for the manufacture of white and coloured glasses into cups, vases, windows, &c., and it details the art of painting with enamel colours on glass most elaborately, including the formation of the gold-grounded mosaic, which formed so important an embellishment of all the Italian designs of the period. The third and last division of the *Schedula* introduces us to the whole art of working the precious metals and forming them into all the vessels fit and proper for the service of the church; it treats partially also of the manufacture of iron and gives particulars for the execution of ornaments in niello and enamel; it gives full instructions for the construction of the organ, bells and musical cymbals.

The Lagunes and Venetian Prosperity.

Venice owed the commencement of her prosperity, it may be said her very existence, to the preparation of salt in the surrounding Lagunes, and which her situation at the mouths of the Po, the Brenta and the Adige, enabled her to supply to Milan, Ferrara and the whole of North Italy. In process of time the Venetians seized upon the salt works of their neighbours. Thus the works of Cervia belonged to the city of Bologna, but by a treaty the whole of the salt made there was monopolised by the Venetians, who regulated the quantity to be produced, and even had officers for that purpose upon the spot. In the thirteenth and fourteenth centuries they either possessed or farmed all the salt works on both sides of the Adriatic, at Trapani in Sicily, in the Ionian Islands, Greece, the Levant and the coasts of Africa, and were the sole importers of the salt of the Black Sea and of the Caspian, and even of that collected in the Asiatic steppes. They also succeeded in obtaining the privilege of carrying all the rock salt raised in South Germany, Croatia, Styria, &c., and once forced a king of Hungary to shut up his salt mines. The maritime and fluvial populations of the Adriatic were deprived of the right to export their salt, and those of the north of Italy to use any other; in a word, five-sixths of all the trade in salt of the southern half of Europe was in the hands of the Venetians, whilst that of Northern Europe was monopolised by princes and feudal barons, who charged the most exorbitant price for it—an objection which did not certainly apply to the Venetians, who sold excellent salt at a very moderate price. The sale of foreign salt by any subject of the Republic was punished as a crime against the State; his house was razed, and himself condemned to perpetual banishment. But the Venetian salt monopoly did not end there, for the commerce was carried on by companies, each of which had the privilege of supplying a particular country or district, and none other. We believe it may be asserted with truth that, for fourteen centuries, one-half of the wealth which flowed into that remarkable city was derived from salt.

Concrete.

The discovery of the use of concrete is curious. In excavating for one of the piers of Waterloo Bridge the workmen had a good deal of difficulty, owing to the very compact state of the gravel forming the bed of the river, which everywhere else they had found perfectly loose. This effect had been produced by the accidental sinking of a barge-load of lime over that spot some time before, which had cemented the loose gravel into a solid mass, resembling the calcareous conglomerates of nature which are gradually formed by a similar process. Mr. Rennie having mentioned this circumstance to Sir Robert (then Mr.) Smirke, the latter with great judgment availed himself of the hint and subsequently used it in all his foundations, none of which have ever been known to fail. Part of the Penitentiary at Millbank, begun by another architect in a different manner before Sir Robert Smirke was employed there, was evidently giving way. The superior efficiency of concrete was also proved in a remarkable manner at the new Custom House, where the floor of the large apartment called the Long Room actually fell in and the whole building was in danger, owing to the insufficient manner in which the piling had been originally executed in a very difficult situation. At this period Sir Robert Smirke was consulted, who found it necessary to pull down a small part of the building, but saved the rest of it by undersetting all the walls with concrete, to the average width of 12 feet and to the depth of from 12 feet to 15 feet—that is, until he found a natural bed of gravel, including one course of Yorkshire landing stones and twelve courses of bricks laid in cement, having three offsets or footings between the Yorkshire landings, resting on the concrete and the base of the original walls. No other expedient could possibly have saved this fine edifice from entire demolition. It must be allowed that not only the ancient Romans and after them the Moors, but even the Norman barons of England in their feudal castles used concrete, of which Kendal Castle is one of the most striking examples; and more recently Belidor, in his "Architecture Hydraulique," treats of Béton mortar, which is much the same; so that is not absolutely new. In fact, according to the old proverb there is scarcely anything new under the sun; but the merit of introducing this immense improvement systematically and generally into the modern practice of architecture is undoubtedly due to Sir Robert Smirke.

NOTES AND COMMENTS.

PEOPLE have so long believed that mechanical engineering could be taught only in workshops, it is no wonder there are so few books on the subject. The creation of technical schools has therefore made it necessary that students of practical mechanics should possess manuals in order to be on an equality with students in other departments. The "Text-book of Mechanical Engineering," by Mr. W. T. LINEHAM, of the Goldsmiths' Company's Institute (CHAPMAN & HALL, Limited), exemplifies an effort to make up a deficiency which every day becomes more apparent. It is just such a book as a manager of engineering works would produce, and the moderate price will enable humble apprentices to possess it without sacrifice. It begins with workshop practice rather than with theories of dynamics, and the processes of casting and moulding, pattern-making, smithing and forging, fitting, erecting, &c., are described at length. The second part treats of the principles of machinery. The explanations are clear and exhaustive, and as there are over 700 thoroughly practical illustrations the student must be dense who is unable to comprehend what is said in the pages. The author evidently writes from experience, and he has been enabled to introduce drawings of the latest types of tools and machines belonging to firms of repute. Students who are occupied with building construction will find in the volume information about works in cast-iron and wrought-iron which will be useful to them, and for architects who have sometimes to prepare buildings for machinery it will also be of service. Like all good books, the manual does not appeal to a single class of readers, and it cannot be too widely circulated.

EVERY visitor to Rome is ready to testify that there is marble enough in the buildings to justify the claim which was set up on behalf of AUGUSTUS by his friends. But even students of geology are not acquainted with the varieties which are to be found in the city. To add to the general knowledge on the subject is the object of the handy "History and description of all ancient columns and surface marbles still existing in Rome, with a list of the buildings in which they are found," by the Rev. H. W. PULLEN, M.A., which we hope is the forerunner of many special guides with JOHN MURRAY on the title-page. The labour which the little book needed will be manifest to everyone who has tried to scrutinise the shafts and slabs. The character of the marble is not perceptible at a glance, and it is no wonder that the guide books are so often at variance on the subject. A visitor to Rome with the assistance of Mr. PULLEN'S book can either begin with a consideration of the marbles and goes in quest of them in the places pointed out, or if he prefers to make his itinerary in the way that will be most convenient he will be informed about the marbles in all the buildings he visits. It is only when we are acquainted with the character of the marbles that we can realise the enormous expense which was undergone in conveying many of them from remote regions to embellish Rome. And yet "no one single book on the subject exists in England, and it is just half a century since any such work was published in Italian." Mr. PULLEN'S handbook will enable tourists to find additional interest in the Eternal City.

THE following recommendations of a special committee on the conduct of competitions have been approved at the Convention of the American Institute of Architects:—
 "1. Architects of reputation and experience will not enter competitions unless they are paid for their services. 2. No architect should accept an invitation to enter a competition unless it is distinctly agreed in advance that the author of the best design shall be employed to erect the building, and that he shall be paid for his services at the rates established by the schedule of charges of the profession published by the American Institute of Architects. 3. It is the belief of your committee that the best ends will always be secured by the selection of an architect without a competition, for a better judgment may be formed of the probable result from the past work of an architect than from preliminary studies made in competition. 4. If impossible to appoint an architect directly, and a competition is necessary, we respectfully advise that in making the award it is best to select the man who by his competition

design has given promise of ability to develop his studies into the best solution of the problem, rather than the man who has guessed nearest to the preconceived solution of the problem of the party instituting the competition (thus eliminating as much as possible all elements of chance). 5. It should be clearly understood that a competition can only serve to furnish the general scheme for the arrangement and design, and that much after-study will be necessary to perfect details both of plan, elevations and sections. 6. The number and scale of the drawings required should under all circumstances, be definitely stated, and for any variation from the stipulations the author of the design should be thrown out of the competition. As few drawings as possible should be required, and they should consist only of floor plans, sections and elevations, the latter with carefully constructed shadows. The openings and shadows to be rendered in line, monotone or colour, at the discretion of the competitor, for to the competent expert the plan well studied from an artistic point of view embodies the perspective. The latter tends to discourage serious study, to deceive the jury and to entail a more than useless expense upon the architect, and should be excluded from competitions. 7. Inasmuch as a special technical education is necessary to judge from drawings of the effect in execution of an architectural design, it is indispensable that the party proposing to institute an architectural competition should appoint a professional adviser of standing and experience. 8. It should be the duty of the professional adviser to assist the party proposing to build to prepare a definite and explicit schedule of requirements and to state the exact limit of cost. To fix a definite time and place for the receipt of designs. 9. In the case of competition for work of magnitude, it is recommended that the plan formerly proposed by the Western Association of Architects should be adopted, viz. that a jury of award of three experts should be formed, to consist of the professional adviser of the committee, an architect nominated by the competitors, and a third architect appointed by the two thus selected. 10. It should be the duty of the professional adviser (if no jury is appointed) or of the jury to examine all plans and to place out of competition, by returning his drawings without compensation, any architect who has sent plans not corresponding exactly in number, quality or character with those required by the scheme of competition, or who submits directly or indirectly plans, sketches or models not called for by the scheme of competition. 11. The adviser or jury should study the plans carefully, and should definitely recommend one scheme as giving promise of the best result, and should recommend the appointment of its author as architect for the proposed work."

IT is not surprising that in France the high officials under the Republic should be dissatisfied with the arrangements of their predecessors of the Empire. An opportunity for an expression of that sort was given by the inauguration of the bust of FELIX DUBAN in the Ecole des Beaux-Arts. The architect was about 1849 entrusted with the charge of the Louvre and he carried out some restorations of the buildings. In 1853 he submitted plans for the completion of the palace and the uniting of it with FONTAINE and PERCIER'S work, by which the Louvre and Tuileries would become one great group. As a design by VISCONTI was preferred DUBAN resigned his office. VISCONTI died before the year had elapsed, and the carrying out of his design was entrusted to LEFUEL. At the inauguration of DUBAN'S bust M. JULES COMTE, "directeur des bâtiments civils," was one of the orators. He referred to the resignation of DUBAN as one of those melancholy souvenirs which everybody would like to forget. A Government which could not respect the liberty of an artist was to be pitied, as well as the officials who had the pretension to command a master whose superiority they ought to have revered. The Minister of that time who was incapable to appreciate DUBAN was forgotten, while the architect's name was renowned. French officials are remarkable for the elasticity of their taste, and the question may without offence be asked whether M. JULES COMTE, if he held office in 1853, would not have discovered that by a remarkable coincidence his judgment corresponded with the Emperor's in perceiving the superiority of the Italian's project?

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening. Mr. A. Graham, in the absence of the president, Mr. Penrose, took the chair.

Notes on the Architecture of China.

A paper on this subject by Mr. Gratton, then *en route* for China, was read by Mr. Kidner, who, from his knowledge of China, was able to interpolate interesting and explanatory remarks. It has been often said that China had no architecture, as so few examples of what had existed now remained. Much that had been written about Japan would apply to China, descriptions of feasts and festivals, ceremonies, &c., and casual references to temples. Quaintness and adaptability were the chief charm of architecture in China. Their decorative productions, including carving and sculpture, could hardly be surpassed. Temples of various descriptions abounded everywhere; they were an instance that the minds of the Chinese were saturated with faith with a decided bent towards worship. The amount of money spent for religious buildings and purposes was second to no other country or empire. Their prayers were addressed to an unseen Deity. Side by side with their temples those responsible for imported creeds had erected their places of worship, but the temples erected by these various sectarians could not be called types of national architecture. The Chinese temples were some of them erected in honour of the unseen spirits above, while many were consecrated to agricultural and industrial pursuits. The inability of China to point to architectural remains was accounted for by their destruction by the Moguls, the English, and finally to earthquakes. In the invasion by the Moguls over 100 cities were destroyed. Palaces and temples were destroyed by the English, which work of destruction was helped on by later disturbances. Afterwards no less than 300,000 persons lost their lives by the earthquakes, and, in a similar visitation a few years later, 180,000 persons perished. Among other cities that of Hangchow was alluded to. In the ninth century the city was extended, and 200,000 workmen were engaged on the work and repair of the walls. Timber, owing to the forests, had, and still formed a very general building material. The subject of timber construction, from simple to the most elaborately ornamental forms, would be quite worthy of discussion if time would have allowed them to indulge in it. A geometrical figure to symbolise male and female was described, which had apparently influenced the forms of arches. It was symbolic; but in regard of bridges it involved a considerable height, and necessitated often approaches formed by steps. The Great Wall, winding over hills and mountains for some 1,500 miles, was alluded to, with its square towers, at intervals, some of them two storeys in height. The cities were of four classes. Over 1,000 had embrasured walls, and were frequently flanked with towers. Some have simpler kinds of walling; some had earth or mud walls; others were moated, and had water-gates at the main entrance. The walls of Pekin and two other cities were described as 50 feet high and 40 feet wide; also the concentric walls of Nankin and Canton and Shanghai. Another feature in connection with the cities was the amount of land enclosed within the walls. Whether the large amount of unoccupied space was provided for probable increase of population, or for agricultural purposes for provision of food, or for military purposes, Mr. Gratton did not know. Many of the Taeping cities, with their temples, were now only heaps of ruins; other temples, so-called, were places of business or pleasure resorts. Generally they consisted of three halls, entered one from the other, the third being the largest of all. The most magnificent temples were those in the imperial cities. The roof construction and timber work of these temples was curious. Among the altars was found an altar to the Queen of Heaven. The tilework, the decorations, the stone carvings, including representations of birds, beasts and men, were often marvels of beauty. The celebrated hall of ten thousand ages, once an imperial temple, still retained colour decoration. Bells came in for notice. One 17 feet high, 15 feet in diameter, having 4 inches thickness of metal. A larger one weighed 50,000 lbs., the thickness of metal being 7 inches. The boom of these large bells was some-

thing to be remembered. The writer spoke of images in contradistinction to idols. He had seen no idolatry. In the Buddhist temples there were images innumerable, but in case of fire the images were left to burn, while the costly tables they were placed on were rescued. Of palaces few remained, they had either been looted or destroyed by fire. Pekin Palace was a gem of art, covering an immense area. The hall was 125 feet long and nearly 50 feet wide, the ornamentation most elaborate, and furniture and fittings of the most luxurious kind up to the highest ideal that an eastern mind could conceive. The many charitable institutions for the poor and for orphans, asylums, schools, &c., were referred to, the keeping up of which represented large sums of money from voluntary sources in addition to State aid. Guilds also existed on practical lines, as they used to do in this country. The guilds, however, differed in being amalgamated, all handicrafts of a like kind in one, while those craftsmen who had strayed from their native towns, if strong enough in numbers, formed a separate guild and erected halls for their own use. Allusion was made to the pagodas, towers, pavilions and summer-houses, and some objectionable matters in regard of Chinese infanticide referred to. Canals and rivers form some of the principal highways in China, and the bridges, they were legion. The marble bridge near Pekin had seventeen arches and a handsome marble balustrade. The bridges included also drawbridges and suspension bridges. Generalising, the writer intimated that comfort was unknown in China. If there were fires it was only for purposes of cooking. Chimneys were the exception, and as a rule the fumes of wood or charcoal must escape as best they could. Winter, however, was short, so the absence of fires was not so much felt. In addition, the houses were usually fronted towards the sun, the other three sides of the house being well closed up. The heavy clothing worn by the Chinese was a preservative. They wore clothing layer upon layer till they could not get their arms to their sides. As to windows, glass they scarcely employed it—oiled paper was more usual. Laminæ of oyster shells produced a somewhat subdued but beautiful effect in the way of light. Though a national style might not be now distinctly apparent, what remained showed a beauty in wood, stone and metal work, to which was added a beauty of design in details, mouldings, forms, &c., with also a distinct style in colour decoration, and this was further distinguished by curious neutral but beautiful tints.

Mr. GEORGE AITCHISON, A.R.A., said that, though he knew absolutely nothing about China, he rose to propose a vote of thanks for the paper. He certainly envied Mr. Kidner his opportunities of seeing the beautiful colour decoration in China.

Sir HENRY HOWORTH expressed the interest with which he had listened to descriptions of districts so long familiar to him. He had only lately said, while presiding over a meeting of the Archaeological Institute, that something could often be learnt from what they might call uncounted buildings. Bamboo architecture in tropical regions was very suitable; deep shade and plenty of draught was obtained, and white ants would have nothing to do with bamboo. Architecture in its changes was influenced by contact with other civilisations, and the East had not failed to take inspiration from the West. He also instanced how the Chinese had valued the superior knowledge in astronomical science, imparted to them by the Jesuit Fathers. He traced the introduction of the manufacture of the beautiful coloured porcelain in China to the Persians. The Chinese, with their wonderful aptitude, had at once set out to work out the capabilities set before them. He was quite of opinion that Chinese art had come from the West, and in their pagodas the construction was exactly Babylonian.

Mr. R. PHENÉ SPIERS said he had been struck with the resemblance of the Chinese work to Chaldean and Babylonian architecture. The area of the city of Babylon was so immense that it was natural to imagine much land had been reserved for agricultural purposes in case of siege. He doubted whether the Chinese could claim to have a style, properly so-called. Their architecture showed no knowledge of furnishing capitals for their columns. In constructing arches they had followed the Babylonians.

Mr. ASHBEE said that the marvellous architecture of China—a most remarkable country—would admit of much explanation that they probably had not time that evening to enter on. Speaking of Pekin, he said it contained four cities; the inner contained the imperial palace and gardens, the second the villas of the nobility, a third zone was devoted to the military, and the fourth and outer zone made the Chinese city.

A hearty vote of thanks was passed for the paper and the proceedings terminated.

Mr. Riley, of Halifax, has been appointed surveyor by the Gainsborough Local Board, a post vacated by Mr. MacDonald, who has received an appointment at Rugby. There were 133 applicants.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE opening meeting of the Northern Architectural Association was held on the 14th inst., when an address was delivered by the president, Mr. Joseph Oswald. Among the local topics treated were the following:—

The architectural aspect of our city must always be a matter of prime concern to us, and so I cannot refrain from referring to a matter which my predecessor touched upon last year. I mean the way in which our streets and buildings are defaced by advertisements, enormous letters and signs attached to or surrounding the façades of our buildings, with entire disregard to their structural lines. To my mind, nothing more vulgar can be conceived than the mania for advertising running riot in such shapes. They are a standing menace, too, to public safety, for, in course of time, the probable neglect of these features, accompanied by inevitable corrosion and decay, may result in serious accidents. I am far from advocating too much interference by public authorities with the liberty of the subject, or with the ownership of private property, but I do think these authorities occasionally strain at gnats and swallow camels in a remarkably inconsistent way. Not only in towns is this disfacement going on, but the traveller by rail or road must needs have his sensibilities shocked by "execrable shapes" which rear their "miscreated fronts athwart his way." I allude to the boards stuck up by the advertising fiend in quiet country lanes and fields, extolling the merits of this, that, and the other condiment, medicine, or substance obtained by the action of caustic alkalies upon fats. Cleanliness may be next to godliness. Soap is, no doubt, an important factor towards that result; but if its use has to be secured at the expense of our landscapes, so much the worse for our age and generation. And not only by day are these things forced upon us, but even when night has fallen our buildings, no matter how sacred or stately, are threatened by a new development of the craze. By means of limelights and lenses, the praises of anybody's manufactures can be projected across the dome of St. Paul's, and I believe actually have been upon the buildings surrounding Trafalgar Square.

As architects, we might do something to curb the use of objectionable signs, by providing upon our elevations panels or spaces where letters and the like can be inserted or attached. The architect too often overlooks the fact that such things are necessary, and in their proper place legitimate; and if he covers every superficial foot of his building, that is not plate-glass, with architectural detail, he tempts the owner or tenant (as a rule, a modern Gallio who cares for none of these things) to eclipse the mouldings and the carving however refined with things never contemplated by the architect's academic rules. This leads me on to a word or two upon restraint in design.

Axwell Park is not a very remarkable building (its architect was Mr. Payne, of London, who enjoyed a considerable practice in the North of England, for he also designed Belford, North Gosforth and Bywell Halls), but it exemplifies what I call restraint. "It stands four-square to all the winds that blow," and possesses dignity due to simplicity of form, which we lose if we fritter away our resources on small scale details, or by constructing picturesqueness. Such faults are not confined to one city or neighbourhood. It is general. Ever since the days when Barry overlaid his greatest work with an exuberance of surface ornament, it has been the fashion to follow in that track. Now, I am glad to see signs that the tide is setting in another direction, and that the value of plain wall surfaces is being more and more appreciated. The success of one work of the past few years is clearly due to this. "New Scotland Yard," on the Thames Embankment, by Mr. Norman Shaw, appears to me a brilliant example of genuine architectural effect, legitimately obtained. Of course, we in the provinces rarely have free scope. We can do little else than reflect the public taste of our respective localities. Lead it we may so far, but so far only, for if we get too much in front we lose our following.

Every owner, I presume, of every little twenty-foot frontage in a business street wants to make the most of it, something quite different from, and always taller (if he can manage it) than his neighbour on either side. So the architecture of our modern streets becomes a heterogeneous mixture of narrow vertical slices; whereas one has but to look at Grey Street, and the old part of Grainger Street, to see that horizontal combinations only can give real dignity to the whole. And yet, the streets I have named are free from monotony. If we go into the suburbs we will see row upon row of houses, as like to each other as peas in a pod.

I never saw a town of the size and wealth of Newcastle with so little beauty in its suburban streets. Of course architects are not to blame for this, or at any rate, very remotely. These houses are run up, half a dozen at a time, by speculators, who build to sell. But if we cannot practise we may, at any rate, preach. One of the great difficulties in securing a more lovely state of things lies in the system of back streets, which obtains in this city. Why should these be omnipresent or so un-

pleasantly obtrusive? In many towns you may look far to find them. Instead, you will see semi-detached villas, with gardens where our back streets would be. Each block being separate from its neighbours, there is scope for individual treatment architecturally, and sanitarily there is better circulation of air. The cost need not be greater, for although more frontage is called for, and more external walling, there is no back street to swallow up land, to pave, to flag, to sewer, to scavenge, to watch, to light. Let us hope that in some of the building estates about to be laid out in the neighbourhood an attempt will be made to get out of the groove into which we, in the north, have fallen, and to provide modest but attractive detached or semi-detached dwellings, not too large or expensive for the average family. Years ago (and from time to time since) correspondence on this subject took place in the local newspapers, but as yet its ventilation has brought no tangible result. A word, too, in condemnation of the dog-in-the-manger like way in which some people hem in their grounds and gardens by high walls, converting semi-rural roads or lanes into avenues of brick and stone, instead of verdure.

Newcastle is not rich in architectural interiors. A year or two ago we lost the Central Exchange, a very noble apartment. This year we have, to a large extent, lost the interior of the Central Station. Our first President's great work, with its subtle charm arising from the harmonious blending of curved plan with curved roof-lines, and the archivolts of its openings, has been irreparably marred as a work of art. There has been a gain in accommodation (and, therefore, possibly in convenience); but I confess that I cannot look without depression upon the low sheds that have been tacked on to the east end of the station, and upon some other features that have been introduced into it. Another railway work now nearly completed we may, on the other hand, be grateful for. I mean the Dean Street arch. "It might have been" a girder bridge; but, "greatly to its credit," the railway company has built a granite one, the curve of which, though not concentric with the older arch alongside (which was impossible), still harmonises with it, and one of the most striking "street-scapes" in Newcastle is thus preserved.

A short time ago the news came with a shock to most citizens that the lantern of the tower of our cathedral church of St. Nicholas was in a dangerous condition. Its restoration, under Sir Gilbert Scott, a quarter of a century ago, was deemed to be effectual for a much longer period than has actually proved to be the case. Our smoke and acid-laden atmosphere, combined with want of attention to ironwork and pointing, has brought about a state of things which all must deplore. It is to be hoped that no time will be lost in making this world-famed structure again sound and substantial beyond the risk of accident, and that no considerations of precedence or parsimony will restrain our City Fathers from doing what is necessary. No question of churchwardenship *versus* municipality should be allowed to arise now. The treasure the city possesses in this steeple is unique. It has been imitated, but never copied. Even the greatest English architect of the last 200 years, who rivalled Michel Angelo's dome, never raised aloft another lantern like ours. There is a tradition that Wren, when the centering was removed from his church of St. Dunstan in the East, watched the operation from London Bridge, apprehensive of the safety of that weak aftertype of the lantern which here, in Newcastle, has for centuries upreared its stately crown, and which we are bound to preserve for the admiration of the centuries that follow.

I well remember when, in 1867, the dome over the south-east corner of the Central Exchange was destroyed by fire, the owner, when rebuilding, proposed to omit it altogether. The importance of the dome to the *tout ensemble* of Grey Street was felt to be such that a public subscription was instituted by the late Alderman Dodds (chairman at that time of the town improvement committee) to defray the cost, and so the integrity of the design was preserved. How still more important to the architectural repute of the city is the tower of St. Nicholas?

It has been publicly announced that the Theatre Royal, one of the city's finest buildings, designed by Benjamin Green, the exterior after the Pantheon at Rome, is so far as the auditorium is concerned to be reconstructed within the next twelve months. Whether such internal reconstruction will be architecturally an improvement remains to be seen; but, so far as I know, it has not transpired to what extent, if any, the façade in Grey Street will be interfered with. I may, however, express the hope that the proprietors will regard themselves as trustees of a noble work of art, and, as such, guard it from any injury.

Another work of Green's has undergone internal reconstruction lately. I mean the library of the Literary and Philosophic Society. The ceiling, as Green left it, was a piece of good design, unpierced, cambered and coffered, and its removal a few years ago, when top light became a necessity, was a distinct loss; but this year much has been retrieved in carrying out the design of our past president, Mr. Rich.

It must be a matter of congratulation to all British architects and archaeologists, and to us in Northumberland especially, that the ownership of one of our most precious relics of antiquity, in changing hands this year, has become vested in a nobleman who is not only able to appreciate, but able and willing, substantially, to prove his appreciation of all that is beautiful and interesting in his latest acquisition. Lord Armstrong and his architect have before them a delightful task in enhancing the natural and artificial beauties of Bamburgh Castle, in the removal of what is base and unworthy of its age and grandeur, and the replacement of much that less erudite workers have, in their ignorance, destroyed.

The building trades in this district during the past year have been and promise to remain fairly brisk; perhaps because they have not for some time past been disturbed, like some other trades on Tyneside, by disastrous strikes. Long may they continue to be free from them. I was informed a few weeks ago that, in connection with one important branch, a Conciliation Board had lately been formed in this district and was working so far harmoniously. If such boards were generally established they would go far to allay the jealousies and distrust which lie at the root of all trades disputes; and if decisions arrived at by them were always loyally acquiesced in by those concerned we should be appreciably nearer the millennium.

The relationship between the local master-builders and our profession continues satisfactory; a pleasing contrast to the condition of affairs in one other important centre, where disputes appear to have arisen difficult of settlement, unless mutual respect, confidence and forbearance, such as obtain here, unite to smooth them over.

Closely bound up with trade organisation is the question of apprenticeship, the decadence of which system calls urgently for some remedy or substitute. Although we are not yet in this country so badly off in this respect as seems to be the case in the United States of America (owing to the control there of trade matters being practically in the hands of foreign immigrants), we are nevertheless in the unfortunate position of witnessing the gradual but inevitable extinction of the old style of things, where the relations between master and apprentice were pre-eminently personal. What is to take its place? Will the modern technical school be able to cope with the problem. I doubt it; but to attempt to deal with the situation and to review the whole subject of building trade organisation with its infinite ramifications would take a paper itself, nay, a series of papers, only to enter into, and I feel that I am getting far beyond the proper limits of an address such as this.

GLASGOW ARCHÆOLOGICAL SOCIETY.

THE thirty-eighth annual meeting of the members of the Glasgow Archæological Society was held on the 15th inst, under the presidency of Professor Ferguson.

The secretary, Mr. W. G. Black, submitted the annual report. This stated that the number of members admitted in 1893-94 was thirteen, and that the total membership, including honorary members, was now 342. Professor Ferguson moved the adoption of the report, Mr. John Honeyman seconded, and the motion was agreed to.

Professor Ferguson then delivered his retiring address. He said that when he came into office a year ago, he referred to the necessity not only of individual students, but even of societies, confining themselves to such topics of investigation as lay closest to their hands. For themselves, it was not requisite to go from home for material to examine. The field of research in Scotland alone was far from being exhausted. The country teemed with reminders of the forgotten past. It would be a work of much value, but of no small labour, to give a survey of all that had been done during the last two or three years to illustrate the antiquities of Scotland by individuals and the half-dozen or more of Scottish antiquarian societies. There had been a broadening of the subject for a little time. A danger to which all remains of antiquity were exposed was the ignorance of those who lived beside them. It was well that knowledge of the antiquities about us should be as widespread as possible. It was only by educating a universal public interest in the preservation of objects of antiquity that they could be protected from the selfishness of individuals and the iconoclasm of certain classes of people, railway companies and others. Let it once be understood thoroughly that a castle, hill, fort, or monument, although it might be claimed as property by an individual, yet as an antiquarian object belonged to the country at large, and a great deal would have been achieved. In Glasgow it would be well if the Archæological Society carefully watched alterations which might be suggested hereafter. There was hardly anything left of early Glasgow, and what little there was should now be jealously guarded. The most important archæological event of the year was the Old Glasgow exhibition. In every respect it was most valuable.

In the first place it brought to light an abundance of objects of all sorts which had outlasted their actual use, and were kept in existence as mementoes of their owners or reminders of different manners and conditions of life, or for the worth of the material of which they were fashioned. One was glad to think that so much had survived when the temptation was so great to discard old things to make way for new. One might try to hope, but he feared they could hardly believe, that the exhibition had sufficiently impressed the inhabitants of the city to make them take a greater interest in its past history and in the people who lived in it and helped to build it up. But if it had induced them to preserve anything, however trifling, which threw light on the history and manners of the past, the exhibition would not have been in vain. A great danger to objects of antiquity was their isolation, because it was only by comparison with other objects that their value could be ascertained. In his address last year he had alluded to the importance of establishing an archæological museum for Glasgow. The recent exhibition had come most unexpectedly to take up by direct illustration what he then said. It had shown that there was no lack of material as a nucleus for such a collection. He believed that many persons who had objects of curiosity and value would be pleased to have them safely housed and preserved in a regular Old Glasgow Museum. He hoped that it would be within the power of some one who occupied the presidential chair to do something to bring to a practical issue the design for a permanent Old Glasgow exhibition. In concluding he paid a sympathetic tribute to the memory of two members, Mr. Guthrie Smith and Professor Veitch, who had died during the year. He afterwards nominated Mr. C. D. Donald as the new president. This motion was unanimously accepted.

Mr. C. D. Donald then took the chair and delivered his opening address. He devoted his remarks to a consideration of the benefits of archæological research. In every one, he said, there was a spark of diviner fire which the ordinary pursuits of business life did not satisfy. A knowledge of the past and an interest in it the archæologist carried with him wherever he went. To him no journey could be dull or profitless, for everywhere there were to be found traces and remains of the past ages that showed to us the manner of men those were who lived and loved and fought and died in the far-off years. It was this human interest which gave life and glow to archæology. His advice to everyone who wanted a hobby was to choose archæology. Its study was excellent training for a man's observation, for his power of recognising a fact and its consequence, and for its judgment. He suggested as a suitable subject for archæological research the so-called Caledonian wall. It might lead to the settlement once and for all of the question whether it was a prehistoric rampart or a modern fence. He further suggested that a catalogue should be made of the various objects of antiquarian interest within a certain radius of Glasgow, say ten, fifteen, or twenty miles. If a combined effort were made such a catalogue would soon be under way. Other office-bearers were afterwards appointed, and the proceedings terminated.

EXHIBITION OF PHOTOGRAPHY.

THE executive council of the Imperial Institute have announced that a special exhibition of photography in its application to the arts, sciences and industries will be held at the Imperial Institute, in connection with the United Kingdom section, during the summer season of 1895. An influential committee of advice has been formed, composed of governors of the Imperial Institute and scientific men of well-known standing who are interested in photography; and sub-committees have been appointed in connection with the seven sections of the exhibition, viz.:

Division 1.—The history of photography, including illustrations of early processes, the progressive development of processes, the early processes of photo-mechanical work and modern photographic literature.

Division 2.—Artistic photography, comprising a thoroughly representative exhibition of all schools, embracing known as well as new works, and illustrations of the present condition of photographic art in the various colonies and in India.

Division 3.—Photography as an industry, demonstrating the apparatus used in photography and the special processes connected with the preparation of lenses, the production of brass fittings, cameras, &c., shown in actual operation; the preparation of dry plates, coating of sensitive media, printing processes, also shown in actual operation; reproduction of pictures and the production of portraits by daylight and artificial light.

Division 4.—Photography in its applications to industries, such as reproductions having photography as their basis, as applied to illustrated journalism, literature, &c., and industrial applications of photography to ornamentation.

Division 5.—Applications of photography to the sciences, including orthochromatics, optics, stereoscopy, photomicro-

graphy, spectroscopy, meteorology, and magnetism, astronomy, automatic recording apparatus, &c.

Division 6.—Applications of photography to educational purposes.

Division 7.—Miscellaneous applications of photography, including applications of photography to architecture and archæology, to engineering, to military and naval purposes, to legal purposes (such as the detection of forgeries), to surveying, cartography, chronography, &c.

Notification of the exhibition will shortly be transmitted to the principal firms engaged in the manufacture of apparatus connected with photography in the United Kingdom. The Governor-General of India, the Governor-General of the Dominion of Canada, and the Governors of the various colonies have, by a recent mail, been requested to invite Indian and colonial manufacturers to exhibit.

VANDALISM IN ENGLISH CHURCHES.

A CORRESPONDENT of the *Times*, under the signature of "Vacuus Viator," having lately complained about the difficulty of admission to country churches for the purposes of study, some letters in reply have been published. Mr. Albert Hartshorne writes:—

Does experience show that the people can be trusted in this respect? I instance the forlorn and denuded condition of the ancient memorials in Westminster Abbey generally, and the monument of Henry III. in particular—though for centuries under vigilant care—in absolute proof that it cannot. I say nothing of the missing or shattered artistic details in countless churches throughout the kingdom.

What said Sir Roger de Coverley in 1712, on being told that the silver head of Henry V. had been stolen from his effigy? "Some Whig, I'll warrant you; you ought to lock up your kings better; they will carry off the body too if you don't take care."

The late Sir Gilbert Scott tells a story, in his "Gleanings," how he once discovered in the Abbey some beautiful alabaster statuettes belonging to the tomb of Queen Philippa; these he fixed in their original positions with his own hands; on his next visit he found they had been stolen, and he figuratively suggests "the 'tanning' of the rascal's 'hide,'" somewhat after the Mediæval manner, as fitting punishment for the thief.

"Nay, let hym alone; he lieth lyke a nobyll Prince, I wolle not troble hym," said Henry VI., when he was choosing a site for his own grave near that of his father; but no such piety has troubled the people for centuries, and it is, unfortunately, no new British characteristic that works of art in churches should be stolen, disturbed, or destroyed.

The brasses in Cobham Church, of which "Vacuus Viator" (the correspondent) could not get a sight on a Sunday afternoon, form the finest series in England, and, together with the armets and helmets over the tombs, are worthy subjects for the special care that is and must be taken of them from day to day. It will probably be urged that behaviour is improving, and that a proper sign of our confidence in the people would be to leave the churches constantly open. Such was, indeed, the feeling with regard to one of the finest old churches in North Northamptonshire. I give this as a typical case. Four days ago the rector wrote to tell me that four beautifully-carved little wooden figures decorating the lectern were stolen last week. Such a thing would probably have been impossible in Italy, and would not have happened in this Northamptonshire church if the doors had been locked, as they now probably will be in future. It was found impossible to keep open during the week the great church of a small town near here because workmen and market people retired within its portals, not to pray, or to steal, or to do damage, but to eat their dinner. Again, such would not have been the case in Italy. The ancient church here (Ashbourne) is safely open both day and night, having been "restored" with unusual thoroughness about forty years ago.

It is to be hoped that custodians of cathedrals and churches will continue to take the measures which experience has shown them to be necessary in order to resist the shocking British habit of damaging or carrying off the works of the great artistic ages which have passed away; measures, indeed, which are clearly necessary to save what, after all, is now but a remnant. It may be that a better spirit may arise among the masses. In the meantime it seems to be the melancholy truth that the few must continue to suffer inconvenience or exclusion on account of the wantonness of the many, if remains of ancient art are to be preserved at all in English churches.

The Rev. F. T. Bramston, vicar of Wootton Wawen, says:—Such a visitor as "Vacuus Viator" to any church would, of course, enjoy from any clergyman more than a welcome. It must be the exception rather than the rule that he meets with now and then an obstacle in the path of his instructive and interesting studies. But he will agree that some care and that some rules are required. The whole sanctuary might be open day and night if all were as "Vacuus Viator." Even in this

remote place a party came on an occasion and had a picnic in the church, leaving one of the party, a woman, intoxicated, and traces are easily recognised about this old church of the spoiler's hand—monuments defaced with names which are witnesses to their owners' disgrace and otherwise injured. I determined on coming here to keep the church closed, and to make the charge of 6*d.* for each person wishing to see the church at any other time than when it is open for Divine service. The amount charged goes towards the church and is entered regularly in a book; all this is done with the approbation of the two churchwardens.

Another correspondent writes:—I sympathise with "Vacuus Viator" in his various disappointments. Like him, I take a deep interest in Ecclesiastical architecture, and I have long practised his intelligent method of travelling—a method by which I have managed to see nearly all the great churches in England. But I do not sympathise with his random denunciation of deans and chapters and "casual parsons," and I think his grievance is not with them, but with that great number of the British public which renders necessary the existence of these "arbitrary restrictions."

Unfortunately there does exist, I had almost said a majority of people whose unrestricted admission into churches and cathedrals would be followed by the gravest evils. It was not long ago that an English clergyman (and I will willingly allow "Vacuus Viator" to call him a "casual parson" or anything he likes) was convicted of chipping a piece off a piscina in Westminster Abbey which he desired as a memento. And how many there are who, if not "personally conducted round Canterbury Cathedral," would scratch their names on the nose of an alabaster effigy or anywhere else that offered a good surface. And the spoliation by which matrices alone remain of the finest brasses throughout the country took place "before deans and chapters introduced their so-called reforms and charged 6*d.* a head."

But I do not believe that deans and chapters and casual parsons ever desire their restrictions to exclude any one who really takes a deep interest in architecture. I have never been refused permission to have access at any reasonable time to a church in order to take brass rubbings. I have found the Dean of Canterbury, to take "Vacuus Viator's" own instance, most ready to give permission to a total stranger to dispense with "personal conduct" in the cathedral.

Lastly, I cannot agree with his admiration of the French system of State control. The place where I saw it most elaborated was at Mont St. Michel, and there one was personally conducted, at a great pace, with no dawdling or straying allowed anywhere, and with no possibility of an appeal to any one for relaxation of the rules. Bureaucratism is worse than the most casual parson.

ARCHITECTURAL EDUCATION IN AMERICA.

THE following report was presented at the Twenty-eighth Convention of the American Institute of Architects, held in Chicago on October 15, by Mr. Henry Van Brunt, chairman:—

The committee on education, on account of the wide separation of its members, has found it impracticable, either in person or by correspondence, to consult together with that freedom which is demanded by the increasing importance and difficulty of the subject committed to them. But the present condition and future prospects of architecture seem at this moment to be so peculiarly dependent upon the character of the training in the professional schools of the country, that your committee venture to present for your consideration a brief and necessarily unstudied statement of the architectural situation, with an inquiry as to the possibility of improving it through a modification of our educational methods.

This statement is made not with the expectation of revealing any new thing, but rather to formulate in a more or less definite way a condition of things which, without any such formulation, is apt to remain without clear recognition, and the suggestion for improvement is offered, less with the expectation of laying before you a practical scheme for reform, than of stimulating inquiry and awakening discussion.

We consider that the present condition of architecture in this country as a fine art, though there are clear indications of a late advance in academic scholarships and in technique generally, is unsatisfactory, because in this advance there cannot be detected any healthy progressive principle. In fact, it is rather a progress of personal enterprise and skill than of principles, and does not seem to promise any large or characteristically national fulfilment. It is made on irregular skirmishing lines, not without evidence of individual gallantry here and there, but with none of that effective unity of effort which is the only means of achieving results adequate and proper to our especial civilisation.

As architecture is now for the first time in the hands of men of education, it becomes very important indeed for us to consider whether this education cannot be such as to inculcate

convictions, to make our young architects the agents of a far more definite and orderly progress, and to inspire them with a certain definite consciousness of duty in respect to the development of a system of architectural forms, less conventional in character and more accurately adjusted to the expression of our new life.

But it is said, "Let us be content to do our duty to our art and to our clients, each one to the best of his ability and according to his best lights, and let the style of our time take care of itself, as the styles of former ages and peoples have been created. For these historical styles have developed themselves out of the political, religious, commercial, ethnological and social conditions, and technique has varied with variations in materials and methods. Why should we attempt to interfere with this natural automatic process of evolution?"

In answer to this question is involved a statement of the difference in the conditions of practice in ancient and modern times. But it seems hardly necessary to repeat this statement before such an audience as this, and to say again that our past is a far larger region, a far greater inheritance than belonged to any of our predecessors, and that our minds are preoccupied and our ideas complicated by an infinite variety of architectural monuments.

The progress of investigation in archaeology has made us familiar with the buildings and arts of every age and race; we have classified and defined the styles; we have theorised infinitely and created a science of æsthetics. We can, therefore, no longer be, like our predecessors, unconscious ministers in the development of style. As our resources have been infinitely expanded, our personal responsibilities to our art have become far greater and our task far more difficult. Architecture has thus necessarily become a learned profession and we cannot do our duty without academies, libraries and museums, and a large equipment of photographs and prints. The architects of the great historical eras, dealing with comparatively simple problems and with only one set of forms at a time, were enabled to concentrate their forces, to develop style without affectations and with infinitely less consciousness of effort than ourselves, who are distracted by our knowledge and perplexed by our exacting reminiscences. These conditions have introduced a new element into the practice of architecture, an element of self-consciousness, of dilettanteism and imitation, which have sophisticated modern architectural manifestations and deprived them of that sincerity, power and simplicity which can result only from concentration of intelligent effort and from strong convictions based, not upon the traditions of the studios, but upon a philosophical analysis of our vast resources of design.

Without presuming to criticise the methods of instruction in our schools of architecture as at present conducted, and certainly with a grateful appreciation of what their professors and teachers have already accomplished in the service of a purer and nobler art, we would ask them to systematise and co-ordinate the study of all the historic styles, as they were successively developed in their progress from picturesque barbarism to the elegance and refinement of the higher civilisations; to make this study an essential part of the curriculum of the schools; to teach the outlines of history by the architecture which was a part of it; not to select certain of the styles for exclusive study, leaving what seems the less interesting and beautiful, the less highly organised or less applicable to our use, to be picked up by chance, if at all. Our project would be to pursue this study of history through its manifestations in architecture from archaic to modern times, or, at least, to the nineteenth century, not with the minute patient scrutiny of the archæologist, but with the spirit of the artist seeking to learn how forms and ornament were developed out of the genius of civilisations and peoples and how, as they were significant of the progress of human culture in the past, they should be used in the service of modern art.

We recognise that the best discipline of the faculties of design can be obtained only by especial and continued practice with the most highly organised of all these styles, and that Classic art must continue to be the means, but not the end of this discipline.

We believe that this organised study of the historical styles would prevent the graduates of our schools from becoming mere spendthrifts with their inheritance, and that with this new knowledge, apparently never before taught, they would learn to be tolerant. "Savoir c'est pardonner." They would practice not with unreasoning prejudice in favour of this, that or the other forms of art, nor with the indifference of eclecticism, but with a sense of the deep significance of these forms, to whatever era they belonged, as expressions of the history of our race, and with a conviction that decorative forms in historical architecture are not mere fashions or accidents of the times, nor mere independent isolated phenomena, but symbols slowly evolved by processes of art from certain definite conditions of human life, as links in a continuous chain of evolution, as genuine and serious manifestations of art, however rude.

Would not this larger comprehension thus obtained of the significance of ancient decorative forms and this increased

respect for them as means of expression have an immediate effect upon their adjustment to modern uses, and ultimately upon the development of contemporary style? Would they not be used with more intelligence and feeling? Would not our young architects be less subject to undisciplined caprice on the one hand, or to academical prejudice on the other? Would they not become in the best sense catholic and more worthy to inherit the inexhaustible wealth of the past? Would they not above all, perhaps, be freed from the mean virtue of conformity or archæological accuracy, which has done more to retard the progress of architecture as a fine art than any other influence except ignorance and pretence?

There can be no doubt that as the true basis of architectural composition of the highest sort is to proportion and to decorate structure, and that as structure is constantly developing with new methods, new devices of engineering and new materials, the architecture of the immediate future must necessarily assume a new character, at least in its outlines, supplanting to a great extent those Classic or romantic ideals or standards which custom has arbitrarily imposed upon modern practice. Are our present methods of education preparing our young men to accept these inevitable changes without a wasteful and futile effort to effect a reconciliation between ancient academic prejudices and these new things? Will the architecture of our country in the next decade express in no doubtful terms the civilisation of America in its best estate? For this difficult task do we not need a much more scientific co-ordination of precedent, a much more philosophic analysis of the architecture of the past than is secured by our present methods of education? The question evidently is, not how are we to effect a compromise between engineering and architecture, but how are we to convert engineering into architecture, how are we to use the immense resources of beautiful precedent at our command in order to translate this prose into the poetry of a high art? The language of form, made accessible to us by a system of study such as we propose, would be as copious as the language of words at the command of Tennyson and Browning, of Longfellow and Lowell. The vast vocabulary of these great masters, these "builders of the lofty rhyme," is made up of words and phrases derived from the entire experience of mankind, not from any especial era or from any selection approved by any school or academy of learning. They could not have expressed their inspirations with any such arbitrary or scholastic limitations of terms. The duties and the privileges of the modern architect in respect to his art are the same as those of the modern poet in respect to literature, but the prejudices of the architect's education have, by exclusions of language, apparently entirely artificial and unnecessary, embarrassed his efforts to express in terms of art the exigencies of modern structure, material and use. He is still trying to write new songs and sonnets and epics in Classic Latin or Mediæval French, and is still wondering that no one but himself comprehends or enjoys them. We are conscious that this analogy between literature and architecture must not be pushed too far, for the two arts have very different messages to deliver to the intelligence of mankind. Architecture of course can express emotions and thought only indirectly by symbols. But the analogy is close enough to support and illustrate our argument.

If the American Institute of Architects should succeed in persuading the schools of architecture throughout the country to teach the whole course of history by architecture, and should open to them the whole series of historic forms in the order of their evolution without prejudice, the genius of the more spacious times in which we live, which are the culmination and the result of all that has gone before, would stand a much better chance for adequate expression. Let the schools teach our young men not to conceal or disguise or condone in a mask of cold convention the inevitable changes of form which must come in process of time with the changes in our social and economic conditions, but to welcome them frankly and express them, not with quotations from other tongues, not with the affectations and pedantries of academical learning, but with the large freedom derived from a comprehensive knowledge of all that has been done or said in forms of art by all peoples.

It seems to us that it is only by some such process as this that architecture as a fine art can keep pace with science. We are not proposing any such folly as the deliberate invention of a new style or any possible amalgam of old styles, but we are inquiring whether it is not practicable by an analytic study of precedent, without arbitrary preferences, to apply to the art of our times a synthetic method of evolution. Our art should be an art of scholars and artists, not of antiquarians, nor of amateurs, nor of pretenders. They should be instructed and inspired by the past, not controlled by it. As viewed from a philosophical standpoint, do not our present methods, without such a comparative study of form as this, open us fairly to the charge of empiricism?

If we may not in this way accomplish a revolution in the architecture of our time (we do not desire a revolution, but a reform), we may at least give to the architects of the next decade a far wider point of view and a far deeper understand-

ing of their functions and responsibilities in an evolution of style which, if it is not directed, will continue to be lost in fruitless and disorderly experiments.

When we see members of the Institute, men of the highest available professional training, repeating at the same times and in the same places châteaux of Francis I., town halls of Henry IV., Italian villas of the cinque-cento, palaces of Palladio, decorating casinos and theatres with every form of Arabian or Saracenic art, building libraries in southern Romanesque, country houses like the farms of Normandy, churches like those of Edward IV. or St. Louis, dwellings after those of every era of English history, public structures in every form of the Renaissance—when we see them dissipating their forces in these barren revivals, each one according to his fancy, we may well doubt if this is the best possible use of our knowledge of precedent. Can the discipline of our schools produce no better result than this confusion of tongues? Is it not time for us to consider how we can work together with profitable unity of effort, each aiding the other? Does not the inevitable modern accent which may be detected in all these attempts to speak ancient languages prove that characteristic modern style is possible, and is only restrained from its full and natural development by the prejudices of our education? If the secret of rational progress does not lie in a more scientific and thorough method of studying the styles and the historical conditions from which they grew, to the end that we may use them not as mere imitators and revivalists, but as artists and creators, where else shall we seek for a remedy?

The new type born of such a study must necessarily be infinitely richer, more elastic, more various than any of those which lie behind it; it must include all their virtues and none of their vices. It would substitute a true vernacular for one which is spurious and vulgar. Architectural effort united upon such a type as this would not imply a uniformity which would soon become wearisome and monotonous. It would rather imply variety and unity, effective concentration of power, and such a concentration means logical and consistent progress. Such a progress with our present methods surely we are not achieving.

Hitherto, it must be sadly confessed, we have treated our great resources, if not like undisciplined barbarians with the spoils of war, certainly more like the arbiters of Parisian fashions than like artists and scholars. The new education, far less pedantic and far more cosmopolitan and generous than the old, and also far more discriminating, must teach us the real value and meaning of our inheritance, and how to use it with a full appreciation of our responsibility to art and to the civilisation of our time.

ITALIAN ART.

AT the opening meeting of the Architectural Section of the Glasgow Philosophical Society on Monday, Mr. T. L. Watson, architect, read a paper on "Glimpses of Four Great Periods of Italian Art." The four periods referred to were:—(1) That of ancient Rome, (2) the Byzantine period, (3) the Middle Ages, and (4) the Renaissance. The lecturer dealt chiefly with the art of the Middle Ages, and pointed out some of the varieties of Gothic architecture that prevailed in the different divisions of the country. The influence of the classical art of antiquity was felt throughout the whole Gothic period, and was seen in the general effect of breadth, in the horizontal treatment and the flat surfaces as opposed to the vertical treatment and the deeply-recessed openings and mouldings of Northern Gothic. It was seen again in the fondness for the single round pillar or shaft, often tapered, instead of the clustered pillar. It was particularly observable in the sculpture both of foliage and of the human figure, and in the use of round arches along with pointed ones. There was a certain defect of the constructive sense seen in the apparent overloading of slender pillars, as well as in the prevalence of iron tie-rods to maintain the arches. A third characteristic was the great wealth of colour produced by various marbles, brick and terra-cotta, and by mosaics and fresco paintings. Many of the painters were architects also, and even those who were not showed an intimate knowledge of architecture. The paintings were really allied to the buildings, and not merely applied. The architecture painted as accessory to the figures was in harmony with the lines of the building, and the figure subjects also had the architectural qualities of symmetry, restraint and repose. The architecture, painting and sculpture of the Renaissance were then touched upon, and the same qualities were illustrated up to the middle of the sixteenth century, after which there was rapid deterioration. In the course of the lecture limelight views were shown, among others being works of the Pisanos, the Della Robbia's, Donatello, Ghiberti and Della Quercia in sculpture; and Giotto, Fra Angelico, Benozzo Gozzoli, Filippo Lippi, Ghirlandajo, Raphael and Andrea del Sarto in painting, as well as many buildings and architectural details.

PUBLIC BUILDINGS IN FRANCE UNDER THE FIRST EMPIRE.

[THESE notes from the unpublished journal of Vaudoyer, the architect, give an extraordinary picture of the versatility, energy and restless impatience of the first Napoleon, as well as of the devotion, self-sacrifice and prodigality of the French people under the stimulus of his leadership. They are taken from the *Amis des Monuments*, No. 43, by permission of M. Charles Normand. We see France, which had only just emerged from the throes of a revolution as disastrous as had ever devastated a country, followed by a succession of campaigns in which she had held her own against the world in arms, embarking upon works for the embellishment of the capital and the perpetuation of the heroic deeds of her Grand Army, without a thought as to the cost, on a scale of magnificence unknown to modern times and which can only be compared to the achievements of the ancient Romans, who were the models and exemplars of the French nation. While in England, exhausted by the strain of a long war, the fine arts had sunk to an extraordinary state of degradation, in France there was a remarkable revival, and architecture, painting, sculpture and the subordinate arts and industries flourished with a vitality and vigour unknown in the time of the Grand Monarque. And this revival was not a factitious revival stimulated and sustained by the Court, but came from the people and owed its strength and impulse to the democracy, who since the revolution felt that they had an interest in their country they had never known before. Architecture appears to have particularly profited by this revival, and the number of architects employed by the State is a very interesting feature of the times. Another feature is the rapidity with which the works were carried out; the Arc de Triomphe in the Champs Elysées was begun before the design had been resolved upon and was pushed forward with astonishing quickness. The same with the column in the Place Vendôme, which was only decided upon on January 1, 1806, and on October 8, 1807, the whole of the stone-work was finished, several of the bas-reliefs were cast and the others were promised before the end of the winter. Cardinal Dubellay died on June 13, 1808, and on June 18 the Emperor decrees him a monument in the metropolitan church. These were stirring times, and, as an enthusiastic reporter exclaimed, "When was ever such a noble career opened to the fine arts!"]

Library of the Louvre, 3 Fructidor, Year 9 (August 20, 1801).—Decree of the First Consul on the report of the Home Secretary ordering the transference of the National Library to the Louvre, and that the private persons lodging in the Louvre should quit the premises before the 1st Frimaire. The present library buildings to be sold. After the 1st Frimaire no fire is to be lighted in any portion of the Louvre. The new library to be installed there in the course of the year 11 (1803).

10 Fructidor (August 27, 1801).—The Minister of the Interior has appointed a Commission, consisting of Citizens Brognart and Noury, architects, Taunay, painter, and Pajou, sculptor, to report as to alternative lodgings in the national domains.

42. Death of Antoine, Architect to the Mint, 7 Fructidor, Year 9 (August 24, 1801).—Citizen Antoine, architect to the Mint, died of apoplexy coming out of the theatre during an excessive heat, after a heavy dinner. He was between sixty-six and sixty-seven years of age; he leaves no family. His death causes a vacancy, with a residence, at the Mint and a chair at the National Institute. Heurtier succeeds him at the Institute.

46. Fair at the Louvre.—A fair has been held in the courtyard of the Louvre for the sale of industrial masterpieces. It is 15 feet deep and the buildings 30 feet long; the passages are 6 feet wide and each quarter consists of Ionic intercolumniations placed 9 feet apart from the centre, with a projecting column 3 by 3 surmounted by a figure on an attic base. The whole has been very solidly constructed under the superintendence of Citizens Raymond and Chalgrin.

48. Colossal Bust of Bonaparte at Marseilles by Chardigny, 9 Vendémiaire, Year 10 (September 30, 1802).—In the *Journal des Bâtimens Civils* of the 9 Vendémiaire, year 10, description of a new avenue and monument to Bonaparte at Marseilles by Chardigny.

49. Biography of Antoine, 9 Vendémiaire, Year 10 (September 30, 1802).—Lassant makes a report (printed) on the late Antoine, architect to the Mint.

51. The Academy of Four Nations, 19 Vendémiaire, Year 10, Government Decree (October 10, 1802).—*Art. 1.*—The school of painting, sculpture and architecture will be transferred to the College Mazarin, and will be called the Palace of Fine Arts. *Art. 2.*—The professors attached to the school will be lodged in the palace. *Art. 3.*—The Sorbonne to be placed at the disposal of the Home Secretary (Minister of the Interior), for the housing of literary men and those artists who cannot be accommodated in the College Mazarin. *Art. 4.*—The central School of Four Nations to be transferred to the Collège du Plessis.

77. **Removal from the Louvre.**—Artists to receive official notice to remove. Some to be rehoused in the Academy of Four Nations, at the Sorbonne and at different hotels. Those who cannot be rehoused, for want of room, to be promised 300 livres a year. Those who are rehoused to receive at once, at one payment, a sum of 300 livres for the expenses of removal; those who are not rehoused not to receive this indemnity. The lodgings of the late Citizen Mouchy in the galleries, which have been vacant for six months, are to be given to Citizen Vien the younger, with a view to the keeping up of these lodgings.—(See *Art.* 51.)

53. **Place Bellecourt at Lyons, 1 Brumaire, Year 10** (October 22, 1802).—The Prefect of the Rhone has instituted a competition for rebuilding the Place Bellecourt at Lyons. It is feared that he will fall a victim to his mistake, and that the work will be given to a competent man who will not compete in consequence of the disrepute and state of degradation into which competitions have fallen. Linguet says that it is only parish priests who enter into them in good faith.

54. **Monument to Bonaparte and Peace (at Paris) by the Department of the Seine, 10 Brumaire, Year 10** (October 31, 1802).—The Prefect and the Council of the Department of the Seine decree that a monument shall be raised at Paris which shall transmit to posterity the gratitude of the City of Paris to Bonaparte, the First Consul. The general council, acting as the Municipal Council of Paris, adopted without discussion and appointed a commission, consisting of Citizens Bellard, Perrier, Demantort and Quatremer, to report in ten days and to take measures to facilitate the erection of the monument. The monument will take the form of a triumphal portico, which is proposed to be placed on the Place du Châtelet. Bonaparte has accepted, but has adjourned the execution for posterity, if it confirms this decree.

57. **Colossal Statue of Bonaparte, 16 Brumaire, Year 10** (November 7, 1802).—Citizen Comolli, director of the Academy of Sculpture, Turin, exhibits for 30 livres a head Rue de Lille (Hôtel de Salm), a statue of Bonaparte as a peacemaker, 12 feet high, sheathing his sword.

65. **Statue in Pewter (for blanc) 14 Frimaire, Year 10** (December 4, 1802).—The King of Prussia is about to erect a statue to his great uncle at the barrier of the Allée des Tilleuls. The statue and horse will be of pewter, painted in natural colours as if they were alive, and will be placed on a mound (tertre) 6 feet high, without a pedestal.

66. **Chandeliers of Theatres, Frimaire 10^e.**—The chandelier of the Théâtre Français, Rue de Richelieu, containing . . . argand burners (quinquets*), has cost 40,000 livres (1,600*l.*). The chandelier of the Theatre of the Opéra, Rue de Richelieu, containing 100 argand burners, cost 75,000 livres (3,000*l.*). They are suspended by brass wire ropes (laiton), containing from 400 to 500 strands.

80. **Library of the Louvre, 23 Thermidor, Year 10** (August 10, 1802).—Decree of the Consuls of 23 Thermidor. The necessary works for the dilapidated buildings and the library will be pushed on with the 25,000 francs (1,000*l.*) a month advanced by the Treasury, to be repaid out of the result of the sale of the old materials and fittings of the old library.

89. **Garden on the Peristyle of the Louvre, 15 Frimaire, Year 11** (December 5, 1803).—The late M. Vatelet resided for a long time in the south-east pavilion of the colonnade of the Louvre. He had the use of all the flat roof of the colonnade from this pavilion to the pediment in the centre. This terrace is covered with lead. M. Vatelet covered it with earth from 3 to 4 feet thick for its entire length, and laid it out as a garden, which remained from 1770 to 1790. The trees in it were strong and shady. Citizen Janvier, a clockmaker, who succeeded him, complained in 1792 of the percolation of water through the joints of the soffits and architraves. M. Hubert, the then architect to the Louvre, paid no attention, and it was only after much difficulty and delay that the earth was removed. Two men were employed for eleven days throwing the earth over the balustrade into the courtyard. The lead was found to be in holes and the joints of the masonry were decayed and open. The lead was repaired and gardens will no longer be allowed on the terrace. How could M. Vatelet, who was a lover of the fine arts, allow himself such a destructive indulgence and the architects put up with the evil for twenty years?

95. **Quay Bonaparte, 15 Messidor, Year 10 (? 11)** (July 3, 1802).—M. Chaptal, minister of the interior, with the corps of the Ponts et Chaussées, lays the first stone of the Quay Bonaparte; it is partly opposite the Rue de Bourgogne, which is three steps below the level of the footway of the said quay. This quay will have had two first stones in ninety-four years, one at each end, as the construction of the quay, starting from the Pont Royal, was authorised by a decree of the Council given at Versailles, August 30, 1707, and Boucher Dorçay, mayor of Paris, laid the first stone, July 3, 1708.

* Named after Quinquet, the maker's name, but invented by Argand.

129. **Low Opinion of Architecture and the Fine Arts, 30 Pluviose, Year 13** (February 18, 1805).—Architecture vegetates, and no public buildings are undertaken; those already built are abused by being made use of by institutions varying in object, and consequently in wants and arrangement, every two or three years. The Luxembourg has already been put to different uses five times, without taking account of what will yet be done with it.

The sovereign does not like architecture; his ministers in consequence mistrust everybody calling himself an architect, and to flatter the prince do not hesitate to proclaim it. Here is an extract from the report of the Finance Minister to the Emperor, taken from the *Journal de Paris* of Pluviose 30, year 13 (February 18, 1805). "How often have we heard from his lips—the greatness of sovereigns does not consist in the vast extent of their domains, nor in fortresses which call forth the efforts of the enemy instead of arresting him, nor in the public buildings erected by the vanity of one generation which the indifference of another generation allows to fall into decay. It consists in its institutions, which strengthen the mind, which preserve manners, which diffuse enlightenment." Louis XIV. thought quite otherwise, and his public buildings, by animating every branch of industry, considerably enriched his kingdom, attracted numbers of foreigners and increased his fame.

112. **Imperial Grand Prizes every 10 Years, 24 Fructidor, Year 12** (September 10, 1804).—An imperial decree at Aix-la-Chapelle establishing grand prizes, to be given every ten years by the Emperor's hand, that is to say, 9 of 10,000 livres (400*l.*), 13 of 5,000 livres (200*l.*), to everything useful and great except architecture, the art pre-eminently for the illustration of empires.

164. **Numbering of Houses in Paris, 1 Vendémiaire, Year 14 (?)** (September 22, 1806).—The prefect of the department has had the whole of the houses in Paris numbered. The numbers are painted in oil with nails (*clous*), grounds and shaded letters. The work was put out to tender in four sections. One section was tendered for at 19 centimes a number, including nails (*clous*), grounds, figures, shading, &c.; another 20 centimes, another 21 centimes, another 23 centimes; the even numbers are on the right of the streets, starting from the centre, the odd numbers on the left. The numbers running from north to south are red, those running from east to west are black.

175. **Column to Napoleon at Paris** (January 1, 1806).—The Tribunal agrees to erect a monument of arts and a column to H.M. the Emperor (*Nouvelles des Paris*). "Last Monday the Tribunal held an extraordinary meeting at which, after having heard the report of the members of the deputation which had been to the Grand Army, M. Jard Panvilliers proposed to proceed immediately with the inauguration of the flags sent by the Emperor; M. Favard proposed to have a medal struck relative to this donation; M. Chabot (de l'Allier), to name one of the open spaces of Paris, Place Napoléon le Grand. M. Faure, the reporter of the commission appointed to erect a monument, has proposed in its name to erect on one of the principal squares of Paris a column and a national edifice, in which to place all the national works of art (*Monuments des Arts*), with the sword carried by the Emperor at the battle of Austerlitz, and to establish an annual festival.

178. **The Emperor Visits the Works of the Louvre and of the Sculptors remaining there** (February 1, 1806).—January 30, H.M. the Emperor visited the works of the Louvre. He seemed satisfied with the progress of the buildings, and to see what had been the subject of discussion for more than a century carried into execution in less than two years. After having entered into the minutest details with the architect, His Majesty has given fresh orders to add still further to the splendour of this noble asylum of science and art. He examined with no less interest in M. Moitte's studio the tomb of Desaix, which will be conveyed in the spring to the monastery of Great St. Bernard. On leaving this studio he afterwards visited M. Dejoux's studio and appeared pleased with the plaster model of the same hero, which will be executed in bronze to decorate the Place des Victoires. In the course of his visit the Emperor, who was unattended, crossed the courtyard of the Louvre in the midst of the people, who crowded around him, and by their exclamations of delight expressed their joy at the air of goodness and satisfaction imprinted on every feature of the sovereign (*Journal de Paris*). On returning to the Louvre the Emperor, on passing through the museum, observed the colossal bronze bust executed during his absence, and which is now placed in the Apollo Gallery, and "et toute la suite si curieuse qui manque."

183. **House of Prince Eugène, Stepson of H.M. and his adopted Son since that Prince was made Viceroy of Italy** (February 1, 1806).—During the last eighteen months M. Bataille, architect, has been adapting No. 82 Rue de Lille as a residence for Prince Eugène. The arrangement is magnificent. The Emperor had the bill sent to him, which amounts to 1,500,000 francs (60,000*l.*). This put him out of temper, and he stopped the works, which were nearly completed.

187. **Throne by Auguste** (February 20, 1806).—"It is said that Le Sieur Auguste, a talented goldsmith, has presented drawings of a throne which for richness and workmanship will come up to the splendour which the court of France should exhibit in State ceremonials." This throne was invented and drawn by MM. Lebas and Debret. M. Auguste has not paid them for their work and has appropriated their fame. He has been declared bankrupt.

200. **Palace of Chambord, to be adapted for the Education of 100 Young Daughters of Members of the Legion of Honour** (May 10, 1806).—Decree of May 2, ordering that the palace of Chambord shall be adapted to maintain and educate 100 young girls, daughters of members of the Legion of Honour. The expense will be defrayed out of the funds of the Legion. The grand chancellor of the Legion, M. Lacépède, is entrusted with the execution of this decree.

201. **Triumphal Arch of the Star**.—The difficulty of erecting a triumphal arch at the Bastille having been demonstrated by the commission, it is settled that it shall not be erected at the Bastille, but at the Barrière de l'Etoile at the end of the Champs Elysées. MM. Chalgrin and Raymond, architects, of the Institute, are entrusted with this monument, which in view of its position will be of colossal size and will cost several millions. The foundation will cost 900,000 francs (36,000*l.*).

203. **Triumphal Arch or Column at l'Etoile** (June 1, 1806).—The works for the erection of a triumphal column on the Place de l'Etoile, beyond the Chaillat barrier, were commenced three days ago. The workmen have excavated the site for about 30 square mètres for the foundations of this new monument; materials are arriving daily. Enormous blocks of wrought stone are already lying about this vast open space on which converge the four routes of the Champs Elysées, Neuilly, Roule and Passy (*Journal de Paris*).

The newspaper is in error in speaking of a triumphal column: it is a triumphal arch which will be erected at l'Etoile, unless the plans are changed. On August 15, 1806, the excavation having been carried 23 feet deep in very firm sand, the first course of footings (?) was laid.

(To be continued.)

ARCHÆOLOGY IN CRETE.

AT the meeting of the Hellenic Society on Monday last Mr. Arthur Evans, Keeper of the Ashmolean, read a paper on his discoveries in Crete. He observed that in the absence of abiding monuments we ought not to forget that evidences of early culture could be traced in other forms than those of the remains of ancient buildings. Traces of picture writing are to be found in various parts of Europe—in Denmark, for example—and abundant remains of this character were discovered in Crete. Last year in Crete he found curious seal stones containing symbols affording singular parallels to the Hittite monuments. There was also an unclassified stone found by Mr. Greville Chester which fitted into the same series. It was clear that there had been a civilisation before the foundation of the Greek States. The remains seemed to indicate that Greek particularism had been prejudicial to the early civilisation of Crete. There were inscriptions, which might probably be assigned to about 700 B.C., in archaic Greek characters, but in a language which was unknown to us. The foundations of houses and shrines were of much the same type as the remnants still extant of Tiryns and Mycenæ. The ruins were also found of a second acropolis like the pre-historic city of Troy. There was also a remarkable monument, which deserved investigation, of a Mycenæan building which might be the famous labyrinth, or a palace. Traces of it were first discovered by Mr. Stillman. There were many pictorial symbols, from which seventy or eighty different symbols had been roughly classified. From these remarkable parallels might be traced with Egyptian and Hittite inscriptions and picture writing. The date of some of the remarkable correspondences with the Mycenæan type was probably about 1500 B.C., but the earliest class of symbols may even have been before the Mycenæan period. There had also been found Egyptian scarabs of the twelfth dynasty; and there were the beginnings of the spiral system which played so great a part at Mycenæ. Linear forms were discovered to have gradually grown out of the pictographs, and there was evidence for believing that the Cretan system was part of a larger one which extended to the Peloponnese. Parallels might also be discovered with Semitic remains, and those were remains of a character which should make us hesitate to accept the theories of the origin of the alphabet from hieratic forms. The origin of the Philistines might perhaps also be traced through Crete, and it was remarkable that in the version of the LXX. the Philistines were called Cretans, or even Hellenes, which led to the conclusion that they were probably islanders. It was probable that the Philistines played a great part in civilising Semitic lands.

WANDERINGS IN NORTH AFRICA.

A PAPER was read by Mr. Thomas Kay on his "Wanderings in North Africa," before the Manchester Literary Club, on Monday. It was supplemented by several water-colour drawings by the author and oil paintings by Mr. R. G. Somerset. Mr. Kay described the present condition of Tebessa, the Theveste of Hadrian. It was built by the Romans to form a guard and fortress against the predatory Bedouins of the great Sahara, which lies to the south. It possesses now the same supply of good spring water which the Romans conducted within its walls. The assaults upon Tebessa in ancient days reduced its inhabitants so much that under Saracenic rule the walls were built to enclose only a part of the old city, and in them are to be observed massive pillars laid horizontally through them, for their strength and immovability, at the expense of some majestic buildings destroyed to make these defences. Fortunately, on the lines of the new walls the triumphal arch of Caracalla was enclosed, and made into a gate of the city. The date of this arch is about 212 A.D., and is a fine and well-preserved example of the four-faced gate. The basilica at Tebessa is one of the most remarkable ruins of a complete edifice of the Roman period to be found in Africa. The great hall is about 200 feet long by 25 feet wide. The fine tessellated pavement is still perfect in the great hall and in the judges' chambers, but is covered with earth for their preservation. The Roman aqueduct for the supply of Carthage was also described. It is a distinct landmark over the long plain, although the magnificent tiles and marbles used as ornamental work have been taken away. The aqueduct delivered 7,000,000 gallons per day to Carthage and the district. Its remains are fast disappearing, being used by the French in the making and repairing of roads. Constantine, which occupies one of the most remarkable and picturesque sites in the world, possesses now few remains of its ancient grandeur; its mosque has been converted into a Christian church, the citadel has been rebuilt and converted into a modern French barracks. One prefers to think of it as the acropolis of Massinissa, the brilliant fighter whose story lives in history as a revelation of the character of the men of the distant past. The story of Sophonisba, one worthy of the tragic muse, is also set in this city of Constantine. It has occupied the pens of both English and French dramatists, though Thomson spoiled it not a little with his absurd "Oh, Sophonisba! Sophonisba, oh!" The paper concluded with a description of the phosphorescent effects seen at night off the coast of Africa.

GENERAL.

An Exhibition will shortly be held at the Ecole des Beaux-Arts in Paris, which is to illustrate the excavations undertaken at Delphi by the students of the French school in Athens.

A Statue of Meissonier, by M. Fremiet, will be unveiled on Sunday next in Poissy, a town where the painter lived and served as *maire*.

The **Damfries School Board**, after considering plans and estimates for reconstruction of the Academy buildings, have decided to invite architects to send in plans for a new building. The estimated cost of reconstruction is about 7,000*l.*, while new buildings are estimated to cost only 10,000*l.*

Mr. Johnson, of Abergavenny, has been selected as the architect of the new workhouse infirmary which is to be built at Merthyr, at an estimated cost of about 10,000*l.*

Mr. George Highton has been elected to the vacant vice-presidential chair of the Society of Architects. It is understood that Mr. Highton continues his close connection with the administrative body in order to help forward the examination for membership which was inaugurated in his year of office.

Mr. G. B. Birch has been elected curator of Sir John Soane's Museum, in succession to the late Wyatt Papworth.

Mr. Richard Clarke, who was for many years known as a valuer in Birmingham, Walsall, Wolverhampton and the surrounding districts, died on the 16th inst. of typhoid fever. He was in his forty-third year.

The Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels held its first monthly meeting for the present session on the 15th inst. at the Society's house, No. 7 Dean's Yard, Westminster Abbey, S.W., when many grants were approved.

The Directors of the Aberdeen Royal Infirmary have received a letter from Mr. D. M. A. Chalmers, advocate, intimating that the trustees of the late Mr. John G. Chalmers, Banchoory, were prepared to give from his estate the sum of 5,000*l.* (2,000*l.* to the building fund and 3,000*l.* for endowment) towards a proposed new convalescent hospital, on condition that it be conducted as part of the Royal Infirmary.

The Architect.

THE WEEK.

THE London Building Act, which comes into operation on January 1 next, has a number of provisions with respect to the height and curtilage around buildings, as well as other matters that are of great sanitary importance. The Council of the Sanitary Institute have, therefore, arranged for a discussion to be held at the sessional meeting on December 12, at 8 P.M., on the sanitary aspects of the Act. It will be opened by Dr. G. B. LONGSTAFF, chairman of the building act committee of the London County Council. Other members of the County Council, members of local boards and vestries, and officers who will be concerned in carrying out the provisions of the Act, are expected to take part in the discussion.

A MEMORIAL has been sent by the Glasgow Institute of Architects to the Town Council respecting the practice adopted for designing Municipal Buildings in the city. The objections of the Institute are as follows:—1. The city engineer, as he is not an architect, is not himself qualified to design works of architecture. Even if he were so qualified, the duties of his office are such that he cannot have the time at his disposal for the quiet conception and elaboration of the design of public buildings, nor for the efficient superintendence of such works in course of erection. 2. To depute such work to assistants, however qualified, cannot be so satisfactory as it would be to commission independent architects of ability and experience. An assistant has neither the stimulus nor the sense of responsibility of an independent architect and there is no assurance of permanence in his position. Should he develop marked ability, it is probable that he will either elect to practise in his own name, or accept an office of more importance in another city. In dealing with contractors, in securing that the terms of a contract are faithfully carried out, and in the settlement of accounts an architect has more authority, as he has more direct responsibility, than any assistant, however competent he may be. 3. The existing arrangement is not an economical one, and on this ground alone the subject is worthy of full consideration. 4. The design and erection of the public buildings of a city are among the opportunities that architects are entitled to look to for the exercise of their abilities, and their employment would offer to the authorities a much wider field for the selection of architects possessed of special qualifications for particular work than they can have among the assistants of the city engineer. The Council of the Institute do not undervalue the knowledge and experience of the master of works, of the city engineer, or of their staff; but they believe that the attainments of these gentlemen would be of more advantage to the community, so far as important public buildings are concerned, if they were used in the first place in advising the committees of the Town Council in charge of such works, and afterwards in consultation with the architects who should be employed to design them. 5. It is among the most important duties of a municipality, acting on behalf of the community they represent, to foster and encourage the arts, and particularly the art of architecture, upon which the amenities of a city are more dependent than on any other. The Council of the Institute submit with confidence that the course they recommend to the consideration of the Town Council, in addition to its other advantages and economies, would tend, both directly and indirectly, to the improvement of the architecture of the city.

THE advance due to experience in the planning of schools is seen in the action of the London School Board about the school in Olga Street, Bethnal Green. It was erected twenty years ago, and was supposed to exemplify the practice of the time. The inspector of the Education Department lately described the infants' school as "conducted under considerable disadvantages, the arrangement of the premises being adverse to proper organisation.

Many of the classrooms have to be used as passage rooms, a most undesirable arrangement, which ought if possible to be modified. Most of the classrooms are badly lighted." The architect of the Board, to whom the matter was referred, is of opinion that it would not be advisable to incur any expenditure upon the present infants' department, owing to the serious structural difficulties in the way of its improvement. The works committee, after careful consideration, have come to the conclusion that it will be more economical to erect a new infants' school upon additional land, the cost of the new building being estimated at about 6,000*l*. It is also considered desirable at the same time to rebuild the present offices in another position and to provide a new system of drainage, the cost of this additional work being estimated at 1,500*l*. Application will accordingly have to be made to the Educational Department to sanction the loan of 7,500*l*. for the work.

THE French publication *L'Art* appears to become still more English as the volumes appear. A series of etchings on a large scale, after Sir J. REYNOLDS, is now appearing among the numerous illustrations, the latest example being the *Lady Mary Dashwood and Child*. Another etching in the last number is one of the late Mr. P. G. HAMERTON'S Scottish scenes. M. PAUL LEROI does ample justice to the author's merits. M. ERNEST CHESNEAU, whose book on the English school is appreciated, has an elaborate article on DANTE ROSSETTI and the pre-Raphaelites, which surprises from the extent of the author's acquaintance with modern English art. An article on HUBERT ROBERT is interesting, and it is embellished by copies of many of the artist's representations of Italian buildings. *L'Art* being now in its twentieth year may be said to have attained its majority, and it still upholds the excellence with which it started, a remarkable feat for a publication of its class.

THE church of St. Michael, Linnithgow, is one of the most interesting in Scotland. It is of great antiquity. Unfortunately, it was one of the few churches that suffered at the time of the Reformation, for it should not be forgotten that JOHN KNOX preached no crusade against buildings. In CROMWELL'S time the soldiery were more vandalistic, and the surviving pictures, statuary and carved work were destroyed, the only statue escaping being that of St. Michael, on the southern corner, which from its exalted position was beyond their reach. At present the church is being restored under the care of Mr. JOHN HONEYMAN, who is carefully reproducing the old lines as far as possible. A paper on the subject was read before the Glasgow Archæological Society on Tuesday, when a warm recognition was made of a lady's generosity in enabling the architect to restore the beautiful chancel arch which had been broken down in 1811, to make room for the hideous galleries erected in the choir at that date. Many interesting details were brought out in the subsequent discussion. The hope was expressed that the restoration of such a stately and ancient church would not be retarded through lack of funds, and that lovers of Church and country would not be slow in supplying the 15,000*l*. required.

THE "Railway and Traders' Calculator" and the "Direct Calculator," prepared by Mr. M. B. COTSWORTH and published by Messrs. CROSBY LOCKWOOD & SON, are the most ingeniously arranged and the legiblest of all ready reckoners. They have been arranged to suit the new railway rates, and for all who have to pay carriage on goods they will save time in calculating and insure accuracy. Their utility is not confined to that purpose. They are no less helpful in all business transactions which depend on weights. The calculation of wages is also an advantageous addition. The tables are printed on stout paper which will bear rough handling, and the indexes are on canvas strips. From their simplicity they can be used by men who are not expert arithmeticians, and the quickest calculators would admit that they could not compete with them in working out intricate multiplication.

METALLIC CONSTRUCTION IN AMERICA.

"WHEN I asked an ironmaster about the slag and cinder in iron," says EMERSON, "he said, 'There's always good iron to be had; if there's cinder in the iron 'tis because there was cinder in the pay,' and the words must appear to be more significant to anyone who reads an account of the Architects' Convention which was held about a month ago in Chicago. That metal is largely employed in the construction of buildings, and especially the lofty buildings in American cities, is known to all the world, and it must always be expected that when architects or contractors meet in conference they will talk about columns and girders. On such occasions it is to be anticipated that the merits of the materials will be expounded, and that new developments of their use will be foreshadowed. Iron and steel are more closely connected with the nineteenth century than with any of its forerunners, and it is allowable that all who make use of either should be hopeful about the future. But from what was said in Chicago it might be supposed that the materials are found to be a delusion, and that structures containing them are about to vanish, owing to their inherent weakness.

If more than the usual quantity of slag and cinder were lately mixed up with the metal that would be enough to excite despondency. But probably the cause arises from the introduction of iron and steel to an excess in buildings. Americans are fond of analogies, and apparently they consider they are following the examples set up by nature when they make a sort of skeleton of iron and steel for every building and employ other materials as a mere covering or wrappage. The practice, which is now common in the United States, of regarding a building as a metallic cage, with a continuity of iron or steel beams and columns from roof to foundations, certainly never entered into the visions of TREDGOLD, or FAIRBAIRN, or the pioneers in iron construction. Whether their primitive and timid ways were right or wrong remains to be seen, but they would not serve in America.

At the Chicago Convention the attack on metallic construction was led by Mr. GEORGE B. POST, who was described by the chairman as having more experience than any other man in America or elsewhere in the construction of tall buildings, one being 350 feet high. He began with the following remarkable prophecy:—

It is my positive opinion, formed after considerable study of the subject and consultation with the best engineers that I could get hold of, that the life of buildings constructed with steel cages will be but short. They will last longer than I will, but I believe that there are men in this room who will live to see the necessity of taking down many of these buildings, or else of resorting continually to most radical systems of repair in construction. In my individual experience I have taken out from a building a number of wrought-iron beams which had been thirty-five years encased in solid brickwork—not in plaster, as we build at present, but with 8 inches of brickwork around them and levelled up to the floor with concrete. These beams had been subjected to live steam, as they formed the ceiling over a well-conducted engine-room, a room containing printing-presses, and very many of these beams were entirely destroyed by rust; you could take them and break them, in this way, with your finger. As far as I know, it is impossible, with paint or asphaltum, to protect a great system of steel or iron construction so that it will not be assailed by rust, so that we can surely protect it in all its parts from corrosion.

We imagine that EMERSON's ironmaster, if he heard Mr. POST, would ask whether the beams were produced at a fair price? Wrought-iron so well protected would not dissolve, if we may judge by English experience, unless there was a superabundance of slag and cinder. In Europe it is supposed that the worst iron that can be produced is durable, especially if from time to time it receives a coat of paint; but we suppose American ingenuity can compound stuff of a kind which is unknown among us. Mr. POST explains the phenomenon by saying that as the beams are laminated, and are corroded by moisture or gas, they cannot last long. It cannot be denied that, like all things on earth, iron and steel are doomed to destruction, and rust is only a consequence of an universal law. Thirty or forty years ago the danger arising from the action of the atmosphere was underestimated, and the webs of beams were made of the thinnest of plates as if rust was an impossibility. There is now more prudence exercised, for it is known that the thickest web plate is not entirely waste of material, as it sustains its share of strains. When beams were entirely inaccessible there was also increased

risk, as it was not feasible to protect the surfaces periodically by painting or other treatment. Mr. POST says he always has made his cage detached in order to permit painting or repairs, and so long as that sort of precaution is taken iron and steel are safe. On account of being less liable to corrosion, Mr. POST recommends the use of cast-iron instead of steel for cages, but few architects will care to make the experiment. If science could furnish a convenient process for detecting flaws or irregularities in casting, the material might then be more often introduced in buildings. Mr. ROBERTSON, while admitting the danger of corrosion, proposed to minimise its effects by the use of lattice girders, with the interstices filled in with brickwork:—

It seems to me that 8 inches of brickwork on the exterior of all the construction, with latticed girders instead of the old method of double beams at each panel, with the brickwork built in through the openings of the latticed girder, making a complete bond through the construction, with the building carefully painted on the exterior, will almost indefinitely protect iron or steel which should have been, before it is placed, of course, properly painted—almost indefinitely protect them from corrosion; but the point that should be looked at first is that all the joints in the exterior of the building should at all times be kept thoroughly painted, and that the building should be thoroughly painted. For I believe that paint on the exterior of the building is a very valuable protection, much more so, in my opinion, than glazed brick. And the only fear then would be, it seems to me, that some unseen fissure or joint might be left open, and water reach some of the vital parts of the building and corrosion take place, which might ultimately bring about trouble. But it seems to me that with a little expense and considerable attention that the whole exterior of the building should be entirely protected from the possibility of the absorption of moisture.

The examples which Professor BURR was able to refer to from his own experience are enough to make everybody sceptical about American ironwork. In one instance two large cast-iron weirs became useless within a fortnight from cracks. At another time numbers of the castings employed in elevated railways exploded, making a noise like so many pistol-shots. Castings have fallen into such disrepute, American engineers will only employ them for wall-plates. Professor BURR considers that wrought-iron will resist corrosion equally with cast-iron. He buried plates of both for about two years, and on taking them from the ground he could not discern any difference between them in appearance. Professor BURR denied that steel beams suffered from lamination, a theory which corresponds with the observations on this side of the Atlantic.

Mr. BURNHAM related some instances of his experience of cast-iron which will suggest the peculiar sort of morality which prevails in American manufactories:—

There was a column in the first storey of an eight-storey building. It was inspected in place. I don't know what led me, or the superintendent on the job who came to me, to fear that there was something radically wrong, but at any rate—the column was about 2 feet in diameter and of 2-inch metal—a workman with a point and a striking hammer was sent to that column and two others to test the surface. He found that that particular one was honeycombed three-quarters of the distance around it, the surface, and at least 3 feet high, so that there was not remaining, in places at least, one-half the periphery, more than a quarter of the metal. It was filled with white metal and had then been painted over very carefully. There was a column brought to one of our buildings one morning for the basement, about 10 feet long, perhaps 12; it was a ten-storey building; the column was, I think, about 2 feet in diameter and of 2-inch metal. In handling it from the wagon it fell on the street and broke. There was an air chamber in that column three-quarters of the distance around it and it was at least 2 feet long; it extended nearly around the column; it was absolutely concealed inside; and it was so well concealed that if struck with a hammer, I doubt if anyone not having an extremely delicate ear, could have detected the flaw. Luckily that column broke and disclosed that condition. Since that time I never have used a cast-iron column because of the impossibility of making a proper inspection which would cover the air chambers inside of the casting. But I don't suppose there is ever a column set up originally which is perfect.

Defective casting will take place under the most honest superintendence, but in the above cases the flaws were concealed, and life as well as property was risked for the sake of a trifling saving.

Apparently it is not the metalwork alone which is defective. The following remarks on the mode of building in New York at the present time, by Mr. POST, indicates that bricks are of an extremely loose texture, and when combined with cindery iron, destruction cannot long be delayed:—

I think it is terrible to see buildings going up in the city of New York as I have seen them going up during the last two or three years,

where the iron columns have been given a very light coat of paint, very little attempt made to protect the joints—put up, it seemed to me, with a good deal of recklessness, in a good many cases with no protection except 8 inches of ordinary brickwork. I do not believe they will stand for any very great length of time with perfect safety. I do not know if you gentlemen have had the experience with brick walls that I have. I have seen the water, in a north-east storm in the city of New York, go through a 4-inch brick wall and run down on the inside of its surface as though there was nothing there; a wall 150 feet high, exposed to a north-east storm, and water go through a 4-foot wall at the second storey and run down on the inside, the wall being unpainted. The condition of a beam encased in cement and in a foundation is a very poor guide for what will occur in a case where there is a north-east exposure, we will say, on a wall with only 4 to 8 inches of masonry. Every time that a storm strikes that brickwork it becomes soaked with water, and will remain soaked for a considerable time.

After such revelations, it appears to be absurd for an European to visit the United States in order to increase his knowledge of construction. The worst jerry-built houses of English towns are less dangerous than the cloud-clapped American buildings, which, like those in PROSPERO'S pageant, seem destined to dissolution rather than decay.

THE GERMANS AND CLASSICAL ARCHÆOLOGY.

THE announcement this week about the request of the Greek Government to the German Government for an architect who would be competent to decide upon the best way to preserve the Parthenon is humiliating to the English people for several reasons. A commission of Greek and German architects it appears has already discussed the subject, but the members are not unanimous about what should be undertaken. An arbitrator is therefore sought, and as a matter of course he is to come from Germany. If the Greek officials were asked what directed their choice they would have no difficulty in replying. It would be pointed out that for the greater part of the century the Germans have been engaged in a systematic study of archæology in many parts of Greece as well as within the boundaries of the ancient Roman Empire; that the most important discoveries are associated with the names of Germans, and that a student is not supposed to be acquainted with the elementary facts of classical archæology unless he has studied under a German professor or from German books. It could be also shown that in England and America Germans are sought out to become professors of the subject in universities and colleges, that English essays on classical archæology are notoriously made out of German publications, and so general is the belief in the monopoly of knowledge on archæology and art by the Germans, that it requires some courage in an English traveller to be seen in Rome or Athens carrying a guide-book which was published in England. For all these reasons, besides others unmentioned, the Greek Government would say they expected the approval of the whole civilised world when they sent to Berlin for an architect to determine the fate of the Parthenon and the operations to which it must be subjected.

It is only natural that many Englishmen will consider the Greek Government to have acted unwisely. They will say that the whole world, including both Greece and Germany, can yield evidence of the constructive skill of Englishmen, and that an English architect would be likely to devise the simplest way of remedying the disturbances in the masonry of the temple which arose out of the earthquake. It could also be explained that if one English ambassador despoiled the temple some compensation was returned by the efforts which STUART, REVETT, PENROSE, PENNETHORNE and others made to reveal all the beauties of the building. A Greek would agree with that view and be complimentary about English construction, but he would say that all the English efforts were those of individuals and never received any public sanction, consequently they have not much impressed people outside England, while the Germans seem to have followed a prepared plan or which the whole Fatherland was, as it were, responsible, and the work of the humblest explorer could not be considered as a mere individual effort arising out of accidental circumstances.

It must be allowed that the Germans have not only worked but combined for the supremacy which they have

attained in classical archæology. We may not be satisfied with their success, but there is too much regard for justice in England to withstand the appreciation of efforts which have been well advised, continuous, enthusiastic and self-sacrificing.

Nor should it be forgotten that in Greece Frenchmen and Englishmen had gained a hold on the country and its architectural remains long prior to the appearance of the Germans. In the seventeenth century it was the custom of the French ambassadors to render personal homage to literature and art in Greece. In 1632 the Baron CORMENIN, in the account of his "*voiage fait par le commandement du roy*," describes the Parthenon. The Marquis DE NOÏNTEL had drawings made by CARREY, one of LEBRUN'S pupils, which will always be invaluable, if sometimes puzzling. Some time between 1630 and 1640 a French consulate was established in Athens. In the convent of the French monks the respect of art and antiquity was religiously professed, and one of the priors purchased the monument of LYSICRATES in order to preserve it from demolition. The French Capuchins in the sixteenth century prepared a bird's-eye view of Athens for the instruction of travellers. The books of BOBIN (a Jesuit), SPON (a medical doctor), and others, are evidence of the interest which two centuries ago the French felt for Greece. Of all Western people they have the best claim to priority of possession, and if they desired they might have acquired every ruined temple in the country, and filled France with ancient marbles.

WHELER, whose book appeared in London in 1682, is probably the earliest representative of England who was occupied with the archæology of Greece. STUART and REVETT visited Athens in 1751, and a few years later the researches of the Dilettanti Society were commenced. But so little was Greek work appreciated in this country, it was necessary for Lord ELGIN to support his application to Parliament for the purchase of the Parthenon sculpture by the testimony of CANOVA and VISCONTI. Before his lordship started for Greece, he informed the Government of that day about his intentions, and suggested that the rescue of the marbles should be considered a national object, and be undertaken at the public expense, but he received no encouragement. Up to the present the most efficient English agent in exploration has been the Dilettanti Society, the most exclusive of bodies, and one that scorns support or advice from outsiders. An effort has been made during late years to establish a British Academy in Athens, but it has obtained only scanty assistance, and the interest in the operations is confined to a few men and women.

As far back as 1573 MARTIN KRAUSSOR, or CRUSIUS, a Tübingen professor, entered into correspondence with some of the Greeks that lived in Constantinople. In 1584 he published several of the letters he received, in the hope of exciting interest in the country, and especially in Athens, which, as one of the letter-writers said, resembled "the skin of an animal which has been long dead." But Germany, which was broken up into petty States, was not in a condition to do much for archæology. It was not until the appearance of WINCKELMANN that the subject gained actuality. He was unable to visit Greece, and all he accomplished was by the aid of a few Roman collections. His plan of writing a pamphlet on an archæological subject, and afterwards sending out another in contradiction of his own conclusions, suggests the nebulosity of WINCKELMANN'S theories. With all its shortcomings, his "*Geschichte der Kunst des Alterthums*" worked a revolution. The Italians VISCONTI, LANZI, FEA and GUATTANI were indebted to it. HERDER, GOETHE, MEYER and HIRT could not esteem it more if it had dropped from the sky. ZOEAGA, HEYNE, WELCKER, SICKLER and many more treated it as an oracle. The study of WINCKELMANN'S history formed a bond in common between Germans of all the States who visited Rome. It became, as it were, one of those dominant ideas which rule a world. GOETHE classed WINCKELMANN with COLUMBUS, and described the history as a book for eternity. In the early part of the century a company of famous Germans were collected in Rome whose principal occupation appeared to be the study of WINCKELMANN. From it they were led to STUART and REVETT'S work and DODWELL'S volume on cyclopean remains, and the three enabled them to realise the extent of the ancient world which awaited investigation. When the members returned to

Germany they took care to infuse much of their enthusiasm in other men, and in their native places they created interest in Classic archaeology. If we remember rightly, there was an expedition to Greece as early as 1810. STECKELBERG, LINCKH, RIEPENHAUSEN, KESTNER, NIEBUHR and BUNSEN continued the work of their predecessors. About 1818 the two last united in an archaeological description of Rome. In 1822 GERHARD arrived in the city, and the following year his investigation of the plan of the Basilica Julia may be said to have suggested a new manner of dealing with remains. It is well to know that the Germans in Rome were not narrow-minded. From the first they considered all their studies in Rome, Italy and Greece as having world-wide relations, and they were anxious to have as much co-operation as was possible. GERHARD proposed the creation of an universal journal of archaeology, which was to be written in French in order to appeal to scholars everywhere.

BUNSEN founded the Archæological Institute in Rome towards the close of 1828, but care was taken that there should be no suspicion of partiality. Archæologists of all lands found welcome in its halls. It was directed by GERHARD up to 1837, when he went to Greece to aid in advancing the study of archæology throughout that region. He was succeeded by EMIL BRAUN, whose name is made so familiar to students by his books and the constant references to his authority that they sometimes find it hard to realise that he passed away forty years ago. Alike under Papal, republican and foreign government in Rome, BRAUN contrived that the prosperity of the Institute advanced. As facilities for travelling increased, the crowds of visitors became so large as to be sometimes embarrassing, but BRAUN was good-tempered, and at times appeared as if he was born for a cicerone. There were worse difficulties to be overcome. Occasionally there were outbreaks of international jealousies to be calmed, and officialdom in Germany was sometimes disposed to cavil at the arrangements in Rome, yet BRAUN went straight on undaunted. When he died in 1856, the pestilent Roman fever having overcome a body that was worn out by daily and nightly toil, the Institute had acquired a maturity which Prussia was proud to accept as belonging to itself in a particular manner, and henceforth the Roman Institute of Archæology was as much of a Government department as one of the barracks in Berlin.

Then the advantage of having statesmen like HUMBOLDT and BUNSEN among the original organisers was apparent. It was not merely the promotion of archæological knowledge which was sought after. Everything was directed towards insuring the supremacy of Germany in one important sphere of thought, and the supremacy of Prussia among all the German States. In Rome the first acts were performed of that drama which was to be concluded amidst salvoes of cannon at Versailles. Throughout all the scenes there was the same patient, far-seeing diplomacy to be witnessed.

But while political ends were sought there was no neglect of archæology. It would require more than one volume to explain the relations between the Roman Institute and the German Universities. Every student of literature, language, art, history, or any subject which takes the past in however slight a measure into its purview, feels there is an obligation on him to contribute something towards the store of knowledge which is to be found in the records of the Institute. To all who wish to find subjects to investigate the Institute is prepared to become a guide, and a man cannot claim the least consideration as an archæologist in Germany unless he can produce evidence that he has co-operated in some of its manifold operations. Wherever there is a college in any of the German towns a student can learn much about archæology, but it is only in Rome the seal can be placed on his knowledge.

To carry out the operations it is necessary to convince the authorities in all lands about the superiority of the German system. Within the last year or two we have had in England an example of how that can be accomplished. The inquiry about the Roman wall in the North of England and Scotland may be said to have been conducted by two military archæologists from Germany. The local archæologists who were most familiar with the remains of the old defence could not help concluding that their knowledge

was of a partial kind when compared with that of the visitors, who might easily be imagined to have been engaged in the Roman war department under HADRIAN, and to understand what differentiated the British line of defence from those in other parts of the Empire. If a question arose about repairing a part of the wall in Westmorland, the County Council would probably consider it an advantage to have the benefit of the advice of the German officers. The reasons which have inspired the Greek Government when they sought in Berlin for an architect to overhaul the Parthenon would undoubtedly be no less applicable in the North of England, and much can be said in favour of them. At all events, we must not be surprised at the action of the Greeks. Like many other people, they have been impressed with the breadth of the archæological studies of the Germans. The explorations which have been attempted in Greece have given opportunities to observe differences in the methods employed by several races, and if the conclusion is come to that the Germans are more thorough in their undertakings, it is one for which there are precedents in other divisions of knowledge besides archæology.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair.

The following gentlemen were elected members:—Messrs. L. D. Philpot, F. J. O. Smith, H. A. Chapman, C. Bree, G. B. Carvill, P. W. Cleave, J. S. Dunn, J. R. Ireson, C. Martin, A. Smithers, E. W. Allfrey, G. Bailey, N. C. Bathurst, T. Bee, A. R. Carey, E. F. Cobb, C. F. Dowson, R. E. Eddison, C. H. R. Hide, E. T. Marriott, C. H. Fowler, H. Mennie, R. J. A. Shield, R. S. Balfour, P. R. Bradford, H. R. Creighton, V. Esch, F. V. Forrest, G. T. Forrest, S. J. Halse, E. C. Haskins, E. W. Hobkirk, A. G. Pite, E. W. Pugh, F. C. Thomson and S. Towse.

Mr. KEITH D. YOUNG then read the following paper on

The Sanitation of Hospitals and Infirmaries.

The question will no doubt have occurred to many of you, What is there in the sanitary conditions of a hospital which so differentiates it from an ordinary dwelling-house as to render it necessary or desirable to treat it as a subject in itself? The essentials of sanitation, a clean and dry site, substantial and dry walls, a roof that is weather-tight, and drainage and plumbing arrangements of sound construction and properly devised—surely these are as necessary to the smallest cottage as to the largest hospital. This is all perfectly true; but there are conditions affecting the health of the inmates of a hospital which are to be found in no other kind of building, and which lie at the root of all questions of hospital sanitation.

In the first place, then, it is essential that we should have a clear understanding of what a hospital is. Simple as this may appear, it is, nevertheless, the very root of the whole matter.

For our purpose to-night it will suffice if we divide hospitals into two classes:—1st, those which exist for the benefit of the patients; and 2nd, those which exist for the protection of the community. In the first class are comprised all those hospitals known broadly as general hospitals, including also the majority of special hospitals; and, in the second, hospitals for the treatment of infectious fevers.

In the first-class, then, we have a group of buildings which are devoted to the treatment of sick and injured poor—eleemosynary establishments, the first and most important function of which is charity. In these hospitals a large number of patients are gathered together, very often literally under one roof. Without such a grouping of large numbers of patients in one building or one group of buildings, it would be impossible to extend the benefits of medical and surgical relief to anything like the numbers of patients needing help, and as it is, the struggle for existence is, as you possibly know, hard enough. But the point to which I wish to draw your attention is this—that it is not to the advantage of the patients that they should be congregated together in large buildings or in large wards; but, on the contrary, this very fact is an element of grave danger to the patients themselves. To put the matter plainly, the ideal hospital is one in which each patient should be treated in a ward by himself, entirely cut off from all possibility of aerial connection with any other ward. This is, of course, an economic impossibility, and it is the function of hospital sanitation to combat the dangers involved by the necessity of grouping large numbers of sick together.

I cannot do better than quote to you words written just thirty years ago by Sir John Simon in a report on hospital hygiene to the Privy Council:—

"The rules of hospital hygiene are," he says, "in principle

simple enough. That which makes the healthiest house makes likewise the healthiest hospital—the same fastidious and universal cleanliness, the same never-ceasing vigilance against the thousand forms in which dirt may disguise itself, in air and soil and water, in walls and floors and ceilings, in dress and bedding and furniture, in pots and pans and pails, in sinks and drains and dustbins. It is but the same principle of management, but with immeasurably greater vigilance and skill, for the establishment which has to be kept in such exquisite perfection of cleanliness is an establishment which never rests from fouling itself; nor are there any products of its foulness—not even the least odorous of such products—which ought not to be regarded as poisons.”

To illustrate the truths of these propositions I will take two examples of hospitals which may serve as subject-lessons in hospital hygiene.

My first example is the famous old Hôtel Dieu at Paris; often as this remarkable, I might almost say unique, building has been described, I think the lessons to be learnt from its history are so valuable that I need not apologise for bringing it to your notice this evening.

I have here a plan of one floor of part of the Hôtel Dieu as it existed at the latter end of the eighteenth century. Howard, who visited this hospital in the year 1783, says of it and its auxiliary, the Hospital of St. Louis, that “they are the two worst hospitals I have ever visited. They were so crowded that formerly I have often seen five or six in one bed, and some of them dying.” Tenon, whose memoir on the hospitals of Paris was published in 1758, says, “In the middle are placed the most infectious departments, such as clothes stores, mortuaries, dissecting-rooms; they (*i.e.* the patients) are contained in four or five floors of wards joined together and without ventilation, wards surrounded by rooms for the staff which cool and shade them; where the staircases are insufficient; where the sole and only promenade is a place encumbered with drying-grounds and linen in course of evaporation; a monstrous pile, more fit to prolong sickness, to destroy, than to re-establish and preserve health.”

Look for a moment at the plan, with the vast ward running the whole length of the building, and containing 168 beds, of which 118 were for four patients each, giving a grand total of 572 patients, and then note that on the south side there are no windows at all, whilst on the north the windows must nearly all have had their eills above the ceilings of the adjacent rooms. This sort of thing was repeated on three upper floors with slight variations, and in addition to this building there were other wards on the opposite bank of the Seine, and on one of the bridges connecting the two sides.

The latrines were in close proximity to the wards, were insufficient in number, and are described by M. Tenon as masses of ordure, and the extent to which infection must penetrate the wards as inexpressible. Within the walls of this vast pest-house were gathered not only ordinary sick, but patients suffering from infectious and contagious diseases of all sorts, lying in women and lunatics. And the immediate result of this state of things was that one patient out of every four died. You have here, then, every defect by which the structure of a hospital can contribute to the destruction rather than the preservation of life.

My second example is the old Lincoln County Hospital. I have chosen this in order that I may contrast with it the building which replaced it, and which is still one of the best examples, twenty years old though it be, of a good county hospital.

In 1863, when this hospital was inspected by Mr. Timothy Holmes, he found that in consequence of a severe outbreak of erysipelas and other septic diseases, certain alterations had been made in the structure and its drainage, which, it was hoped, would remedy the evils referred to. The hospital itself he describes as a building of irregular structure, a great part of it being nearly a century old. Like most hospitals of that period it was “composed of small wards not so much ill-provided with window space as having their windows improvidently placed for hospital purposes, the windows being wide and low, and at one or at two contiguous ends of the ward, so that it became necessary to crowd the beds together away from the windows.” He notes also that in the older part of the hospital the floors were of plaster, than which a worse material for the purpose can scarcely be imagined. The hopes for the better future of the hospital expressed in Mr. Holmes’s report were doomed to disappointment, for in succeeding years the recurrence of pyæmia became so persistent that it was obvious that nothing short of demolition would suffice to root out the evil. Here again, there can be no doubt that the structure itself was to blame. The number of small ill-ventilated wards, all in intimate air connection with one another, was at the root of the difficulty. Septic disease does not spread about a hospital if the wards are properly separated one from the other and efficiently ventilated.

Contrast this with the plan of the present hospital, the work of my friend, Mr. Alexander Graham. Note the long and

narrow wards, each bed with its proper complement of light and air, the offices properly disconnected from the wards, the latter from the administrative offices, and the laundry and mortuary duly isolated from every other part.

Let us now take in order the various points which I have mentioned as tending to aggravate and intensify the necessary processes of fouling which must go on in all hospitals.

Insufficiency of air-space and insufficient ventilation are closely allied, and must be considered together. Air-space, indeed, is of little value by itself unless it is accompanied by ample means of ventilation. And by air-space I mean not only cubic space but floor space—a most important point to note. It is useless to supply your patients with a generous amount of cubic space unless you first see that they have sufficient floor area. Of the importance of free ventilation the experience of great wars is of the utmost value. A very striking case occurred during the Franco-German war—I believe in Paris—where it happened that a church and a slaughter-house were about the same time converted into wards for the reception of wounded soldiers. In the church gangrene broke out, and the mortality among the men was very heavy. In the slaughter-house, although the cubic space was many times less per man than in the church, the cases did well and septic disease was not seen.

The essential point of difference in the two buildings was this. The church was a solid building with windows high up in the walls and very little means of ventilation, whilst the slaughter-house was a mere shed, with louvre-boarded sides, freely swept with air from end to end. This point is further illustrated by the experience of hut hospitals, as compared with wards improvised in permanent buildings, as far back as the Crimean War and in the Civil War in America, which led many experienced surgeons to the conclusion that hospitals should always be temporary structures which should be destroyed at frequent intervals.

The question of ventilation cannot be considered apart from that of warming. The two are interdependent and cannot be separated.

Ventilation, then, means the supply of fresh air, warmed to the requisite temperature, and in sufficient volume to preserve a given standard of purity without producing draughts. The rule generally adopted in practice is that each patient should have a supply of 3,000 cubic feet of air per hour. This amount is requisite in order that the total impurity of the air may not exceed 6 per 1,000. To accomplish this without draught, the air of the ward should be changed not oftener than three times per hour, which gives a minimum allowance of cubic space of 1,000 feet per head. It is very difficult to lay down any fixed rules for determining the necessary allowance of cubic space. The nature of the disease treated and the situation of the hospital must be taken into consideration.

In a country hospital, where the cases are for the most part of a mild or chronic nature and the site is open, 1,000 feet may often suffice. Where the average of acute cases is greater and a hospital is in the centre of a big town, more cubic space is required; and in hospitals in manufacturing towns where severe surgical cases are frequent, I think 2,000 feet is not excessive. The tendency to draft off patients to convalescent hospitals as soon as they are fit to be removed, and so to keep the wards full of acute cases, is an element that must be taken into consideration nowadays.

Ventilation is commonly divided into two classes—natural ventilation and mechanical or artificial ventilation. In natural ventilation the agency of windows and other openings, aided by the upcast power of the smoke-flues from open grates is relied upon. In artificial ventilation the air is either pumped in by mechanical appliances and allowed to escape through openings or shafts constructed for the purpose, or it is sucked out either by fans or by the aspirating power of heated shafts. In either case the air must be warmed before it enters the ward.

It would be impossible for me to describe the many systems which have been devised for the ventilation of wards by mechanical means in the time we have at our disposal this evening. The object, however, of each is practically the same, namely, to insure a regular and automatic change of air in the ward by mechanical means, altogether independent of windows.

The question which concerns us is this, Is there any evidence to prove that wards cannot be kept sufficiently sweet and healthy without recourse to expensive automatic appliances? So far as the experience of hospitals in this country goes, I think that not only is there no such evidence, but that there is some very definite evidence in support of the exact converse. There is a case cited by Dr. Bristowe and Mr. Holmes in the report to which I have before alluded, which goes to prove that mechanical ventilation can become a positive evil. I allude to the York County Hospital, which, when it was erected, was furnished with an apparatus for warming and ventilating by a mechanical process, by which the air was warmed in the basement and driven into the wards by the aid of a steam-engine, the vitiated air being carried off by shafts

warmed by hot pipes. The wards were not provided with fireplaces, and the windows were mere apertures for light, and were not made to open. This system remained in work for nine years. During that time it was said that the wards were always close, sickly and even offensive; and erysipelas increased to such an extent and proved so often fatal, that the surgeons gave up operating altogether, preferring to abandon their patients to disease rather than risk operations with almost certainly fatal results. The system was abandoned, fireplaces constructed and windows made to open. When this was done erysipelas disappeared and the health of the hospital became what it ought to be.

No doubt in this case the apparatus itself was deficient. I give the case for what it is worth; but it is not without its value, if only to show how mischievous such a system can be if improperly devised.

To return to our question, Is artificial ventilation necessary? To prove that it is necessary we must assume that the ordinary means of ventilating by open windows is inadequate. Now, I venture to affirm that there is no evidence whatever in support of such an assumption. A distinguished Paris surgeon, Dr. Le Fort, in 1862 published a report on "Hospital Hygiene." He there compares the mortality in London hospitals with that of the Paris hospitals, very much to the disadvantage of the latter, and professes himself decidedly in favour of the natural means of ventilation adopted in London to the artificial systems in vogue in some Paris hospitals. But he says one need not go to England to search for means of comparison between the two systems; for the two hospitals in Paris where the mortality is greatest are precisely those in which artificial ventilation is employed. And this, remember, was at a time when antiseptic treatment was unknown, and the paramount importance of cleanliness was not recognised as it is to-day.

The matter appears to me to be very fairly stated by Sir Douglas Galton in his book on "Hospital Construction." "The system of propulsion for hospital ventilation (he writes) has not found general favour with hospital architects or managers in this country. There is one very patent and valid reason, which is that in this climate windows can be kept open; and when windows are open the volume of fresh air which passes through a ward will be at least twenty times greater than either the theoretical 3 000 cubic feet per hour, or even the 5,000 or 6,000 cubic feet, which some of these systems profess to furnish, without entailing the large expenditure of fuel necessary for moving a large volume of air."

So, also, Dr. Bristowe and Mr. Holmes, in the report to which I have already alluded. "No amount of cubic feet of space, no plan of building, no artificial system, no combination of these adjuncts to a good ventilation has ever been found to replace open doors, windows and fireplaces, while provided with the latter, which are the essentials of good ventilation, many old crowded defective hospitals have maintained for a long series of years an amount of success which the most eminent examples of scientific construction have never found practicable."

Every one who has any experience of hospitals in this country knows that there are very few days in the year during which ward windows cannot be kept open; and I cannot think it justifiable for the sake of those few days to establish a complicated system, involving a certain amount of skilled labour in working and considerable cost for maintenance; a system, moreover, which must involve the construction of a number of shafts, all of which, unless kept scrupulously clean, must become harbours for filth and a constant menace to the health of the patients.

If I were to presume to lay down rules for the proper method of warming and ventilating a ward, I should say apply your warmth, or the greater part of it, around the outside walls of the ward where the greatest leakage takes place; whether the method be by steam or hot water, take care that every pipe or coil is so placed that it can be cleaned easily and all round. If any arrangement is made for the admission of fresh air at the back of a coil, see that the shaft can be readily got at and cleaned, and let no shaft for the passage of air be longer than the thickness of the outside wall.

Before I leave this subject of ventilation there is one special point it is necessary to notice. This is the sterilisation of air from fever wards. There is one kind of fever, and one only, of which it can be said that the sterilisation of air expelled from the wards is necessary in the interests of public health, and that is small-pox, a disease of which we have convincing proof that it can and does spread beyond the walls of the hospital; that the specific infection of it is in fact air-borne. And for this reason it is distinctly desirable that some means should be devised for rendering innocuous the air from the wards. The nearest approach to the accomplishment of this task has been made at the Bradford Corporation Hospital, where, under the direction of the architects, Messrs. Morley & Woodhouse, an apparatus has been constructed and since patented by Mr. Edward Oldroyd. The system, to describe it very briefly, is this. Fresh air, capable of being warmed when necessary by

passing over hot-water pipes, is admitted to the wards in the floor at the foot of each bed, and also at certain points in the opposite wall. The whole of the vitiated air is drawn from the ward through openings at the ceiling level into a trench, at one end of which is a powerful furnace; part of this air is used to promote the combustion of the fire, the remainder being passed through the furnace and exposed to a temperature estimated to be 800 degs. Fahr. All the windows in the ward are hermetically sealed. For sufficient reasons I am not able to put before you any statistics as to the success of this system. The proof of success in an appliance of this kind is a matter for the bacteriologists and the microscope; and we have yet to see whether a ward constructed after this fashion fulfils every requirement, not only of the sterilisation of the air, but also as a suitable place for the treatment of small-pox. The point, however, I wish to impress upon you is that there is no justification whatever for applying such a system as this to wards for scarlatina, or any other infectious fever. The fact that scarlatina, the most important of these diseases, does not spread beyond the walls of the ward is well recognised; and this being so, the necessity for any system of sterilisation of air vanishes.

(To be concluded.)

TESSERÆ.

Stereotyped Architecture.

WHEN we reflect upon the many and great changes which not only two or three thousand years, but even the lapse of a single century, will effect in the condition and circumstances of society, it is by no means surprising that in an art, the excellence of which from age to age is so largely affected by these ever-varying contingencies, that that which is justly entitled to the palm of excellence in one age or country, should be found totally inefficient and inconsistent in another. The architects of ancient Egypt, for example, found the required sites for their temples exposed to frequent inundations from the annual overflowings of the Nile. Hence the massive and broadly spreading bases which gave solidity; and, under such circumstances, imparted effective beauty to their structures. The originators of the Grecian architectures, on the contrary, had very high and dry and hot situations to adapt their arrangements to; and as rain seldom falls in Greece they were enabled to dispense with windows or other means of light and ventilation to their temples, by leaving large central openings in the roof. The purpose of their porticos and colonnades, in addition to presenting a grand and imposing relief to the monotony of bare and unperforated walls, was unquestionably to protect the edifice and its congregations from the piercing effects of the sun, which on a naked rock of some hundred feet above the common level, and in a climate such as that of Athens, is peculiarly oppressive. The ancient Romans also, together with the modern Italians as well as the originators of Gothic architecture, claim—certainly in different degrees but nevertheless justly claim—the merit of adapting their successive modifications of the art of construction to the altered circumstances of the times and to differences of climate as well as to differences of materials. And how, it may be asked, can we in the nineteenth century really imitate the example of these ancients but by striving to do not what they did—but by the actual and servile copying of their forms—but as they did, by the invention and working out of forms and arrangements adapted to the different character of our own climate and the altered condition of our own times? So long as adherence to antique forms is persisted in, it is utterly impossible that architecture can be brought to any satisfactory result in England and Europe generally, the very nature and character of these forms being totally at variance with many of the most prominent and essential arrangements of modern society.

Leonardo da Vinci.

Viewing Da Vinci as a philosophic student, as a votary of pleasure, as an athletic civilian, as an aspiring artist, or as a man of Catholic tastes and boundless capacities, we must ever regard him as a splendid phenomenon. And a phenomenon he unquestionably was, if for nothing else for the dazzling but harmonious contradictions of his character. Perhaps no other man, either before or since, ever combined so intimately and yet with such an exquisite preservation of individuality the incongruous attributes of the natural and the artificial. Such was his appreciation of the purely natural that he could paint a blossom spangled with the dew of morning (as he has done in one of his Madonnas), so that you would mistake for a reality both bloom and moisture. Yet he disdained not to participate in the frivolities of fashion and the coteries; he could dally over a brodered glove, and discern beauties in the texture of a jewelled tissue. Osric might have found sympathy in him for all the punctilios of etiquette, and yet he might have lamented for the flowers of Proserpine with an

earnest tenderness like that of Perdita. His whole soul was a living antithesis of predilections—verging in one direction towards the city and the palace, and in another towards the woods and the wilderness—singing pæans to the society of the gay and the *débonnaire* with Catullus, and exclaiming, in his rapt admiration of nature, as the American philosopher has since exclaimed, with a voice awe-stricken and yet exultant—“Every day, the sun; and, after sunset, night and the stars: ever the wind blows; ever the grass grows.” Such was Leonardo when he wandered by the ripples of Fucecchio, or frittered away his leisure in the saloons of Florence. A child, with all the poetry of childhood, when he was in the meadows of Bergamo; he was a gentleman, if not a *petit-maitre*, and a worldling, when mingled amidst the throng of courtiers in the palace of Tuscany. It is this contrariety of sentiment and bearing which imparts so much of zest and fascination to his memory, investing it with the double graces culled from nature and civilisation; it is this which constitutes the originality of his idiosyncrasy, colouring it with a variable splendour of antitheses, like the sheen which fluctuates on the plumage of those oriental birds described by the ornithologist as “damson-hued and silver, according to the variations of light.” And precisely as the light of circumstances shone upon Leonardo’s temperament, were the contrasting shades of that temperament revealed. At a pageant he was a musician or a necromancer; at a conclave an orator or a philosopher. Whenever any one faculty was calculated to be most effective that faculty was at once, by a sort of admirable fatality, developed by the Florentine. Nor did these sudden transformations arise from any inherent inconsistency in his principles; they originated, on the contrary, in the marvellous flexibility and elasticity of his genius—a genius which adapted itself to every emergency, which obeyed every demand, and which only succumbed at last under the pressure of physical prostration.

Manufactures in Brass.

Brass is composed of copper and spelter, varying in its composition according to the purpose to which it is intended to be applied; when melted it runs with facility into sand-moulds; when cast into ingots it can readily be rolled into sheets, drawn into wire, formed into tubes, pressed into the most complicated forms; can be filed and turned, bronzed or cleaned by acids. Moulding is employed to produce the article in its rough state, and may be said to be the first stage of the work; previous to this, however, the pattern has to be made, and if an ornamental one the aid of a designer, modeller and chaser will be required; he first makes a drawing, the second a facsimile in wax, which is cast in lead, and committed to the hands of a chaser, who repairs it, and having a cast made in brass puts in all the details. This is then sent to the moulder, with a box formed in two parts, which he separates, and one-half of which he places with the face downwards upon a board. If the pattern is flat he lays it in, and after riddling sand upon it, fills up the remainder, pressing it hard down. Having scraped off the sand which is not required from the top of the box, and introducing another board, he reverses the same; having dusted the face he places the other half of the box on the top and repeats the operation of filling with sand. This done the two parts are separated, the pattern or model removed, a “gate” made for the introduction of the melted metal. The box is then closed, held together with screws or clamps, and the metal which has been melted in an air furnace and in a clay crucible is poured down into holes of the box, and fills every portion of space left unoccupied, thereby producing a perfect copy of the model. Holes are cast into articles by the introduction of pieces of sand, technically called “cores.” The casting is now placed in the hands of the workman; if round it is turned in the lathe, if square or flat it is filed, if an elaboration of detail, such as leafage, figures, &c., it is rifled and chased up. The appearance of dead gold is given by immersion in acid; the bright portions by means of steel tools or burnishers; and the final touch or operation is the protection from tarnish or oxidation, by means of lac varnish, which is applied with a camel-hair brush, the article having been previously heated. Bronzing is the result of the action of an acid, and its colour or shade is determined by the varnish employed as a protection, the article having previously been brushed up with black lead.

The Pergamene School of Sculpture.

Three lines of Pliny and five of Pausanias constitute the whole of what the ancient writers have to tell us about the school of sculpture of Pergamum. “Many artists,” says Pliny, sculptured the battles of Attalus and Eumenes against the Gauls.” Pausanias tells us of a trophy set up by Attalus I. on the Athenian Acropolis, with representations of the battles of the Gods and Giants and the Athenians and Amazons, of the fight at Marathon, and of his own victory over the Gauls; the figures two cubits high. Until quite recently it was not known that we had sculptures of the Pergamene school, and it was debated whether the *anathema* of Attalus consisted of reliefs or of detached figures. The learned Raoul-Rochette first showed

that the group called Paetus and Arria in the Ludovisi Gallery at Rome represented a Gaul slaying his wife and himself, to save himself and her from captivity, a group which would be a likely subject for a sculptor of the court of Attalus. Then it was seen how similar in style and idea to this group is the figure formerly called the dying gladiator of the Capitol, and now known as the dying Gaul. Professor Heinrich Brunn made a special study of these sculptures, and was able from them alone to form some idea of the Pergamene style of sculpture. Then by the light of that knowledge he advanced to a most brilliant and happy discovery. He found in several of the museums of Europe—at Venice, Naples, the Vatican, the Louvre—small statues of overthrown and wounded combatants. The style of these sculptures is the free and advanced style of the period after Alexander, their size corresponds with the words of Pausanias, their treatment is like the treatment of the dying Gaul of the Capitol. Putting all these detached statues together, some of which had failed to attract attention, while others had been pronounced modern, Professor Brunn was able to prove that we have in them remains of the groups of combatants from the trophy of Attalus at Athens, and even representatives of the defeated party in every group, of Giants, Amazons, Persians and Gauls. When this had once been proved, our knowledge of the history of ancient art received an enormous accession, and a view was given us of the state of art and manners in Asia Minor under the Pergamene princes. If Professor Brunn’s theory required verification like other scientific theories, it would certainly have received it when there were discovered at Pergamum itself, and taken to Berlin, the sculptures of a gigantic altar, sculptures which in style bear the closest likeness to the scattered figures of Giants and Gauls brought together by Brunn.

Mythological Sculpture.

Lord Byron in his “Childe Harold,” describing the Venus de Medicis, asks the goddess whether she appeared in “this guise” to Paris or to “more deeply blessed Anchises,” or to Mars more fortunate still; and then follows a rhapsody about “lava-kisses, melting while they burn,” showered on the cheek of the recumbent war-god. Such a group would hardly have suggested itself to the imagination of a Greek sculptor about to embody a Phedra, and is in strange contrast with the Venus of the Florentine Tribune, that beautiful and passionless impersonation of the morning star. Elaborate blunders in a case of this kind are the less pardonable, because it is especially through the interpretation of Greek art that the several characters of Greek divinities are to be distinguished. We require no allusive attribute, neither quivered shoulder nor crescented brow to recognise a Dian in those feet, firm and alert, though for the moment arrested, that slender but sinewy form, and above all, the far-projected Apollonian glance clear as the beams of the sister luminary embodied. With the form, equally girlish but simply joyous and blameless, of a Hebe or a Grace, such a divinity was almost as strikingly contrasted as with a Pallas, a goddess chaste as the Huntress that outsped the shafts of Love, but chaste from the collected sternness of self-sufficing strength and from the high wisdom, confederate with virtue, which subdued the presuming with its Gorgon and presided over every industrious art. The character of a Venus was expressed not less plainly in early ages of art by the union of perfect beauty with a reserve and sacredness which belongs to the maternal relation, and in later by the languishing and humid eye, the lips enwreathed with smiles and dubious look, the narrow shoulders, the marvellously-moulded form, slightly developed and yet luxuriant, in which numberless and incalculable curves were lost in one another, and finally by the slender feet and the tread, at once confiding and insecure, apparently accustomed to a more unstable element than earth. The genius of a nation’s poetry will ever be exhibited in its other arts—at least, in those it cultivates, as the latent spirit of its philosophy is disclosed in its laws.

The Chemistry of Oil-Painting.

The study of the attractions already fully developed in pictures painted within the last hundred years only, and their comparison with the works of the old masters, would suggest the following rules for the process of painting:—(1) The oil should in all colours be reduced to a minimum and under no form should more of it than absolutely necessary be introduced into a picture. (2) All transparent colours which dry very slowly should be ground not with oil at all, but with a resinous vehicle. (3) No colour should be put on any part of a picture which is not yet perfectly dry; and above all, never a quick-drying colour upon a slowly-drying one which is not yet perfectly dry. (4) White and other quick-drying opaque colours may be put on quickly. On the contrary, transparent and slowly-drying colours should always be put on in thin layers. If the effect of a thick layer of these latter is required it must be produced by laying one thin layer over another, taking care to have one completely dry before the next is laid on. If transparent colours are mixed with sufficient quantity of white lead they may be treated like opaque ones.

NOTES AND COMMENTS.

ON Saturday last the cemetery of Père-Lachaise was enriched by the costly monument which is the memorial of the late M. BARBEDIEENNE, a founder, who did more than any of his contemporaries to popularise sculpture. The bronzes which he had produced were taken from the antique Renaissance examples, as well as from the best works of the modern French sculptors, and by the aid of the process devised by ACHILLE COLLAS were reproduced with the utmost fidelity. Cheaper bronzes than BARBEDIEENNE'S are to be easily obtained in Paris, and, judging by what takes place in international exhibitions, they are preferred on that account by princes and nobles, but for all amateurs who are worthy of the name BARBEDIEENNE'S series is the most satisfactory. Although the numerous reductions have given character to the house, it must not be supposed that BARBEDIEENNE'S operations were restricted to them. Many of the largest bronze statues in France and other countries came from his foundry, and at the time of the siege he produced a great many cannon. Decorative bronzes, such as lustres, clocks, girandoles, &c., were also manufactured, and the style was always faultless, one reason being the constant employment of an architect among the superintendents of the firm.

As many of our readers are aware, the pavement of the cathedral at Amiens has for years continued in a most defective condition. Partial repairs would be of little advantage, and the cost of a general repaving, which would be at least 4,000*l.*, has hitherto scared the authorities. The latter work is at length to be undertaken during the winter. The Bishop of the diocese has obtained contributions from several individuals, and the Government have consented to give a grant in aid. The stone employed will be "grès de Marquise" and "grès de Belgique." The paving will be a tedious operation, especially as it is intended to reproduce all the memorial inscriptions which are found on the broken slabs.

THE excavation of the Parliament Hill tumulus has been as unprofitable as many other undertakings of the County Council, and we hope the result will convey the lesson that interference with ancient things is not always advantageous. At Highgate the outlay fortunately was moderate, for Mr. C. H. READ, who directed the excavations, is not to be paid. His conclusions about the tumulus are as follows:—(a) That it is without question an artificial mound, raised at a spot where there was originally a slight rise in the ground. (b) That a great quantity of additional material was added to it, chiefly on the northern and eastern sides, and probably within the last two centuries. (c) That the tumulus has not been opened before. (d) That it is very probably an ancient British burial mound of the early Bronze period, and therefore centuries before the Christian era. The burial was probably by inhumation, and the bones have entirely disappeared—a circumstance by no means uncommon. Canon GREENWELL, who has directed several operations of a similar class, agrees with Mr. READ. The origin of the name Parliament Hill, or, as some people designate it, Traitors' Hill, seems to be as far as ever from discovery.

FATE seems to be inimical to the erection of a statue of BALZAC, the novelist, in Paris. It will be remembered that when the project was announced there was only a tardy and illiberal response, for the sum received amounted to only 26,000 francs. A further sum of 10,000 francs was promised when the statue was set up. The whole arrangements were entrusted to the Société des Gens de Lettres. They confided the commission, in October, 1888, to M. CHAPU, the sculptor, and allowed him 5,000 francs on account. He promised to deliver the work in eighteen months. M. CHAPU fell ill, and when he died, in April, 1891, the model could not be utilised. The Société gave another thousand francs to his family as a sort of compensation for withdrawing the commission. M. RODIN was next selected, who received 5,000 francs with the commission and engaged to deliver the statue in eighteen months—that is, on January 6, 1893. Another instalment of 5,000 francs was granted when applied for. M. RODIN in due course submitted a model

which was not considered satisfactory. He is a realist, and as BALZAC'S figure was not of a heroic sort, being rotund and heavy, it would be contrary to the sculptor's principles to represent the novelist as a sort of APOLLO. The members of the Société were disappointed. M. RODIN endeavoured to alter his model, but as his theory of art was at stake he could not go far. In seeking M. RODIN, it was natural to suppose that what was desired was a portrait of BALZAC as he appeared to his contemporaries, and not an attempt to create an ideal. The sculptor was not satisfied with his changes, and in the hope that time might bring a solution he asked for a postponement until the middle of 1895. The Société acceded, but on condition that M. RODIN returned the 10,000 francs. The sculptor had no objection, but some of his friends have persuaded him that the demand was unwarranted, and must not be complied with unless under conditions which will give a litigious character to the transaction. What may happen nobody can foresee. The case almost corresponds with that of the Wellington Memorial. The Société must have known all about M. RODIN'S work, and might easily have imagined the kind of figure he would produce. A sculptor of his eminence cannot be expected to adapt his work to suit all tastes, and accordingly it does not seem worthy on the part of a Society of Authors to imitate the conduct of the late Mr. AYRTON, by considering only the financial aspect of the case.

WITH all their disciplinary power the Germans do not appear to be better able to conduct competitions without failure than we are in England. A case which has just occurred in Mayence exemplifies inherent defects in the system, which, if they are surprising to the people of that pleasant city, are familiar in other places. It was decided to erect an Evangelical church at a cost of 700,000 marks, and as several of the leading ecclesiastical architects in Germany were anxious to obtain the commission, a competition was arranged. The church authorities and their advisers then found themselves in a difficulty. Excellent designs were sent in, but none of them could be carried out for the prescribed sum. Accordingly it was decided that the first prize could not be awarded nor one of the designs adopted. It was proposed to award prizes of 1,500 marks to Professor OTZEN, of Berlin, and Herr KREYSSIG, of Mayence, and to recommend that the designs by Herr SCHWECHTEN, of Berlin, and of Herr SCHWARTZ, of Darmstadt, should be purchased. Herr SCHWECHTEN, however, declined to agree to the proposal, and withdrew his plans. The next act of the church authorities was to write to the three architects, Herren OTZEN, KREYSSIG and SCHWARTZ, asking them if they were prepared to alter their plans to correspond with an outlay of 700,000 marks, and if they could refer to buildings they designed which cost that sum. In other words, they are invited to take part in a second competition for which no prizes are offered.

THE late HENRY ROE was only a distiller, and of late years was not one of the wealthiest, but his death deserves respectful record in a journal that treats of architecture. It is not often a man is found who is willing to expend about 200,000*l.* on the restoration of a church which was used by few people. That was Mr. ROE'S claim to recognition. A brewer having expended a large sum on the renewing of one of the Dublin cathedrals, Mr. ROE was incited to undertake a similar obligation for its companion. He acted with more discretion, for while St. Patrick's lost most of its characteristics through the operations which Alderman GUINNESS paid for, Mr. ROE, by entrusting the restoration of Christ Church to the late Mr. STREET, enabled as satisfactory a restoration to be accomplished as was possible. He had also a chapter-house provided, and the buildings form the most picturesque group in Dublin. It is not impossible that Mr. ROE in his zeal over-estimated his own resources. The buildings were scarcely completed, and a costly record of the work brought out, when it was discovered that the withdrawal of such large sums was an embarrassment for his business. Mr. ROE was compelled to make many sacrifices, and he may be allowed the privilege of being numbered among the martyrs for architecture.

THURLAND CASTLE, KIRKBY LONSDALE.

BISHOPSGATE INSTITUTE.

THE buildings, comprising hall, library, reading-room, board-room, offices and caretaker's house, which were opened on Saturday last, have been designed by Mr. C. HARRISON TOWNSEND and erected by Messrs. JOHN MOWLEM & Co., Mr. THOMAS LEE acting as clerk of the works. The elevation of the principal entrance (in Bishopsgate Street) has been carried out in light yellow terra-cotta, supplied by Messrs. GIBBS & CANNING, of Tamworth, the modelled work having been executed by Mr. AUMONIER. Above this entrance are the board-room and the clerk's offices.

The Institute has also side and back entrances in Brushfield Street and Duke Street, the frontages of which have been carried out in red brick with dressings of terra-cotta.

For general access a corridor runs the whole length of the buildings, and to insure perfect quiet and convenience to the public the library and reading-rooms have been placed as far as possible from the traffic of Bishopsgate Street, and are also cut off from the hall by another corridor. The corridors and staircases have been lined with glazed tiles by Messrs. MAW & Co.

The floors of the corridors and vestibules are of marble mosaic set in red cement and laid by Messrs. MAINZER & FARRER. The floors of the library and hall are laid with GODDARD'S patent oak block flooring and are of fireproof construction, upon Messrs. HOMAN & ROGERS'S system.

The stairs to the library and board-room are of solid teak. The hall, 80 feet long, 48 feet wide and 42 feet high, will seat about 500 people. The exit doors, 10 feet wide each, open immediately into thoroughfares, and are so arranged that the whole audience could, in case of panic, easily quit the building within two or three minutes. In addition to the high clerestory windows, a toplight is provided with a view to the hall being occasionally used for exhibitions of paintings, &c. The platform is provided with ample means of exit and with dressing-rooms and other accommodation. Space has also been provided at the back of the platform for an organ, to be blown by hydraulic power.

The lending library, director's room and reference library on the ground floor are 15 feet 6 inches high. The height of the reading-room on the first floor is 15 feet. The basement is very commodious and well ventilated.

The gas-fittings throughout the building have been supplied by Messrs. SUGG & Co., of Westminster.

The foundations are in concrete, carried down to the natural gravel, and the outer area and basement walls are constructed of solid brickwork, faced on the exterior with Seyssel asphalt. In excavating the site a number of interesting curiosities were discovered at a depth of about 15 feet from the ground level. These comprise coins, bones, a skull and specimens of pottery of the Elizabethan and other periods.

Like the other institutions which the Rev. WILLIAM RODGERS has promoted, the Institute has special characteristics, and we have no doubt it will also be a memorial not only of his energy and benevolence but of his farsightedness.

NEW PRESBYTERIAN CHURCH, HEATHFIELD ROAD, BIRMINGHAM.

THIS building is about to be erected on the Heathfield Estate, Handsworth. The seating accommodation is about 400. In addition to the rooms shown on the sketch plan, there is choir vestry, kitchen and heating chamber.

The exterior will be faced with red bricks with Hollington stone dressings, the internal dressings being of Bath stone. The roofs are covered with best pressed red tiles.

The architect is Mr. JOHN P. OSBORNE, F.R.I.B.A., of Birmingham.

SOCIETY OF ARCHITECTS.

AT the ordinary meeting of the Society of Architects, held on November 27, Mr. E. J. Hamilton, president, in the chair, Mr. Ellis Marsland read the following paper on

The London Building Act of 1894.

Mr. MARSLAND said:—Since I last had the honour of addressing you upon London building law, the Bill promoted by the London County Council, which was then the subject of my paper, has passed into an Act, and comes into operation on January 1, 1895. This has been done at a vast expenditure of time and money, and the opposition which it encountered in its progress through both Houses of Parliament has shorn it of a great number of its progressive or, as some would have it, objectionable features.

One hears on all sides a considerable amount of gratification on the part of the various bodies who actively opposed the Bill at the success of their opposition in securing that their particular views were either added to the Act or some objectionable clause struck out; but it appears to me that if all these opposing forces are viewing their endeavours with such mutual satisfaction, we have now either a very perfect measure or a case of too many cooks. This, of course, remains to be seen. We as a Society, although we did not actively oppose the Bill, have every reason to be satisfied with the result of the suggestions for amendment made to the London County Council, there being scarcely one which has not been incorporated.

If we look at the Act simply as one of consolidation it will be of immense advantage; there is, however, a good deal of fresh matter, and considerable changes will be caused in the carrying out of building operations both to the builder and architect. The object of my paper this evening is to point out the more important variations from the old law.

It will of course be impossible in the limited time at my disposal this evening to go through the whole of the new Act, so that I must necessarily presume that most of those present have an acquaintance with the present Act so much of which is incorporated with the new, and it is my intention to point out only the new sections and subsection which will affect us as architects.

The Act is divided into sixteen parts:—(1) Introductory. (2) Formation and widening of streets. (3) Lines of building frontage. (4) Naming and numbering of streets. (5) Open spaces about buildings and height of buildings. (6) Construction of buildings. (7) Special and temporary buildings and wooden structures. (8) Rights of building and adjoining owners. (9) Dangerous and neglected structures. (10) Dangerous and noxious businesses. (11) Dwelling-houses on low-lying land. (12) Sky-signs. (13) Superintending architect and district surveyors. (14) By-laws. (15) Legal proceedings. (16) Miscellaneous.

There are four schedules:—The first dealing with the construction and thickness of walls; the second detailing what are deemed to be fire-resisting materials; the third being a list of fees payable to district surveyors and the Council; the fourth containing a list of the repealed Acts.

In Part I. I would like to draw attention to some of the definitions in section 5. The number is considerably increased.

The expression "new building" means and includes: (1) Any building erected after the commencement of the Act; (2) any building which has been taken down for more than one-half of its cubical extent, and re-erected or commenced to be re-erected, wholly or partially, on the same site after the commencement of this Act; (3) any space between walls and buildings which is roofed, or commenced to be roofed, after the commencement of this Act.

It is important to bear this in mind, as should you desire to cover a space bounded on three sides by old buildings, you will have to ascertain that these walls meet the requirements of the Act and by-laws as to their thickness, foundation and damp-course. An alteration or addition to a building is brought within the operations of the Act by section 209.

The definition of a public building has been amplified, and includes an hotel, lodging-house, home, refuge, or shelter. If the building is of greater capacity than 250,000 cubic feet, or has sleeping accommodation for more than one hundred persons, this latter clause will be somewhat difficult to interpret, as with only 100 beds the corridors, passages and landings, and flights of stairs need be only of wood, but with an additional bed, or with a double bed in place of a single one, the whole character of the building is changed, and what with 100 beds could be constructed of wood, would with 101 beds have to be constructed of fire-resisting material under section 68. The district surveyor would have to make a periodical visit to enumerate the sleeping accommodation, which possibly might be a somewhat difficult, not to say delicate, task, as under section 206:—Any building, structure or work in any respect exempt from the operation of the Act or in any manner privileged in respect of any provision of this Act shall remain so exempt or privileged, so long only

as it is used for the purpose or retains the character by reason whereof it is so exempt or privileged.

Part II. of the Act, which deals with the formation and widening of streets and the position of new buildings with reference to streets, is mostly new matter.

New roads or streets cannot now be formed or ways adapted either for carriage traffic or foot traffic without first applying to the Council, the application to be accompanied by plans and sections and such other particulars as the Council may require.

The Council may refuse to sanction the plans in the case of a new road or street upon the following grounds:—

1. Where it is not 40 feet wide, if for carriage traffic.
2. Where it is not 20 feet wide, if for foot traffic.
3. Where it is not open at both ends.
4. Where it does not form direct communication between two streets.

5. Where it appears that a street proposed for foot traffic only should be used for carriage traffic as well.

6. Where a street has an unsuitable gradient.

7. Where a street is not in conformity with the by-laws.

And in the case of an adapted road for carriage or foot traffic upon the following grounds:—

1. Where houses or forecourts come within 20 feet of the centre, if the way is to be used for carriage traffic.

2. Where a road for foot traffic only is not widened to the full width of 20 feet.

3. Where such widening would result in the formation of a street not being open at both ends.

4. Where such widening would result in the formation of a street not affording direct communication between two streets.

5. Where it is proposed to widen a street for foot traffic only, and it appears to the Council that it would be better to widen it for carriage traffic as well.

6. Where the widening would result in an unsuitable gradient.

7. Where any of the Council's by-laws would be contravened.

The Council are bound, however, to answer your application within two months, and if they refuse must state fully all their reasons for such refusal.

The Council also, if they deem it expedient in the public interest and after notice of their intention to the local authority, may direct that a street, if not within two miles of St. Paul's Cathedral, shall be of a greater width than 40 feet up to 60 feet, or a street may be widened more than the prescribed distance from the centre up to 30 feet, provided that they pay to the owner compensation for the loss or injury sustained by him by such requirement. The position of new buildings or the forecourts of new buildings in old streets being highways is limited to the prescribed distance from the centre of the roadway except by sanction of the Council, but the prescribed distance may also be increased up to 30 feet provided that the owner is paid compensation for any land given up above 20 feet.

If, however, an old building abuts upon a street and the frontage comes within the prescribed distance, and it is desired to rebuild it, correct plans of the old building must be drawn and certified as correct by the district surveyor, and thereupon the site of the old building may be occupied by the new to the same extent but no more; if, however, this is not done the new building must be set back. There is one exception, and that is that no dwelling-house to be inhabited by persons of the working class shall, without the consent of the Council, be erected or re-erected within the prescribed distance to a height exceeding the width of the street, and that no building or structure shall be converted into such dwelling-house within the prescribed distance so as to exceed such height.

This section, however, does not affect the frontage of buildings erected on any private road or way (not being a highway), but it must be borne in mind that if at any time it is desired to convert such a road into a highway, it cannot be done except all projections within the prescribed distance and erected after 1878 are set back. It should be noted that some of these restrictions do not apply to the City.

In Part III., dealing with lines of building frontage, the old rule is maintained that no building or structure is to be erected beyond the general line of buildings in any street without the consent of the Council. Such general line of buildings to be defined by the superintending architect, who is to issue his certificate within one month of the application, and whose decision may be brought before the tribunal of appeal. You are not, however, prevented from advancing your frontage line without consent to within 50 feet of the highway if your forecourt in front exceeds this distance; but if by so doing you interfere with your neighbours' light and air, he has his ordinary common law remedy.

The Council, in giving their consent to any projection beyond the line of frontage, have power to attach certain conditions as to giving up land to be left open for the public use or the particular use to which the projection is to be put, and generally any other condition which they may deem it expedient to impose in the public interest.

The superintending architect is also to determine in any doubtful cases in what street any particular building or structure is situate, and which is the front and rear of buildings; but any person feeling aggrieved at his decision may appeal to the tribunal of appeal.

It is also necessary to bear in mind that the whole of this Part III. of the Act does not apply within the City.

Part IV. of the Act dealing with the naming and numbering of streets is not of much interest to architects, and may be passed over.

Parts V. and VI. I propose to group together under three heads, viz.:—1. Additional open space, light, air, and ventilation about buildings and other considerations of health. 2. Additional means of safety from fire and panic. 3. Additional structural requirements.

The clauses relating to the open spaces about domestic buildings are the most complicated and important of any in the new Act.

But if we bear in mind that there are three classes of conditions under which the open space is to be provided, it will help us considerably to a correct understanding of these sections.

Firstly, there is the open space to be provided to a domestic building erected after the commencement of the Act, and abutting upon a street formed after the commencement of the Act, *i.e.* a new site and a new road.

Secondly, there is the open space to be provided to domestic buildings erected after the commencement of the Act on sites not hitherto built upon, but abutting upon a street laid out before the commencement of the Act, *i.e.* a new site and an old road.

Thirdly, there is the open space required upon the sites of old buildings abutting upon old streets, *i.e.* an old site and an old road.

Under each of these three heads we have a preliminary requirement of 100 square feet for light and air to any habitable basement which is to exclusively belong thereto, and be free from any erection thereon above the level of the adjoining pavement, which open space need not necessarily adjoin the rear boundary of the premises.

Under the first of these conditions, *i.e.* a new site and a new road, the following additional open space in rear is required (provided the site is not a corner one or has a road in rear), viz. 150 square feet, which is to be provided at the adjoining pavement level and free from any erection, except a water-closet and receptacle for ashes; if, however, the ground storey is not constructed or adapted to be inhabited, the open space may be at the level of the ceiling of the ground storey or a level of 16 feet above the level of the adjoining pavement. This is to allow a shop to extend over the whole of the ground storey.

This open space is to extend throughout the entire width and to a depth in every part of at least 10 feet, so that you see in a 20 feet frontage the minimum space would be 200 square feet.

The height also of the building in rear in relation to the space is to be determined as follows:—

A horizontal line is to be drawn at right angles to the roadway at the pavement level to the rear boundary of the site.

At this point a diagonal line is to be drawn at an angle of 63½ degs., and no part of the building is to extend above the diagonal line except chimneys, dormers, gables, turrets or other architectural ornaments, aggregating in all to not more than one-third of the rear elevation of such building.

There are other subsections, dealing with cases where the front line of the site is not level, or where the site inclines towards the roadway, or where the building site is so irregular in shape that a doubt arises as to how the measurement is to be taken. In this latter case application is to be made to the Council, and if the applicant is dissatisfied he may appeal to the tribunal.

Where the land in rear of any such building abuts upon a street or public space no open space in rear need be provided, and the diagonal line may start from the centre of the roadway or at the further boundary of the public space.

In the case of a building on a corner site abutting upon two streets, or upon a street on one side and a public space 40 feet wide on the other, the Council may permit, upon application to them, the erection of buildings not exceeding 30 feet high upon such part of the space in rear as they may think fit, provided that the Council is satisfied that such buildings shall be so placed as not to interfere unduly with the access of light and air to neighbouring buildings. The applicant, however, if dissatisfied with the decision of the Council, may appeal to the tribunal.

The return front of a corner site is allowed to be the full height of the front elevation for a distance of 40 feet.

Any exceptional case, owing to the irregular shape of the land preventing the provisions of this section being applied, are to be dealt with by the Council, and if the applicant is dissatisfied he may appeal to the tribunal.

In the case of a domestic building and a stable in rear, the

front of the domestic building being upon a street and the front of the stable upon a mews, and the depth of the site not more than 150 feet, the stable may be 50 feet deep and 25 feet high, and the open space may be provided between the stable and the house—the diagonal line may start from the centre of the mews.

Houses abutting upon the river Thames or a public park, or on a public space of not less than 80 feet, do not come under this section.

Under the second of these conditions, *i.e.*, a new site and in old road, the open space is determined in the same manner as previously explained, but the diagonal line is to start 16 feet above the level of the adjoining pavement instead of at the level of the same (except in the case of dwelling-houses to be inhabited by persons of the working class).

There is, however, an important modification of the rule with reference to buildings not being allowed to extend above the diagonal line. It is this. Any part of any domestic building may extend above the diagonal line provided the Council shall be satisfied that an open cubic space of air will be provided at the rear equivalent to the open cubic space which section 41 provides; but it is open to this objection, that you cannot adopt it without the sanction of the Council, and if you are dissatisfied with their decision you have to go to the tribunal.

Under the third class of conditions, *viz.* old site on old roads, it is important to note that before commencing to erect a new domestic building you have to prepare plans, showing the extent of the previously existing domestic building in its several parts, and to submit them to the district surveyor, who is to certify the same under his hand.

You may then erect the intended domestic building, but so that no more land shall be occupied by the new building than was occupied by the previously existing building. If you do not submit plans as I have described, you are to be bound by the provisions hereinbefore mentioned. If, however, you wish to deviate from such old plans you must apply to the Council, and, if dissatisfied with their decision, go to the tribunal.

I should also like to draw your attention to section 42, which deals with the open space to be provided to dwelling-houses to be inhabited or adapted to be inhabited by persons of the working class, not abutting upon a street.

Before you can commence the erection of such buildings you must deposit at the County Hall complete plans of the same; then you have to wait one month, and if in the meantime the Council offer no objection to them you may proceed. If, however, the Council refuse to sanction them, or sanction them subject to certain modifications, you must submit or go to the tribunal of appeal.

The Council, however, cannot refuse their sanction if the plans show as much open space as would be provided if the buildings abutted upon an old street.

Under section 44, should you desire to rearrange a cleared area previously occupied in whole or in part by buildings, and to form, lay out, or widen streets thereon, you have to apply to the Council and submit your plans, and the Council may, if they, under all the circumstances of the case, think it desirable, modify or relax any of the before-mentioned provisions as to open space.

If they disapprove of the plans, they must say so within two months, and if they do not you can proceed.

If they disapprove, and you are dissatisfied, you can appeal to the tribunal.

The section relating to courts within a building for light, air and ventilation is divided into two parts, *viz.*, courts enclosed on all sides and courts enclosed on all sides except one.

If a court is enclosed on all sides, and its depth to the ceiling of the ground storey exceeds its length or breadth, adequate provision must be made and maintained by the owner for the ventilation of such court by means of a communication between the lower end of the court and the outer air. The expression "adequate" is rather vague, and it does not appear who is to decide as to what is considered adequate, and there is no reference to the tribunal of appeal in this section.

No habitable room is to be lighted and ventilated into a court enclosed on all sides, unless the width of the court is equal to half its height. The height is to be measured from the sill of the window to the eaves or top of the parapet of the opposite wall. It is somewhat uncertain whether it is the vertical line which is to be taken in measuring the height or the diagonal line, as the section states from the window-sill to the eaves or top of the parapet of the opposite wall.

A court enclosed on all sides can be made oblong in shape if it contains as much superficial area as a square one, provided the length is not greater than twice the breadth.

Courts enclosed on all sides except one, and the length being greater than the width, cannot have the window of an habitable room lighted into it unless the distance from the window to the opposite wall is equal to half the height of such wall measured from the window sill.

Every habitable room must now open into the external air,

and the size of the window or windows in such habitable room is to be equal to one-tenth of the floor space, half of which is to be made to open. Habitable rooms may, however, be lighted by a skylight or dormer, and in that case the window is to equal one-twelfth of the floor space, half of which is to open.

Staircases in tenement houses must be ventilated upon every storey above the ground storey by means of windows or skylights opening directly into the external air, or shall be otherwise adequately ventilated, but who is to determine what is adequate ventilation is not stated.

Staircases to ordinary dwelling-houses have also to be ventilated by means of a window or skylight opening directly into the external air.

Ventilation is also required under the floors of basements, except where the floor is of solid wood blocks bedded on concrete.

(To be concluded.)

A vote of thanks to Mr. Marsland was proposed by Mr. W. R. Mallett, seconded by Mr. H. Lovegrove, A.R.I.B.A., and supported by Mr. G. A. T. Middleton, A.R.I.B.A., and Mr. W. Allport, and carried with acclamation.

THE EARLY HISTORY OF THE SOCIETY OF ARTS.*

TO William Shipley, a landscape painter, "who, from a well-grounded persuasion of the extensive utility of the art of drawing to this nation, erected the academy in the Strand, opposite Exeter Change," is due the credit of having founded the Society of Arts. His proposals for raising, by subscription, a fund to be distributed in premiums for promoting improvements in the liberal arts and sciences, manufactures, &c., were made in 1753—eight years after the suppression of the Jacobite rising of '45—at a time of great literary activity, but when the agriculture, the arts, the manufactures of the country were at perhaps as low an ebb, compared with the Continent, as they have ever been. The next year, 1754, a meeting was held at Rawthmell's Coffee House, in Henrietta Street, Covent Garden, to consider the propriety of establishing a Society for the Encouragement of Arts, Manufactures and Commerce. The only learned societies existing at that time in the kingdom were the Royal Society, founded in 1660, and the Society of Antiquaries, which was founded in 1701 and incorporated in 1751. In the opinion of those present at Rawthmell's Coffee House, it was considered that drawing was absolutely necessary in many employments, trades and manufactures, and that the encouragement thereof might prove of great utility to the public. If any of those gentlemen had managed to live another 140 years they would have been gratified, no doubt, at finding that drawing was now a compulsory subject of instruction in elementary schools in England and Wales, though still only optional in Scotland, and but sparsely cultivated in Ireland. Far-seeing as they were, however, these gentlemen—those names are, I trust, preserved somewhere—had to satisfy themselves with offering prizes, which were duly advertised on March 29, 1754, to boys and girls for drawing, besides offering premiums for the discovery of cobalt in England, the growth of madder—the price of which had been raised to an extravagant figure by foreign growers and importers—and the manufacture of buff leather. It is interesting to find that among those boys and girls who received prizes for drawings in 1755—the first year of their award—was Richard Cosway (then under twelve years of age), who became the celebrated miniature painter and Royal Academician. Of his works the Society possesses two examples—the portrait of William Shipley, who founded the Society, and was its first secretary, and of Dr. Templeman, who was secretary from 1760 to 1769. Among others who received the premiums of the Society, and subsequently became distinguished artists, were John Bacon, for a figure of Peace; Joseph Nollekens, for a model of a farmer with a kid; William Woollett, the engraver, for a figure drawing. This was in 1759; while, in 1763, there occur the names of Thomas Banks, John Mortimer, George Romney and Richard Earlom, the mezzotint engraver. In 1766 John Flaxman, then only eleven years of age, appears in the premium list, and in 1788 Thomas Bewick writes that "the favourable impression which some of my juvenile performances have met with from the Society of Arts emboldens me to again submit my labours to their view." In later years we find the names of Lawrence, Turner, Mulready, Ross and Landseer, Frith, Millais and Hook.

The prizes seem to have been restricted to students who were under twenty or twenty-one years of age, and were given

* From the address delivered by Major-General Sir John Donnelly, K.C.B., at the first ordinary meeting of the Society on the 21st inst.

principally for drawings made from a collection of sculpture and casts formed for the Duke of Richmond between 1750 and 1756 by John Wilton, which collection his Grace patriotically placed at the disposal of the Society for this purpose; and for drawings made at the Academy which had been established by William Shipley. I may mention in this connection, as showing what the State was doing and what other opportunities were afforded to students, that the British Museum, in the establishment of which some of the early patrons of the Society of Arts seem to have largely participated, was not opened to the public till 1759. It had its origin in the bequest by Sir Hans Sloane—who died in 1753—of his collection of natural history, his large library and his curiosities, in the purchase of which he had, it is said, expended 50,000*l.*, to the use of the public on condition that Parliament should pay 20,000*l.* to his executors. The money for this and the purchase of Montagu House and grounds was raised by a public lottery, with guinea tickets. The National Gallery was not established until some seventy years after the Society of Arts was founded.

The Royal Academy, which was founded in 1768, grew out of the exhibitions of the works of the competitors for the prizes offered by the Society of Arts. Before that took place, however, in 1755, Mr. Henry Cheer, one of the judges in the first art competition, proposed to the Society "a plan for an academy of sculpture and painting," accompanied by a draft of a proposed charter of incorporation, and it is probable that when William Shipley proposed the establishment of a Society for the Encouragement of Arts, Manufactures and Commerce, he had in view principally the encouragement of art. However that may be, in 1760 Francis Hayman, chairman of the committee of artists, requested the Society to allow an "Exhibition of Polite Arts" to be held in their great room. This was granted, and the first exhibition of works of native artists was opened on April 21, 1760, in the Society's rooms in the Strand, near Beaufort Buildings. The origin of these exhibitions is thus recorded in the first volume of the *Transactions* of the Society:—"The reputation acquired by candidates in consequence of their performances remaining for some time under the inspection of the Society, before and after adjudication, occasioned the artists in general to apply for an exhibition of their works in the Society's great room, which request was accordingly complied with and repeated for several years. Hence arose the annual exhibition of the rival artists who formed themselves into separate bodies." According to the writer of an article in *Engineering*, these were called the "Free Society of Artists" and the "Society of Artists of Great Britain," and out of the split grew the Royal Academy, which appears to have been assisted, at the outset, from the funds of the Society of Arts.

"The Society having been thus far fortunately successful," I am quoting again from the *Transactions*, "in rearing the infant arts in this kingdom to such maturity as qualified them for royal favour, next confined the award of their premiums to those who may intend to be professors of the arts, or such young persons of rank and eminence who may probably become hereafter the patrons and patronesses of the fine arts. Encouragement has also been given to those branches of the polite arts which will more immediately tend to improve the manufactures and consequently promote the commerce of the country."

This may sound rather tall talk. But it must be remembered that the Society became very rapidly influential. A large number of well known and distinguished men joined it at the outset. The signature book of the Society, which is dated 1754, but continued in use for some time after, shows that among its members were a considerable proportion of the peerage—I may mention the Dukes of Devonshire, Marlborough, Portland and Queensberry, and apparently nearly all the eminent Commoners of the day, such as Samuel Johnson, Boswell and Topham Beauclerk; Henry Cavendish, Benjamin Franklin and William Hunter; Sir W. Chambers, the architect; George Colman, the dramatist; David Garrick and Gibbon, and John Howard, the philanthropist; Hogarth, Allan Ramsay and Sir Joshua Reynolds; Horace Walpole and John Wilkes. Goldsmith was not a member, but was an unsuccessful candidate for the secretaryship. The only speech Dr. Johnson is said to have made on his legs was delivered in the meeting-room of the Society of Arts. Before leaving this sample, if I may say so, of the early list of the patrons of the Society, I must not omit the name of John Angerstein, whose fine collection of pictures formed the nucleus of the National Gallery. It will thus be seen that in any movement which the Society supported it could throw great weight and influence.

It is amusing to find the Society in these early days trying a kind of graduated income tax in a small way. Thus the contribution of a nobleman was five guineas, while that of a commoner was generally only two. Among the few commoners who gave five guineas were General Robert Clive (afterwards Lord Clive), and William Pitt (afterwards Earl of Chatham).

I have said enough I believe to show to what extent the Society influenced art education in its early days, and must now hurry on to its later work. But before doing so it is as well

perhaps to call attention to the fact that the Brothers Adam having, in 1768, commenced their scheme for erecting a handsome set of houses on the piece of land formerly belonging to Durham House—famous for such distinguished residents as Lady Jane Grey and Sir Walter Raleigh, among others—an arrangement was made with them for the erection of the building which the Society now occupies. The first stone was laid by Lord Romney, then president of the Society, on March 28, 1772, and in June 1774 the Society entered on its new premises. It was thought desirable to take advantage of the opportunity afforded, by the fine meeting-room in the new house, to attempt to give a fitting representation on its walls of the powers of the English painters whose works had been first exhibited under the auspices of the Society. A proposal was therefore made to some of them in 1774, through Mr. Valentine Green, the engraver, a member of the Society who took much interest in its welfare, to paint eight historical and two allegorical pictures. For the former, application was made to Angelica Kaufmann, Sir Joshua Reynolds, Benjamin West, Cipriani, Dance, Mortimer, Barry and Wright; for the latter, to Romney and Penny. The scheme came to nothing—it is said, mainly owing to the opposition of Reynolds. This may be so; but seeing that the only payment offered to the artists was the profits of an exhibition of their pictures for four months, I think we need scarcely go so far a-field to seek the reason for the "promising" scheme coming to grief. In 1777, however, Barry, who is described as being at that time young and enthusiastic, and having 16*s.* in his pocket, offered to do the works which now surround your rooms, apparently for nothing more than the cost of the canvas, paint and frames; these frames he designed as you see them, and for them the Society paid 100*l.* 17*s.* I am glad to say, however, that the young and enthusiastic artist did not remain entirely unremunerated, for the public exhibition of his works, which was held at the expense of the Society, and was visited by some 9,950 persons, produced about 500*l.* The remuneration was not extravagant, and he complained that his works were being neglected, while thousands of pounds were being squandered upon a "jubilee of hackneyed German music; an empty hubbub of hundreds of fiddles and drums, which was dissipated into the air as soon as performed." But still it is something to know that, having worked in faith with zeal, his faith was not altogether misplaced pecuniarily, and that for a time his works were the talk of the town, as being the first attempt in England to revive the art of covering walls with large decorative pictures.

The history of the Society to the end of the eighteenth century was one of great brilliancy of achievement, though marked by some vicissitudes.

In its very early days the Society of Arts showed its just appreciation of the right course to pursue in not confining its efforts to the education of the producer, but in extending it to that of the consumer. As was soon made evident by the Government schools of design, established by Mr. W. Ewart's committee of the House of Commons in 1834, the question is not one simply of producing designers. What is the use of them until the popular taste can appreciate good decorative work, or discriminate between it and that which is vulgar and bad? And if intelligent appreciation is necessary to give mechanical invention, whose fruits appeal so directly to our material interests, a fair chance, how much more necessary is it in all that implies artistic treatment? Fine artistic perception is limited to the comparatively few, but who can prove to the rest of the world their ineptitude, their want of taste? If it concerned themselves only there would be no particular reason for making the attempt, but the law of supply and demand is no less inexorable in matters æsthetic than in matters materialistic. There is plenty of fair artistic ability potential in the land, if only the demand for its products were sufficient and of the right kind; an artificial forcing of the supply is absolutely useless without the demand.

But why, it may be asked, is it necessary to educate people in such matters now any more than it was in the times when those works were produced that are generally admitted to be examples for study? The answer is surely obvious. There is at the present time no living traditional art—it is all a matter of eclecticism. There is no sound basis of criticism, but plenty of it with a strictly literary backbone. Now, do not misunderstand me when I say there is no living art. I do not mean there are no living artists. Perhaps there are as great artists now as at any period. But they work in a very different environment. Take architecture, which, after all, must strike the keynote to all the arts of the day. During my lifetime we have been practising Classic, Gothic, Renaissance, Palladian, Italian, Jacobean, Queen Anne, and so on, while a few enthusiasts have brought in a spice of Mohammedan, Hindoo and Chinese. It is not my business to say which is right or which is the best; they are all right in a sense. I only desire to call attention to the difference in the circumstances during, say, this century, and the time when the admitted masterpieces were produced. Then, at a definite period, a specific form or style of art pervaded a whole country;

it had gradually been evolved from something that had gone before, and its evolution was proceeding, possibly, to something more vigorous, possibly, to decay; still it was a living art. The art patron of the day did not, before giving his order, run first through the whole gamut of styles to make his selection. He knew he must take what he wanted in the style of the day, and be thankful if it was good of its kind—the kind was the canon and standard of criticism. The artist worked; appreciated, stimulated, and to some degree checked by an intelligent public opinion which had been educated and instructed by its surroundings in that particular style of art. How different to this is the practice of late times. It is a toss up what the style may be. The work of the artist, instead of being spontaneous, is more or less an archaeological study. It is criticised as often as not for its style rather than for its goodness as an example of that style. The general public shrugs its shoulders, wonders what it is all about, and when something will be invented which, if lauded to the skies by some, will not be denounced as a monstrosity and an eyesore by at least an equal number of the art cognoscenti.

Let me give you an instance. I dare say several of those present can recall to mind the onslaught made on the design selected for the monument of the Duke of Wellington in St. Paul's, which was surmounted by an effigy of the Duke on horseback. The attack was led by perhaps the ablest periodical of the day as far as literary ability went, which had Gothic proclivities. The climax was reached in a remark attributed to a dignitary of the Church as to his inability to understand how a man could ride on horseback on the top of his own coffin. Alfred Stevens who, by the way, was some time master of the School of Design in Sheffield, is now generally admitted to be one of the greatest, if not the greatest, sculptor and original decorative artist that England ever produced, and the monument is, I believe, shortly to have the horse and rider provided for it according to the original design.

Under these circumstances it is to be wondered at that there are constantly violent fluctuations of opinion—that every now and then we hear a great outcry against the Royal Academy and its schools or South Kensington and its "system." And if South Kensington now why not in a few years hence the technical schools and courses of instruction which are being set up with so much care and thought in all parts of the country? I am sure this danger is already felt by many who are interested in technical instruction. The Science and Art Department could always point to the fact that, if its science teaching was wrong, it erred in good company, for the syllabuses were prepared and the examinations were conducted by some of the most eminent men of science of the day. If its art training was wrong, it was that which had been laid down by some of the most accomplished artists of the day; it was watched and reported on by such from year to year; and the so-called "system" was, for the matter of that, no invention of South Kensington, but the plan on which artists had been taught their trade from time immemorial.

But to whom can the local authorities under the Technical Instruction Act appeal? It seems to me that for their own satisfaction and for the future stability of technical instruction, they will desire, instead of remaining as it were isolated and self-contained, to have an influential examining and inspecting board, to which they might refer, if they found it desirable, for assistance and advice. There are at present several bodies partially covering the ground—but only partially, such matters, for instance, as the art industries, which have been largely taken up by County Councils, coming into nobody's parish; and there is the great disadvantage of a want of unity. This is not the moment to bring forward any detailed scheme. I desire now simply to throw out the suggestion that the Society of Arts, which is at present covering part of the field, should take the initiative in bringing all these bodies together, so that they may form some kind of joint board, or at least co-operate.

THE PHILÆ-ASSUAN DAM PROJECT.

THE following official memorandum upon the proposed modification in the Assuan dam project has been drawn up by Mr. W. E. Garstin, Under-Secretary of State in the Egyptian Ministry of Public Works:—

The Council of Ministers on June 3, 1894, approved in principle of the proposed dam and reservoir at the Assuan cataract, and directed the Ministry of Finance, when preparing the Budget for 1895, to occupy itself with the question of obtaining the funds necessary for the execution of this work.

The project, as then submitted to the Government, consisted of a dam with its crest at R.L. 114'0", which height would have enabled water to be stored in sufficient quantity for the requirements of Middle and Lower Egypt; in other words, for the whole country lying to the north of Assut.

Most unfortunately the construction of this dam would have necessitated the submersion for some six months every year of the celebrated Philæ temples, as well as of a considerable

number of Nubian monuments, which, although less known than those of Philæ, are of great importance to all those interested in the history of Ancient Egypt.

The archaeological societies of Europe, upon hearing of this proposal, protested against it in the strongest terms, and begged the Egyptian Government to reconsider its decision and to endeavour to find some alternative scheme by which the country might reap the advantages to be derived from a storage reservoir, without sacrificing the interests of science and archaeology.

The Ministry of Public Works, recognising that these protests were founded upon reasons so strong as to command respect, reconsidered the whole matter in detail, and endeavoured to find such modifications of the original scheme as might reconcile the interests of Egypt and of science.

The result of its studies is the modified project which has now been submitted to the Egyptian Government.

Before describing the proposal itself it will elucidate the question if the chief arguments brought against the Assuan cataract as the site for the dam be briefly criticised.

The first of these is that this site is not the only possible one to be found north of Wadi Halfa.

The second, and at first sight the strongest argument against the proposal is that it is impossible to lay down as an axiom that the Assuan cataract site is the only feasible one for a dam, while the river valley south of Wadi Halfa has been unexplored and unsurveyed.

The first of the above arguments may be dismissed in a few words. The question has been studied and discussed in the minutest detail by the Government engineers and the members of the Technical Commission appointed to report upon the project. The former and the majority of the latter are unanimous in considering that the site in question is, from the nature of the river bed and the formation of the rock, the only one north of the second cataract at which it would be safe to construct a work of the magnitude of that proposed.

The only other possible sites are those of Kalabsheh and Silsileh; these have both been condemned from the point of view of hydraulic engineering by the majority of the Technical Commission, *i.e.* by Sir Benjamin Baker and Signor Torricelli.

These experts have stated in the clearest terms as their opinion that there is only one safe site for a dam between Cairo and Wadi Halfa, *viz.* the Assuan cataract.

In the face of the above statement, with which the Public Works Ministry is in entire accord, this latter can in no way accept the responsibility of constructing the work at any other place than at Assuan.

As regards the second objection, *viz.* that there are possibly other suitable sites to be found south of Wadi Halfa, it is true that no detailed survey of the river above the second cataract has as yet been made.

Sir John Fowler, however, during the reign of the Khedive Ismail made some very close surveys of portions of the river between Wadi Halfa and Dongola, for the purpose of laying out the line of railway projected to Khartoum.

His plans go to show that in all probability the only possible site for a dam and reservoir is at the cataract of Hanneh, or at the Khaibar gate, which lies a little to the south of it. Now the Khaibar gate is within some forty miles of the town of Dongola and consequently no work would be possible in this region until this town had been retaken from the followers of the Mahdi.

There is another point which the supporters of the argument in question would seem not to have grasped, *viz.* that even if, as is probable, a dam and reservoir be made at some future time to the south of the second cataract, it will still be imperative to have a second dam and a second reservoir north of this place and consequently nearer to the point at which the water must be delivered for the purpose of irrigation.

The reason for this lies in the waste which would inevitably ensue in the long reach of river down which the water would have to travel before it arrived at the point of its delivery.

The river channel is not in any way one of regular section, but consists mainly of long reaches of wide and shallow area, interspersed with islands and side channels which are dry when the river is low. Anyone who knows the Nile is aware of the long time which elapses at the first rising of the flood before the effect of the rise at Wadi Halfa is felt at Assuan and to the north. The water has first to fill up all the side channels and to saturate their sandy beds before any material increase is given to the volume passing down to the north. As the river, moreover, would be at its lowest when the reservoir was discharging, this loss of water would be at a maximum.

When we add to the above the loss which would ensue from evaporation due to the action of the African sun upon the long and shallow reaches of water, it is evident that the total waste would be considerable, and the longer the distance between the reservoir and the point of delivery the greater this waste would be.

The Public Works Ministry then considers, and in this opinion Sir Benjamin Baker fully concurs, that it is absolutely

necessary for the success of the scheme, even although a dam may be eventually constructed far to the south, that a second work shall be built north of the second cataract, and as near to the point of delivery as is consistent with obtaining a sound site for its construction.

The technical advisers of the Government consider that they have proved the Assuan cataract to be the only safe site north of Wadi Halfa, and consequently the question narrows itself into the smallest limits. Whatever may be done elsewhere, the construction of a reservoir dam at the Assuan cataract is an absolute necessity if the scheme of water storage is carried out at all.

Accepting the foregoing conclusions as final, the Ministry of Public Works is of opinion that the most reasonable course to follow is to commence with the construction of the Assuan dam. This will take several years to build, and it is possible that during the progress of the work opportunities may arise for investigating the country to the south. There seems, moreover, to be no valid reason, supposing that the necessary funds are obtainable, for delaying the commencement of this work until the further investigation has been taken in hand.

The modified scheme as at present submitted is of the nature of a compromise; it is hoped that it will satisfy the scientific world, while, at the same time, it will further the interests of this country.

It is now proposed to build a dam at Assuan with its crest at R.L. 106.0, or 8 mètres (26 feet) lower than that of the original project. This work will of necessity store very much less water than the high level dam would have done. At the same time a reservoir of this height will supply sufficient water for the wants of either Middle or Lower Egypt separately, although not for their combined areas.

This will mean that the reclamation of the country will proceed more slowly than was at first proposed; and when in course of time the country to the south has been explored a second dam can be made which will store sufficient water for the needs of the rest of Egypt.

This proposal is no new one, but has been fully discussed and estimated for in Mr. Willcocks's report upon the different sites.

The great advantage to be derived from carrying out the work in the above manner is that it will only submerge portions of the Philæ Island, while it will leave the rest of the Nubian monuments untouched. A reference to Mr. Somers Clarke's note upon these latter will show that their levels are well above that of the highest water surface in the modified project as now submitted.

As regards the Philæ temples, the main buildings will be above high-water level altogether. It is true that the South Quay wall and some of the smaller temples would be submerged if left unprotected. It will, however, be possible, by the construction of a low water-tight wall or by other means to so arrange for their protection that no damage will be done to them by the water.

To a certain extent the artistic beauty of the group will be impaired, but in a land so full of interesting relics as is Egypt it is unfortunately impossible to carry out any great public work without in some degree interfering with some one or other of them. The only thing to be done is to try and minimise the interference as far as is possible, and in the present case the Ministry of Public Works thinks that it has succeeded in so doing.

As regards the details of the protection works to be carried out upon the Philæ Island this Ministry will consult the scientific societies upon every point, and will endeavour, as far as lies in its power, to meet their wishes in the matter.

In order to still further minimise any possible loss to science which might ensue from the construction of the reservoir, it is proposed to carry out an archaeological and scientific investigation of the whole of Nubia.

The English societies very rightly impressed the necessity of this work upon the Egyptian Government. The latter, although both willing and anxious to carry it out, found it impossible to do so, owing to the necessary funds not being available. If, however, the reservoir be made this difficulty at once disappears, as the cost of the above investigation will be added to the estimate of the dam itself.

The Public Works Department has been directed to put in hand as much of the work as lies within its scope and power during the ensuing winter season. Topographical surveys will be made and plans prepared; the true bearings of the temples will be fixed, and the preliminary plans of all sites completed.

This portion of the work being done, the Egyptian Government will ask the European scientific societies to depute certain of their members to come to Egypt and complete the work.

In this manner it is hoped that a record and a knowledge will be obtained of this most interesting country which will be worthy of the present age, and which should be of the greatest value to the scientific world in the future.

A reference to p. 41 of the Under-Secretary of State's note upon "Perennial Irrigation in Egypt" (December 1893) shows

the estimated benefits obtainable from a reservoir of the capacity now proposed to be as follows:—

If Middle Egypt be selected.		
Direct Annual Gain to the State.	Increase in Annual Produce.	Increase in Annual Rental.
£E 572,000	£E 4,685,600	£E. 2,346,900
If Lower Egypt be selected.		
£E 278,000	£E. 3,290,000	£E. 1,600,000

In the foregoing the increased value of the land has not been taken into account.

As is admitted in the above quoted note, these figures appear startlingly high; they are so high, however, that a very large deduction might be made from them and yet leave a margin of profit sufficient to warrant an expenditure in excess of what it is proposed to incur.

As regards the final detailed estimates of the modified dam, they will not be submitted before the spring of 1895. Certain questions as to detail have arisen which necessitate alterations in portions of the design. Mr. Willcocks has been deputed by the Government to proceed to England and confer on these points with Sir Benjamin Baker. When these are once definitely settled the final drawings and estimates can be at once completed.

PUBLIC BUILDINGS IN FRANCE UNDER THE FIRST EMPIRE.

(Continued from page 338.)

204. **Telegraphs** (July 1, 1806).—The telegraph at the Louvre, which was on the central pavilion next the Rue Froimanteau, has been in use for the last ten or twelve years; that upon the large pavilion in the middle of the Tuileries, erected at the same time, has never been used. Both are being removed, and a new one constructed on the Church des Petits-Pères.

208. **Column of Austerlitz on the Place Vendôme** (July 9, 1806).—By a decree a departmental column for the department of the Seine will be erected in the centre of the Place Vendôme, in honour of the warriors of the department who have fallen on the field of battle. The design of the column, as well as those in other departments, was selected by open competition. M. Sobre was awarded the prize, and will carry out the work. M. Molinos, the architect to the department, executed the work for the laying of the first stone by the prefect. This will not be carried further. In 1804 M. Dénon, director of the Museum, instructed M. Thierry to prepare plans and models for a column here to Charlemagne, enriched with bas-reliefs and ornaments in cast-iron, like the chimney panels and candelabra at the Pont des Arts. It never got beyond models.

July 1, 1806.—M. Gondouin, architect to the Institute of France, and M. Lapeyre, architect, of the Egyptian Institute, are instructed to erect a bronze column, to be called the column of Austerlitz; the excavation has been made and the square is already full of materials. Is that the end of these designs? The *Journal de Paris* in the number for July 14, 1806, says that it will be formed of cannon taken from the enemy; it will be 13 feet* diameter, on the model of Trajan's column at Rome, which is 150 feet high, in twenty-three blocks or courses 4 feet 4 inches high, hollow in the centre, in which there is a staircase of 184 steps carried up with the courses of masonry (assise).

214. **Arch of Triumph of l'Etoile** (September 3, 1806).—The monument which is being erected on the Place de l'Etoile, at the top of the avenue of the Champs Elysées, justly excites the attention of the curious and the zeal of promenaders. At the present time the first course of stone is being laid, which will serve as the base. An estimate may be formed of its dimensions on learning that the foundations are nearly 1,000 feet in diameter and 40 feet deep. It was formerly said, "This is the work of the Romans;" in the future it will be said, "This is a work of Napoleon" (*Journal de Paris*). M. Chalgrin, the architect for this building, told me that he had excavated for and laid the first course of footings in rock at a depth of 23 feet, and that M. Ledoux, the architect of the two barrier lodges at the side, had carried them down to a still greater depth to the level of the bottom of the well adjoining.

217. **Hall of the Institute at the Palace of Fine Arts** (October 4, 1806).—The Institute inaugurated its new hall at Quatre-Nations by a distribution of fine-art prizes. M. Vaudoyer is the architect of the hall.

218. **Column at Rosbach** (October 28, 1806).—The Emperor has ordered the column erected by the Prussians at Rosbach, to commemorate their victory over the French, to be taken down and conveyed to Paris, in honour of to-day's victory of the French over the Prussians on the same field of battle.

219. **Corps Législatif. Laying the First Stone** (November 23, 1806).—Yesterday the President of the Corps

* A French foot equals 1.066 English.

législatif, accompanied by the members of that body in Paris during the holidays, assisted by the architect, M. Poyet, under whose direction the new front of the palace is being carried out, and in presence of the artists who will contribute to its decoration, laid the first stone of the building. Before doing so the President made a speech.

221. The Triumphal Arch of l'Etoile (December 25, 1806).—The Minister of the Interior has asked for some explanation with regard to the triumphal arch now building at Etoile. The foundations are progressing, and the design is not yet settled. The architects entrusted with the work have before them four designs, two with columns and two without; they have not agreed which to choose. The Minister has referred these designs to a commission of the Institute, the members of which are MM. Gondouin, Peyre de Fourny and Heurtier. The situation is delicate, as the commission will have to decide upon the designs of architects who are members of the Institute, MM. Raymond and Chalgrin, and they will require to have regard to their brethren as well as to the Institute. The commission have decided in favour of a design with columns of small diameter.

222. On the Progress of Building (January 3, 1807).—

Whether on peace or war he's bent,
His burning genius o'er him reigns;
He finishes a monument
In the same way as his campaigns.
Thanks to his magic strategy,
His course of action is so skill'd,
His works require more time to see
Than they have taken time to build.

From "Arlequin Confiseur," a piece played at the Vaudeville Theatre in 1807. These lines describe in a few words and very effectually the active influence of Napoleon* on the buildings executed under his direction.

228. Triumphal Arch of l'Etoile (March 1, 1807).—The three first courses (assises) are entirely in rough stone (en libages), under the openings as well as the piers, and are in random courses (appareillés accidentellement), in polygonal blocks like the streets of the ancients. The courses are each 18 inches high and will cost about 60,000 francs (2,400*l.*). The upper courses will be carried out in a similar manner, but to save expense the voids of the arches are filled up with Nanterre stone (moellons de Nanterre). This material is from a top bed (vergelé); it is shelly, freezes readily, and is not suitable for external work, but is excellent for foundations.

232. The Madeleine, by M. Vignon (March 14, 1807).—Imperial decree of March 14 for 51,000 francs (2,040*l.*) for the payment of the competitors for the Madeleine. His Majesty having seen at his camp the fourth design, has not confirmed the decision of the Institute awarding the execution of the work to M. Deaumont, and has entrusted M. Vignon with the execution of the work according to his design which gained the *proxime accessit*. M. Deaumont is to have an indemnity of 12,000 francs (480*l.*)

345. Estimate for Versailles (October 1, 1807).—M. Trepsat is the architect of Versailles. For the last three years he has superintended the slight repairs but nothing new. Notwithstanding this, the Emperor has asked M. Gondouin, member of the Institute, for an estimate (devis) for the repair of the Palace of Versailles. A staff of six surveyors, under this architect, has been employed during the last twelve months on this immense work. He is now at Fontainebleau for the purpose of conferring with His Majesty. The work will be costly and will be of no avail, as M. Gondouin has declared that he will not superintend the work. M. Trepsat cannot undertake it as he has a wooden leg. M. Brongniart is in the field.

Report on the Public Buildings of Paris (August 30, 1807).—After a grandiloquent introduction attributing the whole of the credit of new public buildings to the Emperor, the report proceeds:—The works at the Panthéon are in progress; the works at St. Denis are nearly completed; the buildings of Napoléon and of Napoléonville are going on. Several churches and many bishops' palaces have been restored in the provinces. The tomb of Desaix is placed on the summit of the Alps (see No. 178), which are no less astonished on seeing for the first time a monument from the chisel of our artists than they were at seeing what was equally unexampled, the passage of an army dragging its numerous artillery by hand.

347. Column of Austerlitz (October 8, 1807).—Column of Austerlitz, Place Vendôme, by MM. Gondouin and Lepayre (*sic*), architects. All the preliminary works and the masonry of the Place Vendôme column are completed. The work of covering it from top to bottom with bronze bas-reliefs is now in hand. Several of these bas-reliefs are already cast, and the others will be ready before the end of the winter. As is known, they will represent the heroic deeds of the Grand Army in the campaign against Austria. The subjects were selected by M. Denon, director-general of the Museum, and modelled by M. Bergeret, a young painter of distinguished

ability. Some persons apparently regret that marble was not employed instead of bronze, in imitation of the Trajan column. It is feared that the bas-reliefs will not be sufficiently detached from the background, but this fear is vain if, as is asserted, the bas-reliefs are to be gilded.

248. Villa Borghese, Rome (October 6, 1807).—The Emperor has purchased from Prince Borghese, who is now in France, the antiquities at his casino at Rome, for about 11,000,000 francs (440,000*l.*)

M. Cretel, minister of the interior, proposed to M. Dufour to go out and arrange the removal and assist at that operation, but he could not go. M. Quatremer could not undertake the work. The minister, by the advice of M. Alquier, the ambassador at Rome, commissioned M. Paris, architect, who is on the spot, and sent out M. Lorimier, an artist with whom he is friendly, to assist him. The latter has accepted and started.

252. Triumphal Arch of l'Etoile (October 18, 1807).—This arch was decided upon so promptly that the work was begun before any definite plan had been settled. The result has been that the foundations at the fourth or fifth course are too short, and fresh excavations have been made to lengthen them. The settlements (tassements) are unequal, the joints are not good, and the superstructure may suffer from this circumstance and may show cracks. The architects, MM. Raymond and Chalgrin, are still divided as to the columns. Shall they be detached or engaged? Why have two architects? Was there ever Tasso & Co. for a poem, Racine & Co. for a tragedy? Genius cannot work under compulsion or restraint; it should have free play, as its productions are often spoiled by persons who worry or thwart it.

254. Panthéon, St. Geneviève (October 25, 1807).—When the church of St. Geneviève was secularised in 1792 and converted into a Panthéon, the towers and small campanile (?) of the dome were pulled down. Soufflot's nephew built at the rear an open staircase to the vaults. Now that the Panthéon has been reconsecrated, M. Rondelet is building new towers for the bells, is covering the open staircase with a peristyle, and is about to rebuild the campanile on the top of the dome.

258. Triumphal Arch of the Carrousel and the Barrier St. Martin (November 15, 1807).—The architecture of the triumphal arch of the Carrousel is finished, but not the sculpture; it has been uncovered, however, to give a fête to the Imperial Guard on its return from the armies on the 25th instant. For this purpose M. Chalgrin is erecting a triumphal arch in wood at the Barrier St. Martin, for the entry of the Old Guard into Paris.

269. Pont St. Michel demolished (November 24, 1807).—The tender for the works for the demolition of the houses on the Pont St. Michel, amounting to 101,000 francs (4,040*l.*), was accepted last week, and the contractors undertake to complete the work in three months. Yesterday the workmen were already employed on the demolition. The cost was estimated at 66,000 francs (2,620*l.*), so that there is an increase of 35,000 francs (1,400*l.*) in the cost.

263. Tower St. Louis, at Brest (March 3, 1808).—M. Bernard, inspector-general of roads and bridges, who died at Paris on February 26, 1808, aged sixty-seven, executed various works. Among others, he restored the tower of St. Louis, at Brest, which overhung in a dangerous manner, to a vertical position. The Leaning Tower at Pisa and the tower of the Asinelli at Bologna might be treated in a similar way.

267. Triumphal Arch of l'Etoile (March 1, 1808).—The minister of the interior, M. Cretel, having appointed commissions on the several designs by MM. Chalgrin and Raymond for the triumphal arch of l'Etoile, the foundations of which are out of the ground, although the style in which it is to be carried out is not decided, has consulted separately by letter several architects to whom he has submitted on different days the drawings of MM. Raymond and Chalgrin's designs. He addressed the following questions to MM. Peyre, Celerier, Dufonruy, Vaudoier, Heurtier, Durand and Fontaine:—1. Should the work have three arches, one large and three (*sic*) small, or one large arch only? What was the rule generally followed by the ancients? How many triumphal arches are there with three openings, and how many with one opening? 2. Should the columns be engaged or detached? Are there any ancient examples to support either system? 3. Should there be four walls in front of the height of the stylobate? 4. And finally, what materials should be used for the stylobate as well as for the other portions of the monument. On March 1 the architects sent in their replies. They unanimously prefer an arch with a single opening and with detached columns.

March 3, 1808.—The minister of the interior, M. Cretel, presented to the Emperor MM. Chalgrin and Raymond's design for the Arc de l'Etoile, with an abstract of the architects' opinions on the subject. He would not follow any of these, and, to put an end to the great question, as to engaged or detached columns, has decreed that the arch shall be without columns, and the size considerably decreased, in order that it may be completed in a shorter time and reduce the cost;

* Compare Vaudoier's opinion with that in Note 175.

the opening will be decreased from 45 feet to 30 feet, and the other portions in the same proportion, which will reduce the size by a third and the cost from six millions (240,000*l.*) to four millions (160,000*l.*). Here we have a quarry of foundations as useless as they are costly, and a gateway very mean and paltry for the finest entrance to Paris. The mountain will have brought forth a mouse. Since the reduction of the gate the foundations formed in the void are not sufficiently forward; it will be necessary to remove the filling-in and replace it with stone.

(To be continued.)

GREEK ART.

At a meeting of the Odde Volumes, Chelmsford, Mr. F. H. Meggy read a paper on the "Incipience of Greek Art," in the course of which he said that in its incipient stages Greek art was undoubtedly inspired by the art of Egypt, Babylon and Assyria—in the first place probably through the tribes from whom the Greeks descended being brought into contact with the Phœnicians themselves, who early became intimately acquainted with the more ancient civilisations. The exhibition of the Phœnician temple treasures probably served as technical schools of art for the barbaric progenitors of the classic Greek. There might have been direct contact with Egypt so early as 3000 B.C., as Mr. Petrie's excavation near one of the pyramids of what he considered a settlement of barbaric Greek artisans taken in war seemed to be wonderfully corroborated within the last few weeks by Mr. A. J. Evans, who in Crete found Egyptian articles of the twelfth dynasty (from which he would trace the spiral motive in decoration to Mycenæ on the one hand and Ireland on the other) mixed with pottery marked like that found in Mr. Petrie's excavated settlement. With examples from pre-Homeric, the Mycænæan and later ages, and references to well-known examples in the British Museum, he briefly traced the progress of Greek art from the archaisms of lines and zigzags to the perfect delineation of the figure in painting or sculpture.

COMPETITIONS.

THE City Council of Coventry are about to invite designs for complete Municipal Buildings, which are to embrace the old historical St. Mary's Hall, and some other ancient buildings which have for many years been used for municipal purposes.

They invited, by advertisement, architects who had had some experience in similar work, and who were willing to compete, to send in their names with drawings or photographs of their executed works, and twenty-five names were sent in.

The City Council have selected eight of the applicants, who, together with any Coventry architects who might desire to compete, will be supplied with the necessary instructions and plan of the site available.

The City Council have been advised in the preparation of these instructions by Mr. Charles Barry, F.S.A., and have appointed him as their assessor in the selection of the best designs.

A premium of 150*l.* is offered for the best design and 50*l.* each to the authors of the designs adjudged worthy of the second and third place.

Designs are to be sent in on March 2, 1895.

As the new buildings will be carried out in sections from time to time as means become available, a special provision is made for a payment of 1½ per cent. to the architect appointed, or to his representatives, on the estimated cost of the unexecuted portions of his design if no orders for their execution be given within seven years from the award.

The committee of management of the West of England Eye Infirmary, at Exeter, are proposing to erect a new building on the site of the present premises in Magdalen Street, and in August last they invited architects to send in designs in competition on instructions issued.

These designs are to be delivered on November 30.

The committee have appointed Mr. Charles Barry, F.S.A., late president of the Royal Institute of British Architects, as their assessor to advise them in the selection of the most suitable design.

This competition to be a dual one. From the designs sent in at first (which are to be to a scale of 16 feet to an inch), not fewer than three or more than six will be selected by the assessor for the final competition (drawings to be 8 feet to the inch), and to each of the architects so selected an honorarium of 25 guineas will be paid.

The successful architect in the final competition is to be employed as architect to the building on the usual professional terms.

The work is intended to be commenced at once, but if its commencement should be delayed for two years after the

award, the architect is to be paid 100 guineas (in addition to the honorarium), and his designs will then become the property of the committee.

CHURCH BUILDING AND RESTORATION.

Heydon, Berks.—The fine old parish church of SS. Peter and Paul, which for the last few months has been undergoing partial restoration, was reopened for Divine service on the afternoon of Tuesday, the 20th inst., by the Bishop of Thetford, accompanied by the rector (the Rev. B. J. Armstrong), the Rev. A. H. Upcher (rural dean) and many of the neighbouring clergy, when, after a full choral service, the Bishop preached a sermon appropriate to the occasion. The principal works of restoration (which as far as possible have been carried out strictly on the old lines) have been that of the nave roof, the old timbers of which have been removed, cleaning and rinsing, however, such of the old as were practicable, the deficiency being made up with new timbers of English oak, the whole oiled and covered with oak boarding, recasting and relaying the lead, repair to the coping and parapets, new gutters, &c., reglazing the clerestory windows, and re-stuccoing the external walls. A new stair and handrail has also been supplied to the interesting old pulpit, and the sounding-board and pulpit itself have also undergone renovation. The south aisle has been laid with wood blocks and oak kerbs, the roof timbers repaired and covered with deal boarding, and restoration effected to the south porch, the roof of which has been releaded. Mr. J. H. Blyth, contractor, of Foulsham, has satisfactorily carried out the principal works, Mr. J. T. Gibson, plumber, of Norwich, executing the recasting and laying of the lead and also the glazing to the clerestory windows, the whole being under the superintendence of Mr. Herbert Green, architect, of Norwich.

St. Edmund's Catholic Church, Miles Platting.—The foundation-stone of this church was laid by the Right Rev. Dr. Bilsborrow, Bishop of Salford. The congregation, headed by the St. Joseph's brass band, walked in procession through the district. The architects for the new buildings are Messrs. Pugin, of London, and the contractors Messrs. Robert Neill & Sons. The total cost is estimated at about 10,000*l.* The new church will provide accommodation for 1,100 persons. It will be divided into five bays, each 25 feet long. In the bay at the west end the gallery will be placed, and another bay will be occupied by the chancels and side chapels. At the corner of Monsall Street and Mary Street a tower will ultimately be erected. The total length of the church internally will be 125 feet, the width 65 feet, and the apex of the roof will be 62 feet above the level of the ground.

GENERAL.

The Guardians for the Union of Merthyr Tydfil have recently selected from twenty-five other candidates Mr. E. A. Johnson, M.S.A., of Abergavenny, for the appointment of architect for their new infirmary which is to be built at Merthyr, at an estimated cost of over 10,000*l.*

Signor Ansiglioni, sculptor, who some years ago had a period of fame and fortune, has, it is announced, just died in poverty at Rome.

The Liver Sketching Club has opened its autumn exhibition with 252 works in oil and water-colours. The selection of works has been more than usually severe. Mr. John Finnie, the president, exhibits *Sundown, Autumn*.

A Partnership has been arranged between Mr. James H. Keats, of Plymouth, and Mr. E. Coath Adams, of London. The title of the firm will be Keats & Coath Adams.

The Conservative Club at the corner of Bothwell and Wellington Streets, Glasgow, was opened on Thursday. It was designed by Mr. R. W. Edis, F.S.A., and has cost about 33,000*l.* The style is Scottish Renaissance, and marble has been much used in the interior. Messrs. Wylie & Lochhead were among the contractors.

Mr. Burton Barber, the animal painter, died on Tuesday night.

The Designs by Messrs. Basil Champneys, Field, Jackson and Taylor, for the Hampstead Central Library, will be on view at the Vestry Hall, Haverstock Hill, from Tuesday to Thursday in next week.

Mr. P. H. Rathbone will read a paper entitled "The Economic Value of Fine Architecture" at a meeting of the Liverpool Architectural Society.

Lieutenant-Colonel Ford has put down on the notice paper of the County Council a motion asking the general purposes committee to consider and report on the feasibility and desirableness of securing a supply of sea water for London, with a view to its use for sanitary purposes.

The Architect.

THE WEEK.

THE decision which was given on the appeal of the Bromley Local Board, on Tuesday, will, we hope, convey a lesson of which several of the representative authorities in this country stand in need. The law has in many things given them almost despotic power, but when an authority will act like an ordinary individual it must expect to have no especial privilege. In the case in question the Bromley Board made an agreement such as one man might enter into with another man, and years afterwards tried to get out of the consequences by assuming all the majesty of authority. The facts were simple. In Bromley, as elsewhere, it was considered desirable to encourage building. The Board accordingly agreed that if a certain road were laid out to the satisfaction of the surveyor and kept in repair for six months it would then be taken over as one of the streets. The agreement, however, was not sealed, and the usual public notice was not given of the intention to adopt the road. Apparently there was a great deal of traffic, and as the Board neglected the road it fell into a state of disrepair. Six years ago the Board, ignoring what had been agreed, served notices on the frontagers ordering them to put the road into proper condition. As they did not obey the work was done by the Board. An action was afterwards taken to recover the money, but the county court judge held that the original agreement was binding, and that the frontagers were not responsible for the outlay. The Board appealed. Mr. Justice GRANTHAM said it was impossible to doubt, on seeing the agreement and the minutes of the Board, that it was intended to treat the road as a new road, and on the strength of the arrangement large sums of money had been expended by the frontagers. His lordship said the plea about the agreement not being under seal was immaterial, for the question was whether the work to be done by the frontagers had been accepted by the Board, and as that was decided in the affirmative by the judge of the Court, the case could not be sent back. The appeal was therefore dismissed. The case is one of those which are so often arising, in which the members of a Local Board appear to consider that the history of a town did not begin until they were elected. They reject all that was done by their predecessors in office. A little care in examining the minute book would have shown that there were no grounds for an action against the frontagers, but as long as the members of a Board are not held responsible for law costs which need not have been incurred, we must expect similar actions will arise.

It is gratifying to learn that the inadequate remuneration offered by the London County Council for the architectural work of the proposed asylum has not attracted applications from the class of architects who are competent to undertake the responsibility. One of the councillors at the meeting on Tuesday considered that some of the candidates were competent—that is, if judged by a readiness to accept 800*l.* a year salary, but another member declared they were all “entirely inexperienced, and would inevitably prove to be more expensive in the long run,” while some described them as “merely men who had no practical experience, but were simply theorists who knew nothing about the work.” The fact that so reckless a body as the County Council, who are willing to sacrifice all considerations to an apparent economy, hesitated about employing any of the candidates, testifies to their unworthiness. These gentlemen may, however, improve in time, and for that reason we do not intend to damage them by publishing their names, although they have not shown much *esprit de corps*. Having failed in their first endeavour the Council now propose to try the effect of another sort of bait. They offer 10,000*l.* instead of commission. As the building is estimated to cost 375,000*l.*, the rate of remuneration is only a little over 2½ per cent. If the building was of the warehouse class that rate might offer some temptation, but the asylum will

require constant care, and, under the circumstances, not much of the duty can be entrusted to a deputy. If architects will be firm, the County Council will be compelled to pay the established commission, and an evil precedent cannot be set up which will apply not only to municipal buildings but to those of private owners.

WHEN writing last week about the systematic efforts of the Germans in dealing with classic archæology, we refrained from pointing the moral by referring to the case of Sir CHARLES NEWTON. His death now allows the truth to be stated. When, in 1852, he was sent out to Mitylene as a vice-consul, the Government had decided on an experiment in imitation of what was done by the Germans. Accordingly, Mr. NEWTON was made a sort of representative. He succeeded in rescuing the remains of the Mausoleum; but his stay was only temporary, and Mr. PULLAN, who co-operated with him, possessed no official rank. The consequence was, that after their departure Halicarnassus relapsed into its ancient solitude. The Germans would have kept a succession of vice-consuls there, who would have aided inquiries, and the restoration of the monument erected by ARTEMISIA would have exercised the powers of most of the architectural students of Germany. We can show two unsatisfactory attempts. In 1860 Mr. NEWTON appeared as consul in Rome, but as he was removed in a year, he was unable to diminish the influence of the German Institute. The experience which was attained by him and by Mr. PULLAN was therefore no more than a temporary gain to the country, for neither of them was able to instruct a successor. Both men could have helped to set archæology on its proper basis, which is architecture, as the Germans are now doing in Greece and Italy. All Mr. NEWTON was permitted to do was to increase the collections of the British Museum, and although he was fortunate in acquiring bronzes, vases, gems, &c., it was impossible by their aid to give a true notion of archæology. What the mineralogical cabinets are to geology the sculpture galleries and vase rooms are to classic archæology. Hence it is that the true value of the Bloomsbury collections is only apparent to Frenchmen and Germans, for having commenced the study of archæology in a right way, they are able to perceive the relations of the sculptor's and potter's work to a higher art. But it is severe work even for them. As M. WEY says, “One comes out fatigued from the British Museum, and disposed to consecrate the rest of the day to *flânerie*.” Mr. NEWTON might have wrought many changes if the country was with him. He was born in 1816, and in 1840 he entered the Greek and Roman department of the Museum. He was appointed keeper in 1861, an office he held until 1885. If he desired he might have obtained the chief librarianship, for the Trustees were confident in his powers and especially his tact. Among his acquisitions were the gems belonging to the Duc DE BLACAS and the Castellani collection of bronzes and vases. He was elected professor of archæology in the University College, London, in 1880, and was the first to hold the office. He was the author of “Travels and Discoveries in the Levant,” “Essays on Art and Archæology,” and with Mr. PULLAN, “Discoveries at Halicarnassus.” Sir CHARLES NEWTON died at Westgate-on-Sea on November 28, and he was buried in Kensal Green on Tuesday last.

THE following officers of the Society of Antiquaries of Scotland were elected on Friday last:—President, the Marquis of LOTHIAN; vice-presidents, R. ROWAND ANDERSON, LL.D., REGINALD MACLEOD and JAMES MACDONALD, LL.D.; members of the Council, Sir GEORGE REID, LL.D., P.R.S.A., and J. R. FINDLAY (representing the Board of Trustees), J. BALFOUR PAUL, Major-General Sir R. MURDOCH SMITH, the Hon. HEW DALRYMPLE, ALEX. J. S. BROOK, Hon. JOHN ABERCROMBY, JOHN TAYLOR BROWN and CHARLES J. GUTHRIE; secretaries, D. CHRISTISON, M.D., and ROBERT MUNRO, M.D.; secretaries for foreign correspondence, Sir ARTHUR MITCHELL, K.C.B., M.D., LL.D., and THOMAS G. LAW; treasurer, J. H. CUNNINGHAM; curators of the Museum, Professor DUNS, D.D., and ROBERT CARFRAE; curator of coins and librarian, JAMES CURLE, jun.

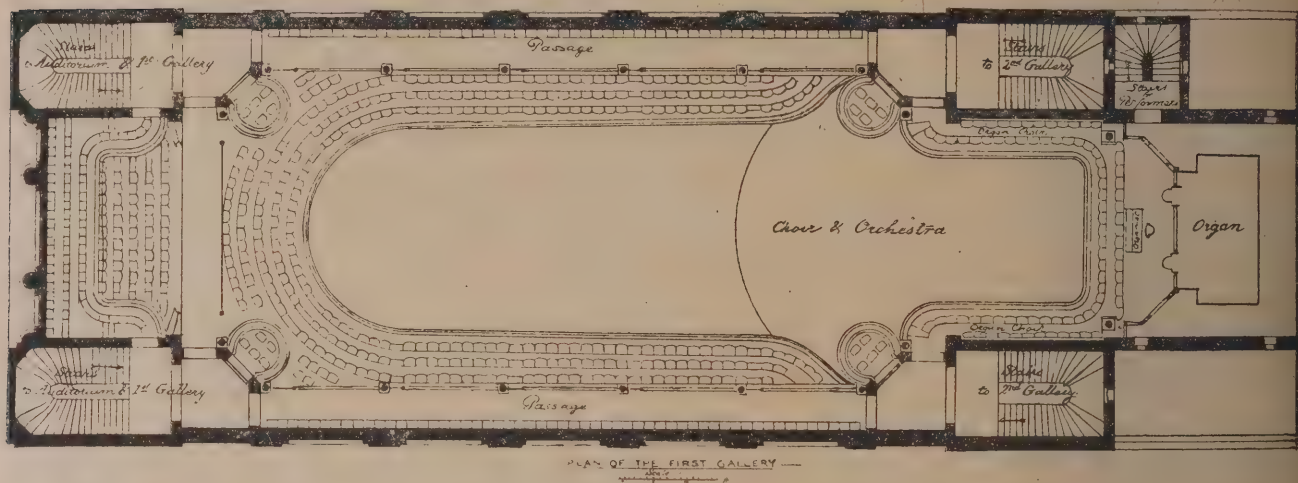

THE VICTORIA HALL OF GENEVA.

BY LAWRENCE HARVEY, F.R.I.B.A.

THIS building, which has just been completed, is perhaps the most perfect example of a concert-room extant. It is due to the munificence of Mr. D. F. BARTON, the British Consul in Geneva, who has spared neither money nor pains to make it what it is. The hall has had also the good fortune of being designed by the Brothers CAMOËTTI, architects of exceptional talent, as may be seen

galleries. To these proportions and general disposition of the space which gently rises from front to back are perhaps mainly due the exceptionally good acoustical properties of the hall; but there are refinements in the setting out of the galleries and seats which no doubt contribute to the satisfactory result. For instance, the plan reveals that the front lines of the side galleries are not parallel, but slope outwards as they near the stage. The figures marked on the working drawings show that the distance from the gallery to the centre line of the hall is 9 inches wider at the part near the orchestra than at the opposite end. Then the levels of

VICTORIA-HALL GENEVA

by the grand building for the General Post Office, which was erected from their designs and under their superintendence on the main thoroughfare which leads from the Geneva railway station to the harbour.

The hall is about 200 feet long, 62 feet wide and rather low-pitched. Both ends are narrowed to leave space for the four staircases, which give access to the auditorium and the galleries. The hall is also further narrowed by the

the seats have been everywhere set out on isacoustic curves, so that each seat offers the same advantages for hearing and seeing.

The photographic view of the interior gives an idea of the splendour of the decoration adopted. The style is no pedantic reconstruction of any particular epoch, but yet may be said to have been inspired by such examples as the interiors of the palaces of Fontainebleau and Versailles.

The ceiling is certainly according to the LOUIS XIV. precedents. The painting which decorates the central field of the ceiling is from the brush of M. BIELER, a Swiss painter. It represents the opposition of the matter of fact world in which we live with the realm of the ideal, and also of terrestrial with celestial harmonies—a kind of abstruse symbolism which is much in fashion with Swiss artists at the present time. To these explanations we may add that the tone of the colour decoration throughout is deep purple, crimson and gold.

The hall is lighted by 1,000 electric lights of 16 candle-power, of which 120 form a crown of iridescent carbuncles all round the ceiling. Besides these there are 400 similar electric lights for the passages, vestibules and other parts of the building. Arrangements have been made for three degrees of lighting. All the lights will be on for exceptional occasions, such as the inauguration of the hall or the reception of some honoured guest; a brilliant but yet reduced lighting will be used for ordinary occasions, and a still more modest display for such practical purposes as rehearsals, and so on.

A point to be well kept in mind by all architects who

may have the designing of theatres, concert-halls, or other places of public entertainment is the following. All the seats fold up automatically, arms as well as seat, when the occupiers rise, so that there are no impediments to the egress of the public. This is a feature which might advantageously be adopted even in churches and chapels.

As the building is surrounded on three sides by streets and yet has no windows, being lighted from above, it offers a good example of the architectural treatment of blank walls. The details of the architecture belong to the Classic Renaissance of the LOUIS XIII. period, but the spirit of the whole is distinctly Egyptian. The main entrance is flanked like an Egyptian temple by two massive pylons, which frame between them a rich colour decoration. This decoration is executed in a kind of paste which has all the hardness and durability of marble. It is the patent of the Cie. Industrielle Gènevoise. The door itself, which reminds one of some of the architectural features of the Palace of Fontainebleau, is decorated with the arms of the BARTON family, in which appear a boar's head, roses and fasces of arrows, bearing the motto "Fide et fortitudine." Above the door stands in the simplicity of EVE a huge and yet graceful embodiment of the spirit of music; she seems just

sprung from the waters, holding in her hands a harp covered with reeds. Three years ago this statue was exhibited in the Paris Salon, where it was much admired. It has the merit of being a novel treatment of a hackneyed subject and an acceptable relief from the ever-recurring Greek classic muse so dear to Philistines, of which there are not a few even in Geneva.

The sides of the building exhibit but large panels, with no other decoration than the good taste and proportions of the cornices and stonework. And here we beg those who see only the photographic view of the exterior not to form a hasty judgment, for we may say it appears on paper much smaller than in reality. The same observation applies to all buildings designed in the colossal Classic style—that is, in the style where the building is considered as composed of one order of architecture, such as the Victoria Hall and the Central Post Office in Geneva, and the buildings erected by MICHEL ANGELO on the Capitoline Hill at Rome. All these buildings look small in drawings and overpoweringly grand in reality, whereas the peculiar architecture of several of the most recent London buildings gains on being seen in drawings and photographic views where the smallness of the details cannot be gauged. But what a fall there is, what a deception, when we are face to face with the buildings themselves, with their gimcrack and petty details which we may carry off bit by bit in our pockets if we feel so disposed.

We beg London architects when they pass through Geneva to closely examine the construction of the two buildings we have named, for they will find that they are composed of boulders, each measuring about 6 feet by 8 feet by 4 feet and more. These boulders go right through the wall, forming a true isodomos stonework, as in the Parthenon of Athens. They are honestly what they appear to be, and not simply a 6-inch or 9-inch veneer, such as covers the so-called stone fronts of many London buildings. Absolute truthfulness seems a very difficult virtue to be faithful to in architecture as well as in morals, and the Geneva walls sin also in this instance, for they usually appear much less powerful than they really are. Here we constantly find the huge boulders which compose the walls worked on their face as if they were two or three courses of stone, a fact which a careful examination of the jointing will soon reveal.

It is curious to see how close is the connection between building and the character of the people who practise the art. In England, where we use sham stone fronts, keeping up appearances—that is, trying to seem wealthier than we really are—is the great social law. In Geneva it is just the reverse; people do their utmost to seem poorer than they are, and thus both nations deceive one another.

It will be noticed in the plan that the stairs exhibit peculiar curves in some of the steps. Thanks to this device, which is well known in French work, the stairs gain a very easy ascent. To my old pupils of the classes of masonry, I may say that these steps are first set out on the principle of the dancing stairs, of which we have constructed a model last year at the Guilds Institute, and then the line of the nosing of each step is deflected so as to bring the inner end normal to the well-hole and the outer end normal to the wall-string.

Such are some of the lessons to be gathered from the new hall erected in Geneva by one of our own countrymen to serve as another connecting link between Englishmen and Genevese, who can reckon already more than three centuries of fast friendship.

Before closing this communication, I wish to say something about the principal artist who conceived and executed this noble work, for, alas! he departed from the scene of his labours too soon to see the Victoria Hall completed. His name is JOHN CAMOLETTI, born in 1848, deceased six months ago.

To our young colleagues, who hanker after studies made easy by the establishment in London of a great school of architecture, such as the Ecole des Beaux-Arts in Paris, we may point to JOHN CAMOLETTI, who became one of the greatest architects of the age without ever having attended any school whatever beyond the primary or Board school of the village in which he was born. So true it is that it is native genius and not training that makes the artist. He did what many an English lad has done, and is doing now. He entered an architect's office as office boy, and from this

humble beginning steadily worked up his way to the highest round of the ladder. This shows that our English way of letting everybody fish for himself as best he may, with little or no external help, is not such a bad one after all. If it does not raise unartistic incapables into decently mediocre architects, like the French school training, at least it does not cramp with its ready-made formulæ heaven-born genius. This is the last and perhaps not the least lesson which the Geneva Victoria Hall is capable of teaching us.

Geneva : November 28, 1894.

BYGONE SURREY.*

SURREY presents within its limited area more contrasts than any of the larger English counties. The northern part is metropolitan and cockney, while elsewhere it merges into the rusticity of Hampshire, Sussex and Berkshire. "As high as Crooksbury Hill," says COBBETT, "expressed the utmost degree of height," and from what we have seen of them we believe there are people still near that pleasant spot whose notions of mountains are no less simple. To some of them a visit to London is as eventful as it was to their grandfathers. In all Europe there are no more squalid places than are to be found about Southwark, while there are many other parts of Surrey so delightfully picturesque that several LINNELL families could find employment in painting them. It was the remarkable variety of Surrey which struck travellers in the old days, for, says AUBREY, "it has been likened by some to a coarse cloth with a rich bordure or fringe, the inner parts being less fruitful than the skirts."

From its position Surrey was not, however, adapted to be the theatre of many great events. It was too near the city to be suitable for plots of any kind, although that of the barons against King JOHN came to a victorious end in an island forming part of Egham parish. The history of Kingston-on-Thames, if we were acquainted with it, might have been eventful, but the Saxon kings did not possess a Court newsman. "Bygone Surrey" does not, therefore, suggest epic themes. It produced many great men, but what was memorable in their lives was performed beyond the boundaries of the county.

The editors of the volume about Surrey, which forms part of a "Bygone" series that is produced in Hull, have to be content with such peaceful and homely subjects as the following:—"Historic Surrey" (in which it is admitted that no very important events can be recorded), "Primitive Surrey," "Lambeth Palace," "The Dialect of Surrey," "Ancient Roads and Ways," "Folk-lore and Local Customs," "Southwark in the Olden Time," "Mediæval Croydon," "Wanborough," "Battersea and Clapham," "Nonsuch," "Notes on Guildford," "A Forgotten Borough," "Early Surrey Industries" and "Bygone Merton." All these are excellent subjects for essays, and what is said about them may reveal to many that Surrey still presents much which is worth the consideration of studious men.

To Londoners the essay on Lambeth Palace, by the Rev. J. CAVE-BROWNE, will be particularly attractive. Many of them who appreciate the antiquity of the buildings may not understand how the Archbishop of Canterbury gained a footing so near Westminster. The site was presented by EDWARD THE CONFESSOR to his sister, who transferred it to the see of Rochester. As the land was marshy and unprofitable, there was no difficulty set up when the far-seeing Archbishop BALDWIN offered to exchange some pastures at Darenth for it, in order that he might erect the residence which was needed for him as chief justiciary of the kingdom, and which would allow him to be freer from local influences than at Canterbury. But it was not easy to be a reformer in the twelfth century, and BALDWIN preferred to join the Crusaders rather than realise his plans at Lambeth. HUBERT WALTER, the prelate whose name is associated with important events of the reign of RICHARD I., was hardly more fortunate. The monks of Canterbury feared the loss of some of their privileges if a building were erected which could be used

for an independent chapter-house, and the supreme authority in Rome agreed with them. The walls were, therefore, demolished. After a long delay the buildings were again undertaken by another prelate. In the latter part of the thirteenth century the buildings appear to have been neglected, for URBAN IV. issued a mandate ordering them to be repaired or renewed. The turret staircase was among Archbishop LANGTON'S additions, and when other parts were cleared away by Archbishop CHICHELE in the fifteenth century it was preserved. Much of the interest attached to the palace arises from the room known as the "Lollards' Prison," and views of it are given in illustrated descriptions of London, with a martyr for conscience' sake chained to its walls. There is no evidence that a Lollard was ever confined in Lambeth, "nor was the tower," says Mr. CAVE-BROWNE, "ever associated with the name of Lollards for at least three hundred years" after their time. That is not the only illusion about the old sect. In the floor of one of the upper rooms there is an opening, and the official showman used to suggest it was made for the purpose of getting rid of the Lollards by turning them into the river. The fatal passage is, however, only a substitute for a Lambeth glazed drain-pipe. The palace, like many another building, has secured interest under false pretences. Although there are no tragic associations around it, the great hall now, used as a library, is the most satisfactory part of the group. Yet it also is not free from being a sham, for it is not so old as it looks. PEPYS was not far wrong in calling it "a new old-fashion hall." The old hall was demolished in 1648. When JUXON, who accompanied CHARLES I. to the scaffold, became Archbishop, he appeared to be under the obligation to reconstruct the hall, and as faithfully to the old lines as was practicable. In order that his death might be no obstacle to the completion of the work, he made a will with the following clause:—"If I happen to die before the hall at Lambeth be finished, my executor to be at the charge of finishing it, according to the model made of it, if my successor give leave." It was not easy to imitate Gothic in those days, and JUXON had to expend more than 10,000*l.*, which was equivalent to an expenditure of ten times that amount in our time. One of the windows was made up by Mr. BLORE, an architect who restored without destroying, out of fragments of ancient glass discovered in other parts of the palace.

The palace at Croydon was another residence of the Archbishops. Mr. KERSHAW says it dates from 1273, "and on this their country abode some of the architect Primates bestowed much loving care and skill." There is much else in Croydon which tells of archiepiscopal power, and great industry has been shown by Mr. KERSHAW in unravelling the history of "Mediæval Croydon."

Neither Lambeth nor Croydon can be considered as bygones, but that title is applicable to the royal residence "Nonsuch," which is also described by Mr. KERSHAW. The design is ascribed to ANTHONIO or TOTO DELL' NUNCIATA, a Florentine, and it appears from the records of the Huguenot Society that an ANTHONY TOTO and his wife lived at Mitcham. The building, if we can rely on the old views, was not Italian in style, but rather a foreign interpretation of the English style, and we can imagine that the arrangement was due to HENRY VIII. So corpulent a king was not likely to admire grand stairs, and accordingly the greater part was only one storey in height. But as the views around were enjoyable, there were towers available for all who cared to climb. HENRY VIII. was not inclined towards moderation, and having decided to employ mythological figures in decorating the building, they were introduced wherever there was a spot to sustain a statue or a blank space to contain a picture, relief, or plaque. CAMDEN wrote:—"It has such a profusion of animated statues and finished pieces of art rivalling the ornaments of ancient Rome itself that it justly receives and maintains its name from them." Long afterwards, in 1665, when Nonsuch had declined, and the brilliancy of painting and gilding succumbed to the influence of the English climate, we find Mr. PEPYS testifying that it was "a fine place." According to him, "all the house on the outside filled with figures of stories and good painting of RUBENS's or HOLBEIN's doing, and one great thing is that most of the house is covered, I mean the post and quarters in the walls, with lead and gilded." There is much interesting informa-

* *Bygone Surrey*. Edited by George Clinch and S. W. Kershaw, M.A., F.S.A. London: Simpkin, Marshall & Co. Hull: W. Andrews & Co.

tion about the erection of the house in Mr. KERSHAW'S essay. After the King's death Nonsuch became the property of the Earl of ARUNDEL, from whom it was purchased by Queen ELIZABETH. The peculiar appearance of the building is suggested by the story that on seeing the metal on the roof, and it may be elsewhere, illuminated by the sun, the Queen imagined there was a conflagration. As her infallibility could no longer be accepted at Nonsuch, ELIZABETH was disgusted with the building and no longer resided there. Out of loyalty few writers of that age cared to extol the place. In course of time Nonsuch, having fallen from high estate, was used, like Hampton Court at the present time, as a retreat for courtiers. The report of CROMWELL'S surveyors in 1650 is complimentary to the buildings in spite of the Royalist associations. The gatehouse is said to be "very strong and gracefull," with rooms that were "very pleasant and delectable for prospect." In another part the lower storey is said to be "well-wrought freestone and the higher of wood," richly adorned and set forth, and garnished with variety of statues, pictures, &c. CHARLES II. does not seem to have valued the place, and apparently the buildings were used for stores. Hence it was that when the fire of London caused alarm in Whitehall and Westminster, the public money was put into vessels or strong boxes for despatch to Nonsuch. Afterwards the King gave it to his despotic favourite, the Duchess of CLEVELAND, from whom it was bought by Lord BERKELEY, in order that it might supply materials for a new house, "The Durdans," near Epsom, which was burnt in 1764. Of the fantastic Nonsuch not a relic has survived. On the ground now stands a house designed by JEFFRY WYATVILLE.

Surrey could hardly fail to be sought after as a dwelling-place. As many of the residences belonged to men who were notable, the number of names introduced in "Bygone Surrey" is remarkable. BOLINGBROKE'S "Cedar Chamber" still survives. An oval room in a house belonging to Mr. THORNTON, on Battersea Rise, was designed by WILLIAM PITT. MACAULAY, in his early days, lived and was taught at Clapham. Sir CHARLES BARRY spent his later years in the Elms House, Clapham. Bankside, Southwark, was the home of the Elizabethan drama, and to many it is the sacred spot in England, but there is nothing left in wood or stone which can be traced as having a connection with one of the poets or players. CHAUCER has also identified himself with Southwark. But if we were to enumerate all the celebrities that were connected with the little county we should require more space than is at our disposal, and it will be better to send our readers to the interesting little volume which Messrs. CLINCH and KERSHAW have been enabled to produce.

TRAINING OF ARCHITECTS.

THE first lecture of a course on the "History of Architecture" for the present session has been delivered by Mr. Arthur Hill, B.E., F.R.I.B.A., at the Queen's College. He said:—Before commencing the subject-matter of these lectures a few words on the training of an architect may not be astray. In the first place, we need some definition of architecture itself before any attempt can be made to say how it should be studied. Painting, sculpture and architecture are sometimes called the "three sisters," implying a similarity of characteristics that do not exist, for it is impossible to compare the freedom of the painter or the sculptor with the subservience to practical considerations that always governs architectural work, a control that often renders the development of artistic qualities more difficult than in the cases of painting or sculpture. All building from its nature must be scientific, therefore architecture must be regarded as a science, and as a science as well as an art. Architecture without art is mere building construction. A building may be admirably put together, every brick serving its purpose, the doors wide enough, the windows admitting sufficient light and properly weather-tight, yet the whole pile may be so utterly uninteresting that no one would look at it a second time except to wonder at its ugliness, while you can imagine another building with equally convenient doors and windows, yet possessing something in its grouping or proportions that converts it from a lifeless pile of bricks into a work of art, fascinating the observer and compelling his admiration. In an architect's training this two-sided characteristic of his profession must never be lost sight of, the artistic strain should neither dominate nor be crushed by the constructive, but both should be developed side by side.

Until quite recently the necessity for any special training for architects was not recognised. The action of the Royal Institute of British Architects in requiring its members to pass an entrance examination has brought the matter forward, and now in several places efforts are being made to meet the obvious need, but nowhere, so far as I know, has the co-relationship of science and art in the same school been thoroughly carried out. We have science schools without art and art schools without science. The engineering course of the Queen's Colleges was arranged fifty years ago, at a period when there was very little appreciation of art of any kind; and though admirably adapted for the needs of that day, the great era of railway making, it is not broad enough for the culture and artistic development of the present day, nor sufficient for those who are destined to practise the art of civil architecture.

From the moment one begins to build, to rear an edifice of any kind, whether of brick or of iron, the building should not only be structurally sound, but should also in some degree minister to that inherent love of ornament which is strong in the human race. I look forward to the development of an architectural school in this and other universities which would take its place side by side with the engineering school and supply an important link between the arts and sciences—a link that would tend to make engineers more artistic and architects more scientific. But there is no use referring further to existing deficiencies in the means of education; it will be more useful to take the existing opportunities. In Cork there are two institutions where the basis of an architect's training may be obtained, namely, the Queen's College here and the School of Art. Although the work in these two institutions is not linked together as would be desirable, yet the educational opportunities in Cork are not at all to be despised, and present an extensive field to any industrious student. An exhaustive knowledge of materials is the beginning and end of an architect's training; he should not only be conversant with the best and customary methods of construction, so that all materials may be brought into service in the most scientific way, but he should also possess a more technical knowledge of the characteristics they possess, so that from an artistic point of view they may be made to bear suitable and appropriate ornament. The School of Engineering is designed to deal with materials and structures from a purely scientific standpoint, and a student could not spend his time more profitably than in attending the engineering course, which contains a great deal that is essential and scarcely anything that is unnecessary for an architect to know. He should for the development of his artistic faculties attend the School of Art at the same time, and endeavour to obtain the power of expressing form in every possible way, not only in outline, shading and colour, but also by modelling in relief. With respect to the special course of lectures on the "History of Architecture," it would be the lecturer's object to show what the combination of art and building construction has accomplished from age to age in many different parts of the world. A knowledge of the historic styles of building and ornament, together with some idea of archæology, is quite as important to an architect as any other branch of study that can be named, not as an end in itself, but as a means to an end. The most perfect familiarity with the appearances and details of all the great buildings of Christendom will not make an architect. One must go beyond the mere features of a building as it stands, and ascertain how and why it has attained its peculiar form, and to what elements it owes its beauty, whether it is due to size or proportion, to the variety or unity of its parts, to elegant simplicity or rich ornament. Nothing can be more instructive than a consideration of the way in which difficulties were overcome and the various wants of mankind supplied. The lecturer then proceeded to illustrate the Doric architecture of Greece, and with the aid of two lanterns exhibited some excellent photographic views and diagrams. This mode of showing two pictures at the same time afforded excellent opportunities for comparing and contrasting different buildings.

THE PROPOSED CHRIST'S HOSPITAL SCHOOLS.

BY direction of the Council of Almoners a statement on the work of Christ's Hospital for the three years 1891-93 has been submitted for the information of the Charity Commissioners. Although considered by the Council in February and March, its publication has been delayed and indeed many of the matters referred to in it are still incomplete, and are likely to be so for some time. The new scheme for the administration of the Hospital became law on August 15, 1890, but the Council of Almoners did not have control of its affairs until January 1, 1891. "From the first," says the report, "the work of the Council has been very seriously hampered by financial difficulties. The income from donations and legacies, which

had been gradually decreasing since the passing of the Endowed Schools Act, 1869, has now practically ceased, the only receipt from this source since the passing of the scheme being a donation of 500*l.*, in respect of which the donor has been elected a Governor. As all donations and legacies received have now to be invested, they can no longer be treated as income. During the year 1890, stock was sold to the value of 9,823*l.* 2*s.* 2*d.* to meet liabilities, and although there was a balance carried forward to 1891 of 3,752*l.* 6*s.*, 3,721*l.* 18*s.* 2*d.* of that amount actually belonged to the old governing body, so the year 1891 was practically commenced with no balance in hand. The income available for school purposes in 1891 (exclusive of the exhibitions fund) was 47,668*l.* 14*s.* 2*d.*, and the expenditure 57,777*l.* 7*s.* 9*d.*, a difference of 10,108*l.* 13*s.* 7*d.* To meet this deficiency, and to provide for current expenses, stock was sold the following year realising 12,073*l.* 10*s.* The income for 1892 available for school purposes was 50,118*l.* 6*s.* 5*d.*; and by strict economy and the reduction of the number of children the expenditure was reduced to 52,343*l.* 16*s.* 6*d.*, showing a deficiency of 2,225*l.* 10*s.* 1*d.* The contributory clause of the scheme has done very little to help the Hospital's income.

"The scheme requires that the Council of Almoners shall provide upon convenient sites buildings suitable in the case of the boys' school for 700 boarders, in the case of the girls' school for 350 boarders, and in the case of the preparatory school for boys for 120 boarders. In choosing a site the Council decided it would be to the advantage of the foundation to secure at the outset a sufficiently large area to enable them to extend the premises if necessary hereafter, and to reap any advantage there might be in disposing of the surplus land at a building price. From the numerous offers submitted from time to time a committee of the Council put on one side those which from the limited size of the estate, the situation, the soil or the price did not appear to be suitable for the Hospital's purpose and they visited upwards of forty properties, which seemed from the plans and particulars furnished likely to meet the Hospital's requirements. Upon the recommendation of this committee the Council, on June 1, 1892, decided to negotiate for the purchase of the estate of the Aylesbury Dairy Company, near Horsham, at which the line of the London, Brighton & South Coast Railway branches to Brighton, Portsmouth and Guildford. The company have agreed to build a station on the estate, and to give cheap fares and exceptional facilities for reaching it. The property consists of nearly 1,100 acres, and is situated on rising ground commanding varied and extensive scenery between the Surrey Hills on the north and the Sussex Downs on the south, and possesses natural advantages which render it valuable for the purpose required. The Council having resolved that it is desirable that the London school should be vacated at the earliest possible time, a committee has been appointed to consider the best means of dealing with it, so as to provide funds for the erection of the new buildings, and for carrying on the schools until such buildings are ready for occupation. They have reported that it would be a pity to force the Hospital's site into the market, and that it would not be politic to advertise until some arrangement has been come to with the Governors of St. Bartholomew's Hospital, who are willing purchasers of a portion of the site. The Council have authorised negotiations with the Governors of St. Bartholomew's on the principle of arbitration, and have ordered that the remainder of the site be planned out by a competent architect for letting in building plots, that it be carefully valued, and that offers be then invited either for the sale of such plots or for taking them on building lease.

"Mr. Rogers Field was asked, on November 10, 1893, to report upon the water-supply and drainage of the proposed new schools, and he advised, on January 10, 1894, that a boring be sunk to ascertain the quality of the water in the Tunbridge Wells Sand lying beneath the estate, the supply from the present shallow wells being surface water and liable to contamination. He also suggested means for the disposal of the sewage and the drainage of the estate. A report on the general healthiness and sanitary condition of the district of Stammerham and Itchingfield, and its suitability for the purposes of a large school was received on March 27, 1894, from Dr. Charles Kelly, the medical officer of health for West Sussex, who reported 'that the conformation of the land, the free exposure to air currents, and the open sunny aspect of that portion of the Mid-Sussex Railway render it very suitable for building purposes.' A special committee of the Council have the reports of Mr. Rogers Field and Dr. Kelly under careful consideration, and have reported that the statistics of diseases adduced by Dr. Kelly remove sufficiently the apprehensions which might have been entertained in consequence of Mr. Rogers Field's analysis of the soil, and that the Council would be justified in acting on Dr. Kelly's conclusion, that 'the estate is suitable for the purposes of a large school.' This report was adopted by the Council on May 2, 1894, and in accordance with Mr. Rogers Field's advice, a boring was sunk from the bottom of the Dairy Well, at Stammerham. At a depth

of 212 feet from the surface hard beds of ironstone rock and blue shale were found. The quantity of water in this stratum was tested, and after a week's continuous pumping with a 6-inch pump the yield of the borehole, 150 feet from the surface, was found to be 30 gallons a minute. The boring is being proceeded with, and a sample of the water has been sent for analysis.

"The judges made their award in favour of the design submitted by Messrs. Aston Webb & E. Ingress Bell; and recorded their unanimous opinion that such design most closely fulfils the instructions, is the best in point of arrangement, is the cheapest to carry out, and is on the whole the most suited for the Hospital's purpose. The design has been referred to the building committee with instructions—(i.) To prepare and consider an approximate estimate of the probable income and expenditure of the foundation for the next six years (on the assumption that the buildings will be proceeded with), and of the number of children that can be maintained and educated in the meantime and afterwards; and (ii.) To consider what alterations are necessary in the design, and how it can best be modified in view of the Hospital's finances, and to report."

THE NEW BOY-ARCHITECT.

THE members of the Northern Architectural Association held a meeting in Sunderland on Saturday night last, when Mr. Frank Caws read a paper on "The Architect." The chair was taken by Mr. Wm. Milburn.

Mr. Caws said he addressed himself to the youngest members especially, and would express to them, as well as he could, the true architect as he appeared to his vision. In order to become an architect worthy of the name a boy must have at the start much more than the average measure of passion for the beautiful and of perception of the true, and moreover he must cultivate these gifts with more than ordinary assiduity and more than common delight. It was a fair subject for discussion, which of the two gifts, if either—the practical or æsthetic—should take precedence in the training and development of the boy-architect. Did not Nature teach them not to try to force the mind of the young boy-architect to become severely practical before the proper time? Did not all boys become naturally more practical as they grew older? It must be admitted, however, that circumstances altered cases. The boy who was too prosy should be urged on the æsthetic and discouraged on the practical side of his tastes, and he who seemed too excessively romantic should be earnestly exhorted to become more practical. Still, after making every allowance for the special circumstances of each case, he held strongly that, generally speaking, they should give precedence in youth to the poetic faculties, because they were the more sensitive to injury from discouragement and neglect, and in the order of Nature their turn came first. To cultivate, exercise, enlarge, strengthen and refine that human-divine gift which we call soul, the youth must not be kept for too many weary weeks together merely making plans and tracings of hideous rows of street houses or workmen's dwellings, nor at the squaring, day after day, of endless columns of duodecimals, nor in running to and fro perpetually to corporation officials about drains and middens, though it followed that attention to duty, however disagreeable, was of all lessons the one he must most thoroughly acquire if he would preserve his soul's best self alive; and, moreover, the very dryness and distastefulness of some of his duties would serve as a foil to render all the more intensely enjoyable those of his studies which were of a more artistic complexion. He must read noble and inspiring books, he must watch sunrises and sunsets, he must not spend all his time poring indoors nor half his time sporting out of doors. If he was first class at football he would not be likely to be first class at architecture. He must be meditative, wandering in the fields and on the sea-beach to fill his eyes and heart with the lovely coquetry of sunlight and shadow, and growing increasingly familiar with Nature's harmonies, discords, mysteries, and romances. He must frequent cathedrals, and learn to sit still in quiet churches. Frequent attendance at music-halls and theatres was calculated to excite unduly and artificially the taste for the beautiful, and to induce a mental unrest which rendered the boy architect less in tune for his normal studies and observations. His taste should be based on the solid and the really enduring rather than on the ephemeral creatures of Art and Nature. Without being nervously anxious and overwrought, the young student must be quietly in earnest. The mental organism of the boy architect was to be so specially devoted to the service of Beauty and Truth that even in the innocent pleasures of theatre, concert, or football field—indulged in to excess—he might deviate rather than refresh the energies of that brain and soul, and fail of attaining the standard of excellence which was the high mark he aimed at. Utilitarians might ask, "Why should young architects, who will never have the ghost of a chance to build a cathedral, spend so much time and thought on cathedrals?" It was not that they might be

equipped for designing cathedrals—though who could tell that they might not be called upon to do so?—but that they might become so imbued with the spirit of holy beauty that it might in the after years of their early manhood inspire and pervade all their efforts, even in the designs which they were employed to make for much humbler buildings. Similarly, the boy architect should be keenly alert to study the ever-changing glories of the sky, with “its gorgeous towers and cloud-capped palaces” of mist and flame, not that he might design and build moonrises or sunsets, but in order that his soul might be refreshed and strengthened to withstand the chill and deadness, the blight and mildew, with which, too often, a money-grubbing and abidly utilitarian age infected the young and unfilled spirit, robbing enthusiasm of its edge and cankering its brightness. In this work-a-day world the boy architect must needs, by communion with all that is nobly ideal in Literature, Art and Nature, so confirm his own inborn idealism that he might to the end of his career continue to be a great dreamer as well as a great realiser. No man who is not a dreamer is or can be an architect. He must learn to express what he feels. Let him attempt to do so while as yet his eye was not skilled to instruct his hand, and while as yet his ear had not learnt to direct his tongue. The proper medium of expression which the young architect must bring into subjection to his thought was not the tongue, but the hand, not the word, but the line. All his dream power, let him strengthen and refresh it as he might, would be wasted if he did not at the very beginning learn to draw. Some of the greatest orators had known only their mother tongue. Likewise some of the greatest architects had been proficient only with the pencil and pen. But if the architect was able also to draw with brush and colour, with modelling tool and with clay, and with carving blade and wood, so much the better, just as the linguist orator was better furnished than he who was master only of one language. Before the young architect could hope to draw his dream, which was unseen, he must learn to correctly portray the dreams of other architects which had been petrified into solid substance and visible forms. No power of imagination, no strength of conception could compensate the architect for weakness or non-proficiency in the art of drawing. The young architect should talk little and draw much. He should have no mercy on himself short of acquiring that absolute harmony and working understanding between eye and hand, by which alone his thoughts could take shape and permanency. Having by severe self-criticism, an essential habit to the successful student, and by untiring dogged perseverance become, at a comparatively early stage of his education, an accomplished draughtsman, a young architect during the same period of preliminary training must necessarily have become proficient in the science and practice of linear perspective. The genuine architect always, he said, thinks in perspective, while the self-styled architect thinks in mere plan or elevation. In order to transfer his dreams from paper to timber, brick, iron and stone, the architect must further learn how to draw, so to speak, with the plane, trowel, hammer and chisel, his pictures in the open air, by the hands of the carpenter, bricklayer, smith and mason. To do this he must acquire practical and scientific knowledge. He must become a geometrician and mathematician. He must also become a man of business. The motive was sufficient. The student would come to understand that nothing short of perfect artist plus perfect engineer could constitute the perfect architect. He would understand that the true architect was the priest whose high vocation it was to wed fancy to fact, to unite beauty to utility. There was a danger that the fascination of pursuing the manlier functions of the engineering part of his profession might render him a mere materialist, the ideal being overshadowed and absorbed in the real. He was therefore called upon for the remainder of his career to be on his guard against allowing either of the functions of his dual nature and office to get out of proportion and adjustment and usurp the rights of the other. It was a question of focus. So long as he succeeded in so governing and balancing the two influences of which his work was the outcome, he remained an architect. That was to say, so long as he continued to both dream and build he remained a creator. So long as he could only dream he was an impotent ghost. When he could both dream and draw he became what the theosophist would call an “astral body,” an artist—a cross between a ghost and a man. But when he could dream, draw and build, and could, moreover, continue to do so, maintaining in spite of the materialising influences and the commercial duties of his daily life as a busy man of affairs the proper balance and equipoise of all his natural endowments and accomplishments, he was and remained—at least in his (the speaker's) regard—that most completely developed man of all sorts and conditions of men, the architect.

A discussion followed, and the meeting closed with votes of thanks to Mr. Caws and the Chairman.

The Sales at the Glasgow Water-Colour Exhibition have made up a total sum of 1,544*l*.

TESSERÆ.

House of Honour, Peterborough.

THERE is a very common popular delusion that Gothic architecture was used for churches and chapels and monasteries only; but this is altogether a mistake, arising from the fact that our houses have generally been rebuilt by each succeeding generation according to their own ideas of comfort and convenience, while our churches have remained as they were built to a great extent. In consequence of this error, whenever a Gothic window is seen in any old building or ruins it is immediately called a church or chapel window, although it is quite often the window of the hall; there is, in fact, no difference externally between the window of a church and of a hall of the same period. Internally there are usually seats in the recess of the hall window for ladies to sit and work at their tapestry; this is often the only distinction between a hall and a chapel when the traces of the altar have been destroyed. Within the precincts of the great monastery of Peterborough, in the most retired part, close to the east end of the infirmary chapel, there still remains a small Early English house of about 1220, nearly perfect, with windows having remarkable plate-tracery in the heads. It is supposed by Professor Willis to have been the “House of Honour,” or guests’ house; or it may have been the house of the infirmary, who was an important officer in the larger abbeys. The house is divided into two parts by a partition wall, on one side of which is the hall, which is the whole height of the building; the other half is divided into two storeys by a floor, and this is part of the original design, as shown by the doors and windows.

Late Perpendicular.

The Perpendicular style is frequently assumed to terminate with the reign of Henry VII., but this is an error, though a very common one. Buildings assigned to Henry VII., on account of their being Gothic, are very often really of the time of Henry VIII. Although the Renaissance style had begun to come in, it went on very slowly at first, and very good examples of the Perpendicular English Gothic are preserved both in churches and in houses, not only of the time of Henry VIII., but later also, and many large buildings begun under Henry VII. were not finished until Henry VIII. or later, as at Windsor, at Oxford, and in Cambridge and Somersetshire, to a remarkable extent, and in many other counties. It appears that when the monks saw the probability of the abolition of their tenure, they spent as much as possible in building and ran into debt largely in doing so, in order to evade the loss of property in the expectation that the storm would blow over, and that their successors would benefit by the sacrifice they made. When the royal commissioners took possession of the monasteries, they frequently found a large number of buildings only half finished, and heavy debts to be paid off before any residue could be found for the commissioners to sell.

Cicero and Amateurism.

Cicero, in his second oration against Verres, speaks of objects of art as contemptible, and says that the forefathers of those whom he addressed allowed the peoples whom they had made tributary to retain them as an amusement and consolation in their slavery. In a curious passage in the “Paradoxa” (v. 2) the orator, enraged probably at seeing that the taste for these puerilities grew and increased around him, brings forward the very strange argument that, as in a house the slaves who were entrusted with the care of the objects of art held the lowest rank, so those who passionately loved such objects were in the lowest depth of slavery. It is, however, only just to Cicero to remember that Roman luxury easily ran riot, and that the crimes which Verres, the great collector of the day, had committed in amassing the treasures of art which he possessed, and doubtless the extravagant and affected admiration of the adulators of Verres and such as Verres were reasonably offensive to the patriotic statesman. Cicero himself did not wholly escape from the infection, for not only did he ornament his villas with statues and paintings, but he even expended a million of sesterces (some 8,000*l*.) in the purchase of a table of “citrus,” the modern thuya.

Scagliola.

This is a mixture of gypsum and powdered selenite, made into a paste with glue, upon which paintings can be made. The process is as follows. Upon a tablet of white stucco, formed of this plaster of Paris paste, the outlines of the work designed are traced with a sharp instrument, and the cavities thus made are filled in with successive layers of the same composition, but coloured. The application of the different layers is continued until all the varieties and shades of colour are produced, after which the surface is polished. The invention of this process is usually ascribed to Guido del Conte, an ingenious mason of Cari, near Correggio, in Lombardy. Guido's scagliola was a complete imitation of marble; his pupil, Annibal Griffoni, imitated small pictures, engravings and oil-paintings; while Gravignani represented the rarest sorts of marble, covered with delicate tracery and interspersed with figures.

NOTES AND COMMENTS.

OUR archæological societies in their periodical excursions provide pleasure and knowledge for themselves and also for the general public when they secure the company of a competent member of the Press to record the proceedings. It is seldom that we can see recorded any description of the unknown district within five or seven miles of London. No casual visit will do justice to the antiquities so near London. Lately the energetic Society known as the Upper Norwood Athenæum has had the courage to invade the very interesting country in the north of Middlesex. In a recent excursion they visited Edgware, Little Stanmore and Great Stanmore, and within the last week visited the collegiate church of St. Saviour, Southwark, the restoration of which is now nearly complete, under the direction of Sir A. W. BLOMFIELD, A.R.A. No society can visit a district in the neighbourhood of London without being interested in what they see. But it has been so neglected that the descriptions do not touch the fringe of what we possess. In the visit to Stanmore, after the President's address it remained for Mr. POTTER to throw extra light on the history of the buildings visited. Even he failed to say what is feared by many about Whitchurch, an historical building for which the Duke of BUCKINGHAM had secured HANDEL as organist, that it may soon be valueless for want of repairs. The Society mention that the Chandos monuments were under repair, but the preservation of this historic building should interest all antiquarians.

It is hard on contractors to have it proclaimed to the world by the London County Council that they charge exorbitant prices. But still more unbearable is the statement that the amateurs of the Council can produce superior work. MESSRS. REED, BLIGHT & CO., Limited, who have carried out the contracts for the asylum at Claybury, the artisans' dwellings in Poplar and Limehouse, besides other works, have challenged the statement of the Council, and suggest that a committee of experts be at once appointed to verify it. They are willing to pay 50*l.* to an hospital if it should be discovered that any of their works are not equal in quality and materials to those executed by the London County Council. MESSRS. REED, BLIGHT & CO. must be innocent if they imagine that the aim of the majority of the Council is either to produce excellent work or to diffuse truth. What is sought after is deluding the greater number of the inhabitants of the metropolis into the belief that there are no such guardians of London as the Council, and we must not suppose such an end can be attained by careful language or enduring construction. Conviction is expected to be gained by force of contrast, and it is no wonder, therefore, the works committee are made to appear very white and the contractors very black in the representations prepared by the Council.

ONE of the disadvantages of building theatres on the sites of houses in streets was seen in an action which was brought against Mr. W. EDOUN, the lessee of the Strand Theatre, by the lessee of an adjoining house, which was tried before Mr. Justice WRIGHT on Tuesday. When the theatre was built, from motives of economy the frontage to the Strand was limited to as much ground as would afford an entrance-hall to the principal part of the house; the remaining parts were entered from a narrow street at the side, at the corner of which the plaintiff's house is built. There is also a house which belongs to the theatre, now let to Mr. SWANBOROUGH. The buildings may be said to be dovetailed into one another, but there was a very small area which was left open between them at one point. It was large enough to hold a gully, into which down pipes from the buildings drained. Twelve years since a flat roof was placed over the area by a former lessee of the theatre, but, as it caused a diminution of light to some of the plaintiff's windows, it was arranged that the open area up to a height of 7 feet should be considered as part of plaintiff's premises. The flat roof was formed, and although the pipes were supposed to have been unaltered, yet water accumulated on the roof and found its way into plaintiff's house. As often happens in such cases there was only restricted access to the roof, and the question to be decided was the responsibility for the damage. Mr. Justice WRIGHT

gave an elaborate judgment. While admitting the right of a man to have his premises uninvaded by anything injurious from his neighbour's land, he said the right was subject to qualifications. It might be shown (1) that the damage resulted from the act or default of some third party. (2) That the land was used in an ordinary and reasonable manner, and the damage happened without wilfulness or negligence. (3) If the plaintiff consented to the defendant collecting water on his (defendant's) land the defendant would not be liable for the consequence in the absence of negligence. In the present case his lordship said the defendant did no more than was ordinary and reasonable in conducting his own water from the roof to the gully, which was for the common benefit, and impliedly and, he should also infer, actually attended to by the plaintiff. The defendant was, therefore, not liable unless upon proof of negligence, and he saw no sufficient evidence of negligence. It might be alleged that defendant failed to examine the gutter. He was not prepared to say either as a matter of law or as a matter of fact, in the absence of express evidence, that a periodical inspection ought to have been made, or that if it had been made it would have prevented the damage. Judgment was therefore given for the defendant, with costs. The judgment, like some in light and air cases recently given, suggests that a more liberal interpretation of the law is taken in dealing with disputes between neighbours. Houses have to be so closely packed in towns, if the occupants will look upon themselves and each other as representatives of interests that are in opposition, and will find a cause of quarrel in a straw when honour is supposed to be at stake, there would be endless litigation. Surveyors, therefore, who advise arrangements which will keep cases out of court are not likely to be condemned by the judges.

STUDENTS who are desirous to become acquainted with the principles of mechanics and hydrostatics will find them clearly explained in the "Text Book" by Mr. HERBERT HANCOCK, M.A. (SAMPSON LOW, MARSTON & CO.). It is not easy to adopt a treatment of subjects so familiar that is not stereotyped, but the author has succeeded in that way. His explanations are very clear, and the numerous diagrams remove any difficulties which may arise in the minds of novices. At the end of each are test questions and problems. Copies of examination papers are also given. It can be recommended as a guide to the latest methods of dealing with the subjects.

It would be interesting to know how many actions have been fought in the law courts in order to determine the number of cube feet in a ton of timber. The latest came before the Scottish courts in Edinburgh. A firm of timber merchants in Glasgow sued the Caledonian Railway Company for repayment of excessive charges. It was alleged that the company assumed that 50 cube feet of deals and battens were equivalent to a ton. It was allowed that a measurement ton of 50 cube feet for logs is correct enough for practical purposes, but deals and battens are much lighter, and consequently 70 cube feet to the ton would be a fair assumption. The company maintained that their weight clause was inapplicable to deals and battens, which were subject to special rates. After all the litigation the case was, however, withdrawn on Tuesday, and the lawyers are the only gainers.

THE number of Roman villas in England is now increased, for one has been unearthed at Darenth, in Kent, and there is a supposition that it is only a part of a group of villas. The remains are not entirely exposed, but enough is revealed to prove that the villa was rather large. The outer walls are of flint and about two feet thick. It is evident that two of the rooms were paved with brick tesserae of small size, while in others tiles were used. There was a large hall which is not entirely uncovered. The land on which the villa was found belongs to the Ecclesiastical Commissioners. The tenant has given facilities for the excavations, and in fact a sub-lease of the field has been obtained. The operations are conducted by Mr. GEORGE PAYNE.

THE FULHAM CONSERVATIVE CLUB.

THE rapid and unprecedented growth of the population of the borough of Fulham, and the consequent increase in the number of the electors, has necessitated the extension of the Fulham Conservative Club premises to accommodate the additional members and to provide improved offices for the Registration Association. The committee have been able to make arrangements by which the sum of 2,000*l.* has been applied towards the enlargement of the premises, the freeholder having renewed the lease of the present building for ninety-nine years, including the piece of vacant ground adjoining, 37 feet frontage and 70 feet deep, on which the new buildings are situated. In the new portion there will be a wide vestibule, with swing doors opening into a spacious hall, opposite to which will be the staircase leading up to the large hall, which will be 45 feet long, 28 feet wide and 16 feet high, with a retiring-room attached. On the ground floor the front will be occupied by offices for the Registration Association, having a separate entrance from the vestibule, and at the back there will be a billiard saloon for two tables, with lavatories, &c., adjacent. The old premises on the left of the entrance will be altered so as to increase the size of the smoking-room, bar and kitchen accommodation. The front is faced with Bracknell red bricks and Box ground dressings. The floors are pugged with slag wool to deaden the sound, and the billiard-room and main hall are specially ventilated.

The work is being carried out in a substantial manner by Messrs. TURTLE & APPLETON, of 171 St. John's Hill, S.W., under the superintendence of Mr. HUGH T. PORTER, of 76 Santos Road, West Hill, Wandsworth, S.W.

BEEHIVE INN, STOCKPORT.

THE Beehive Inn, St. Petersgate, Stockport, which has recently been rebuilt for Mr. DANIEL CLIFTON, brewer, of Stockport, is of local pressed and moulded bricks, with dressings of Darley Dale stone. Internally expense has not been spared, there being mosaic floors, richly-tiled walls, oak staircases, stained and embossed plate-glass windows and screens, walnut furniture, fittings, &c. Messrs. P. PEIRCE & SON, of Stockport, were the architects.

READING UNION WORKHOUSE.

THESE buildings have recently been very considerably enlarged and entirely remodelled. On the afternoon of the 28th ult., the architects, Messrs. Charles Smith & Son, met the Reading Literary and Scientific Society, with a large number of other visitors, and conducted them through the establishment.

In the course of a paper read by Mr. Charles Smith to the Society, he said that the new buildings as now enlarged and remodelled had been arranged for the accommodation of about 500 inmates, namely, 156 in the hospital and 344 in the general workhouse, in addition to which accommodation for forty-five vagrants had been prepared. In arranging the new scheme it had been necessary to enlarge, not only sufficiently for the additional number to be accommodated, but also to bring the buildings up to the modern requirements of the Local Government Board as to cubic space for the entire number.

The first difficulty that presented itself was that, in 1867, the buildings were erected close up to the eastern boundary of the property, the division between the sexes then being from north to south parallel with this boundary, so that there was no room for enlargement on the female side. Several attempts had been made to meet this difficulty by acquiring additional land on this side of the site, but without success, and ultimately, with the consent of the Local Government Board, the architects had adopted the bolder plan of dividing the sexes east and west instead of north and south, making the old hospital, which was formerly for both sexes, for the healthy women, and the general workhouse, which was for both sexes, to be in the new arrangement for men only. By this means the two main

blocks of buildings were retained. Everything else is to a great extent new, namely, the hospital, the central administrative block, the laundry, the porter's lodge and the receiving wards.

It was also necessary to find accommodation for the vagrants, as it had been determined to abolish the old vagrant wards in the centre of the town and provide new on this site.

The new buildings may be briefly described as follows:—

The Vagrant Wards.—The greater number of the vagrants are accommodated on the associated principle, but separate cells have been provided for special cases.

The Hospital.—The new hospital has been built on the pavilion system, the south pavilion being for men, the north pavilion for women, and the central pavilion is occupied on the ground floor as an administrative block, and on the upper floor as lying-in wards for women. The north and south blocks have four wards, with small special case wards, duty rooms and nurses' rooms, and each ward has a balcony for the convalescent patients for airing in fine warm weather.

As before referred to, two existing blocks of buildings have been utilised for men and women respectively in health.

The Central Administrative Block.—The central administrative block is entirely new, and embraces residence for master, a complete set of stores, new dining-hall, which is also used for Divine service on Sundays, also a kitchen, sculleries, bake-house and new laundry.

The Imbecile Block.—The imbecile block has been so altered that the accommodation which hitherto served for both sexes is in the future to be used for women only. The imbecile men are temporarily housed in another portion of the establishment, a further addition to this block of buildings being contemplated in the future.

Engineering.—The engineering department is very complete, the scheme adopted being to provide from one central source hot water for laundry and baths, and steam for heating, cooking, &c. This work has been very efficiently carried out by Messrs. Benham & Sons.

An entirely new set of water-mains has been laid, to which hydrants have been attached in case of fire. An entirely new system of drainage both for sewage and rain-water has also been laid down, with outfalls into the public sewers in road, and the sanitary arrangements generally have been remodelled in accordance with modern requirements. Hitherto the outfall for drainage had been to the low-lying garden and land west of the workhouse, but this proved to be too near the buildings for a system of irrigation.

The building works have necessarily been carried out in sections and the following have been the contractors, all of Reading:—Mr. G. S. Lewis, the new vagrant and entrance blocks; Messrs. Higgs & Sons, the new hospital, also the board-room and offices in Thorn Street; Messrs. Collier & Catley, the main central administrative block; Mr. Tucker, the imbecile extensions, &c., gas mains, &c. The drainage and sanitary works have been carried out by Messrs. Collier & Catley, of Reading.

In the course of his remarks on the history of the poor in England, Mr. Smith said few questions had presented greater difficulties than dealing with them. In England in the Middle Ages most of the labouring classes were serfs, and looked to the feudal lords to maintain them in return for work, and many of these serfs even when made free became so destitute that they were glad to return to serfdom. The chief difficulty in those times was with the itinerant poor, and severe and barbarous laws were passed against vagabondage and mendicancy, and up to the time of Richard II. pauperism was treated as a crime, and even in the time of Henry VIII. the habitual beggar was ordered to be whipped for the first offence, his ears cropped for the second, and eventually might even lose his life: this latter was however soon repealed and branding the body substituted.

The Church in those days was without doubt the great helper of the poor, especially the monasteries and religious houses. This was proved by the fact that after the dissolution of the monasteries pauperism very greatly increased. Several Acts were passed in Elizabeth's reign, and in 1592 an important Act came into force which authorised a rate called "Week's Pay" to be levied in each parish. Eventually, at the end of Elizabeth's reign, 1601, an important Act was passed which has in some sort formed the basis of the poor-law system in England; it taxed every inhabitant of every parish for the relief of the poor, and to a great extent rearranged the administration generally of the Poor Laws. Many Acts, however, were subsequently passed; for instance, in Charles II. the Laws of Settlement, *i.e.* the deciding to which parish the pauper belonged. This has been always a difficult question, and one leading to litigation.

In 1702 (George I.) the system of farming the poor commenced, by which parish officers could, with the consent of the parishioners, purchase or hire houses, or might contract with persons for lodging, keeping, maintaining and employing the poor, and under this small parishes could unite by voluntary

agreement. This was the commencement of our present system of unions. This system (farming) was, however, open to great abuses, the keepers of these houses making large profits out of the parish, thus getting their labour done at the parish expense. Eventually, in 1783 (George III.), an Act was passed, called Gilbert's Act, when guardians of the poor were appointed, and in 1795 a further Act, a permissive one, was passed for outdoor relief.

Then came the important modern Act of 1834, under which the Poor Laws of the country are administered, called the Poor Law Amendment Act. Under this three commissioners were appointed with a number of assistant commissioners. England was divided into districts, unions formed, and, without doubt, an enormous improvement effected both for the benefit of the poor and at reduced cost to the ratepayers.

During the twelve years previous to 1834, the country expended in carrying out the Poor Laws 76,096,000*l.*, whereas in the twelve years after 1834, even with the increase of population, only 57,247,000*l.*

As showing the importance of this Poor Law question to the community might be mentioned the fact that there were in England and Wales in 1885 800,000 paupers, about one-thirty-fourth part of the whole population, and these were costing the country about 8,000,000*l.* a year.

In 1848 an Act was passed constituting the Poor Law Board the central authority instead of the commissioners, and this became a Government department, with a president, who was a Minister of the Crown, at its head.

Then, in 1871, the Poor Law Board was abolished, and the powers and duties transferred to the Local Government Board, who took charge not only of the control of the administration of the poor law, but more or less over all the local government of the country.

THE LONDON BUILDING ACT OF 1894.*

(Concluded from last week.)

THE height of buildings in old streets, *i.e.* streets laid out before Aug. 7, 1862, is now restricted to 80 feet and two additional storeys in the roof, but towers, turrets, or other architectural features or decorations are excluded from the restriction, as also are churches and chapels. This, however, does not prevent you from completing a building taller than 80 feet if begun before the passing of the Act, or of rebuilding a building which now exceeds those dimensions, or of continuing a row or block of existing buildings belonging to the same owner exceeding 80 feet high to an equal height.

The Council have power to consent to buildings being erected exceeding this limit of 80 feet, but they must within one week after giving consent publish the fact for the benefit of adjoining owners being within 100 yards of the site. These adjoining owners, if they object, may appeal to the tribunal within twenty-one days, and should the Council refuse to consent to any building exceeding 80 feet high the applicant can also appeal to the tribunal.

In a street formed after Aug. 7, 1862, and of a less width than 50 feet, no existing building is to be raised, and no new building is to be erected so that the height of such building shall exceed the distance of the front or nearest external wall of such building to the opposite side of such street, unless with the consent of the Council. A church or chapel is excepted from this section.

Where a corner building abuts upon streets of different widths the height is regulated by the wider street, and this height may return along the narrower street for 40 feet.

The height of habitable rooms is increased from 7 to 8 feet 6 inches except for rooms wholly or partly in the roof, and these may be 8 feet throughout not less than one-half the area of such rooms. This will prevent the formation of three storeys within the limit of height of a 9-inch wall.

Living rooms over a stable have now to be separated from the stable by a concrete pugged floor or floor of other solid construction 3 inches in thickness, and the soffit of the stable is to be ceiled with lath and plaster. The access to the living rooms is to be separated from the stable by a 9-inch brick wall.

We now turn to the additional clauses relating to safety from fire in private buildings and from fire and panic in public buildings.

Every dwelling-house or factory having a parapet is to be provided with a dormer window or door opening on to the roof, or with a trap door furnished with a fixed or hinged step ladder leading to the roof, or with other proper means of access to the roof.

Any storey in the roof of any domestic building the floor of which is 60 feet above the street level shall be constructed of fire-resisting materials throughout, and every new building exceeding 60 feet in height, the upper storeys being 60 feet above the

street level, is to be provided with such means of escape in case of fire as can be reasonably required under the circumstances of the case, and no such storeys are to be occupied until the Council shall have issued a certificate that the provisions of this section have been complied with.

In the clauses dealing with chimneys and flues, section 64, clause 4, a flue is not to be adapted to or used for any new oven, furnace, cockle, steam boiler or close fire used for any purpose of trade or business or to or for the range or cooking apparatus of any hotel, tavern, or eating-house unless the flue be surrounded with brickwork at least 8½ inches thick from the floor on which such oven, furnace, cockle, steam boiler, or close fire is situate to the level of the ceiling of the room next above the same, and a flue is not to be used in connection with a steam boiler or hot-air engine unless the flue is at least 20 feet in height measured from the level of the floor on which such engine is placed. The floor under every oven, copper, steam boiler, or stove which is not heated by gas and the floor around the same is to be for a space of 18 inches formed of materials of an incombustible and non-conducting nature not less than 6 inches thick. The floor over any room or enclosed space in which a furnace is fixed and any floor within 18 inches from the crown of an oven is to be constructed of fire-resisting materials.

A most important provision as affecting the safety of shop assistants and the pockets of the shopkeeper is contained in section 74.

In every building exceeding 1,000 square feet in area, used in part for purposes of trade or manufacture and in part as a dwelling-house, the part used for the purposes of trade or manufacture is to be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials, and all passages, staircases, and other means of approach to the part used as a dwelling-house shall be constructed throughout of fire-resisting materials.

The part used for purposes of trade or manufacture shall (if extending to more than 250,000 cubic feet) be subject to the provisions of this Act relating to the cubical extent of buildings of the warehouse class.

It is, however, provided that there may be constructed in the walls of such staircases and passages such doorways as are necessary for communicating with the different parts of the building, and there may be formed in any walls of such building openings fitted with fire-resisting doors. It does not seem at all clear, however, if the openings from the business part into the domestic part are to be fitted with fire-resisting doors. To make the section of any use it should have been distinctly stated that the openings should be closed with iron doors, for if we refer to the schedule defining fire-resisting materials, we find that an oak or teak door two inches thick is considered fire-resisting.

Another important clause is:—In every building exceeding 2,500 square feet in area containing separate sets of chambers or offices or rooms tenanted by different persons, the floors and principal staircases shall be of fire resisting materials.

The limit of cubical space for buildings of the warehouse class has been increased from 216,000 cubic feet to 250,000 cubic feet, but there are certain exceptions to buildings situate at a greater distance than two miles from St. Paul's and used for certain specific purposes, constructed of brick, stone, or iron and of one floor only.

The Council, however, have power to consent to buildings up to 450,000 cubic feet, provided they do not exceed 60 feet high and are not used for the purpose of any trade or manufacture involving the use of any explosive or inflammable materials.

The rules as to openings to be provided in party walls separating large buildings are somewhat altered; the size is 7 feet by 8 feet as at present, but the number is limited to one-half the length of the wall. If, however, the distance between the iron doors in each side of the wall is not less than 24 inches the opening may be 9 feet 6 inches in height.

Respecting the safety from fire and panic in public buildings several provisions have been added which it is most important for the architect to note.

Every staircase for the use of the public shall be supported and enclosed by brick walls not less than 9 inches thick, and the treads of each flight of stairs shall be of uniform width.

No staircase, internal corridor, or passage-way for the use of the public shall be less than 4 feet 6 inches wide, except where the accommodation is for only 200 persons, and then the passage-way may be 3 feet 6 inches wide.

The width of the staircases, internal corridors, or passages is to be increased by 6 inches for every additional 100 persons above 400 until a maximum width of 9 feet is obtained, and a handrail is to be provided up the centre where the width is 6 feet and upwards.

You may, however, if you prefer it, substitute two staircase corridors or passages for one; then in that case they need be but two-thirds of the width of a single staircase, but in no case less than 3 feet 6 inches. You also want a separate set of staircases, corridors and passages to each gallery where you have more than one.

* A paper by Mr. Ellis Marsland, read before the Society of Architects.

All doors and barriers shall be made to open outwards and no outside locks or bolts are to be fixed thereto.

All staircases, corridors, passages and landings are to be constructed of and carried by supports of a fire-resisting material.

All public buildings have to be constructed in such a manner as may be approved by the district surveyor, or in the event of disagreement may be determined by the tribunal of appeal, and no public building is to be used as such until the district surveyor or tribunal of appeal shall have declared his or their approval of the construction thereof.

This I think exhausts all the new clauses under my second head. We now turn to the additional structural requirements.

The most important of these is the additional thickness required for walls. I have prepared a diagram showing in black the thickness of walls under the old Act, with the additional thickness shown in red required by the new. It will be observed that the height of walls of dwelling-houses jumps from 25 feet to 40 feet, and although you may have two storeys of 8½ inch work to a building 25 feet high, if it exceeds this height and you go to three storeys the lower two have to be 13 inches thick even if a part of the third storey is in the roof.

The thickness of walls is increased in most cases, and I think only in one case in warehouse walls are they reduced in thickness.

The new Act does not countenance hollow walls, for if they are constructed there is to be a wall on one side of the hollow space of the full thickness described by the Act.

The footings of walls are somewhat altered; they are to project on each side to half the thickness of the wall as at present, but their height is to be two-thirds the thickness, and where an external wall is built against another external or party-wall the footings on the one side may be omitted.

The underpinning of walls is to be done in cement, and where a wall is thickened this also is to be done in cement. The top six courses of all chimney-stacks are also to be built in cement.

There is an additional rule with regard to cross-walls. Wherever a cross-wall becomes in any part an external wall, such cross-wall shall be of the thickness required for an external wall of the same length and height.

Sections 65 and 73 will be welcomed by architects, as they will save them a considerable amount of time and delay in preparing their plans. Under the present Act, if we desire to erect a furnace chimney shaft, or project a bay window or oriel beyond the general line of frontage, an application was necessary to the Council; but under the new Act a furnace chimney shaft may be erected without this preliminary, provided that it tapers at the rate of 2½ inches in 10 feet, that the top 20 feet is 3½ inches thick, and that every additional 20 feet measured downwards increases in thickness half a brick; that the footings project to a distance equal to the thickness of the enclosing wall at its base and the space enclosed by the footings filled in solid; that the width of the base be at least 1-10th of the height if the shaft is square, and 1-12th if round or any other shape; that if there is a fire-brick lining it must be independent of the thickness of the shaft, and not bonded therewith; and lastly, that the concrete foundation and the cap be to the satisfaction of the district surveyor.

A bay window may now be projected beyond the general line of fronts in a street 40 feet wide, and on to the forecourt, if it does not exceed three storeys in height above the footway, and does not project more than 3 feet or exceed in width 3-5ths of the frontage. It also must not come within 20 feet of the centre of the roadway, or nearer to the party wall than its projection, and must not be used for trade purposes.

Oriel windows must not be less than 10 feet above the footway of the street, or project more than 3 feet from the building or 12 inches over the public way; their width must not exceed three-fifths of the frontage, and they must not come within 4 feet of the centre of the nearest party wall. The whole must be constructed to the satisfaction of the district surveyor, and if you disagree with him you may go to the superintending architect, whose determination shall be final.

It should also be noted that the eaves, barge-boards and cornices to dwelling-houses need not now be of fireproof material; nor is it necessary that the wooden cornices and barge boards to dormers, not exceeding 12 inches deep, be covered with incombustible material. You have still, however, to get the consent of the Council to any porch, portico, verandah, balustrade, outside landing, or staircase, if you desire to construct them of wood.

Frames of doors and windows may now come out to the face of an external wall—which will be good news to those who practise in the Queen Anne style. Shop-fronts, under Section 73, are not now confined to the ground storey, but may extend to the first floor, provided the total height does not exceed 25 feet. This will create quite a revolution in the appearance of our streets, although Section 55 seems to confine the frames of doors and windows of shops to the ground storey.

Bressummers, whether bearing upon a party or external wall,

must have an additional bearing of 4 inches upon a sufficient pier of brick or stone, or upon a timber or iron storey post, and the district surveyor is to have power in his discretion to require that every bressummer shall have such other storey posts, iron columns, stanchions, or piers of brick or stone or corbels, as may be sufficient to carry the superstructure.

There is to be a space left between the ends of iron girders to allow for expansion, such space to be equal to a quarter of an inch for every 10 feet of the length. Hearths may now be 6 inches thick instead of 7.

Just a word or two on Part VII., which deals with special and temporary buildings and wooden structures. These cannot be erected without the Council's consent, who may impose certain conditions as to their erection and limit the time which they may remain; but an open shed, whatever the definition of this may mean, can be erected, not exceeding 16 feet high and 400 feet in area of any substances and in any manner approved by the district surveyor. This seems to me a most extraordinary clause.

Part VIII., dealing with the rights of building and adjoining owners, contains in Section 87 some very useful provisions which will facilitate the operations of the architect in dealing with walls abutting on neighbouring lands.

Where lands of different owners adjoin and are unbuilt on at the line of junction, the following provisions shall have effect:—

If you desire to build a party wall on the line of junction, you may serve a notice thereof on your neighbour.

If he consent to the building of a party wall, the wall may be built half on the land of each of you, or in such other position as may be agreed.

The expense of building the wall is to be defrayed by you and your neighbour in due proportion, regard being had to the use made and which may be made of the wall by both of you.

If your neighbour does not consent to the building of a party wall, you may not build it otherwise than as an external wall placed wholly on your own land.

If, on the other hand, you do not want to build a party wall, but only an external wall up to the boundary of your land, you give notice to your neighbour, and one month after you may proceed with your wall and project your concrete and footings on to his land, making compensation to him for any damage you may occasion him, and if you cannot agree on the amount, this is to be determined in the manner provided in this section.

The only other points to which I wish to draw your attention in this part of the Act is that it provides that a building owner may underpin a party wall, a point uncertain in the old Act. Also he has a right to raise a party fence wall, or to pull the same down and rebuild it as a party wall.

The minimum limit of time in which a building owner may proceed to exercise his rights is reduced to one month in the case of a party fence wall and two months in the case of a party structure or party wall.

The building owner has now at his own expense, where he lays open any part of the adjoining land or building, to make and maintain for a proper time a proper hoarding and shoring or temporary construction for the protection and security of the adjoining owner.

If a building owner serve a party wall or structure notice on an adjoining owner, it is not available unless the work to which it relates is begun within six months after the service thereof and prosecuted with due diligence.

A fresh provision is contained in Section 93. It is incumbent on the building owner to serve a notice on the adjoining owner if he (the building owner) proposes to build within 10 feet of the adjoining owner's wall if such building will extend to a lower level than the foundations of the building adjoining, and if the adjoining owner so requires he is to underpin the wall, or if the building owner thinks it necessary he may underpin it, but he is to be liable to compensate the adjoining owner for any inconvenience, loss, or damage which may result by reason of the work.

If the building and adjoining owner disagree as to the necessity for underpinning, the matter is to be settled in the same manner as other differences under this part of the Act.

If after a building owner has rebuilt a wall and the adjoining owner subsequently wants to use any more of it than he previously enjoyed, he must pay for it.

In Part IX., relating to dangerous and neglected structures, a new provision affecting architects occurs.

After the district surveyor has certified a structure to be in a dangerous condition and the owner dispute the certificate, he may within seven days from the service of the notice inform the Council in writing that he requires the matter referred to arbitration; he may then engage his own surveyor to report on the condition of the structure in conjunction with the district surveyor, and if these two cannot agree they are to appoint an arbitrator or the court may appoint one for them, and such arbitrator is to make his award within fourteen days. If it is against the district surveyor, the Council pay the costs; if in

his support the owner has to pay the costs. In the meantime I suppose the dangerous structure may take care of itself or promptly fall down.

In Part XIV. the Council take power to make by-laws on the following additional matters:—The dimensions of wooden bressummers; the dimensions of joists of floors; the protection of ironwork used in the construction of buildings from the action of fire; woodwork in external walls; the regulation of lamp signs or other structures overhanging the public way not being within the City; the means of escape from fire in buildings exceeding 60 feet in height.

Before closing I must make reference to the tribunal of appeal. The number of its members consists of three, one to be appointed by the Secretary of State, one to be appointed by the R.I.B.A., and one to be appointed by the Surveyors' Institution, but no member or officer of the Council is to be on it (but ladies are not excluded), and they are to be appointed for a term of five years and to be paid. They also may appoint their own clerks, officers and servants, who shall be paid such salaries as may be determined by the Council.

Offices are to be provided, as well as such professional advice and assistance as they may find necessary.

These gentlemen will have a busy time, as the following will be some of their duties:—

To hear appeals as to—

What is considered the "level of the ground" on a building site.

Setting back and bringing forward buildings.

Accuracy of plans of old buildings.

Laying-out or widening of streets.

Superintending architects' decisions on lines of frontage, and which is the front and which is the rear of buildings.

Open spaces required in rear.

Height of buildings.

Construction of public buildings.

A point of archaeological interest to architects is contained in Section 191. In the event of the destruction or its being necessary to take down any portion of an old building of architectural or historical interest not in accordance with the rules, it may be restored by permission of the Council as originally constructed.

One word more as to the exemptions beyond those at present allowed, and they include:—

Buildings not exceeding in area 30 square feet and not exceeding 5 feet high, containing no heating arrangements and not beyond the frontage line.

Party fence walls under 7 feet high.

Greenhouses if not attached to other buildings.

Cases of metal and glass in window openings for plants not projecting over the public way or more than 12 inches from the external wall.

My task is now done. I have intentionally forbore any attempt at criticism, as the time for this ceased when the bill became an Act, and have contented myself with explaining its provisions.

It is for us now to loyally interpret it and carry it out to the best of our ability, and when we have become accustomed to its working the time may come when we may venture to point out any defects it may contain.

THE SANITATION OF HOSPITALS AND INFIRMARIES.*

(Concluded from last week.)

OUR next point is that insanitary conditions may be produced by inadequate or ill-conceived arrangements for the removal of refuse. It can scarcely be necessary, nor indeed would there be time for me to enter in any detail into the principles of drainage. The methods of sound drainage are the same in a hospital as in any other building; and the neglect of them leads in both cases to similar disaster.

In all sanitary fittings, including water-closets, sinks, lavatories and baths, simplicity of form and cleanly appearance are desirable. They should also be, as far as possible, self-cleansing, and all casings of every kind should be dispensed with. In operation theatres, where, above all things, minute and excessive cleanliness is of the last importance, it is well to make all shelves of glass, not only that the state of the underside as well as of the upper can be readily seen, but also because glass is perhaps the only material not liable to injury from the acids used in the theatre.

I have referred to kinds of refuse not liquid. I mean by that not only the household refuse, dust, ashes, kitchen-stuff and so forth, but ward refuse, such as bandages, dressings, poultices and the like. In a general hospital the ordinary

household refuse may be consigned to the care of the parish dustman; but it should be collected and stored in iron bins, for which a suitable shelter not near any ward should be provided, and it should be removed daily. Kitchen-stuff in a general hospital may also be separately stored and disposed of. But in a general hospital all the ward refuse, and in a fever hospital all refuse of every kind, should be burnt in a properly-constructed furnace. This furnace must be so constructed that the gases resulting from combustion are destroyed or decomposed before reaching the smoke-flue. Such an apparatus has been devised by Mr. Brophy, of the firm of Slater & Co., and is in use at the Middlesex and the London Fever Hospitals.

With regard to drainage generally, I will only add a word to impress upon you the extreme value of flushing. You can hardly have too much flushing power in hospital drains—or, for the matter of that, in any drains. If there is a laundry, the waste water can very well be taken to a flushing-tank, and utilised for flushing the drains by means of one of Mr. Roger Field's syphons. Of course, care must be taken to intercept the large quantity of shreds that invariably get detached from the clothes in the process of washing.

I now come to my last point, which was faulty arrangement of buildings. I have already indicated, when comparing the old and the new Lincoln Hospitals, the main features of mal-construction. What is called by Dr. Erichsen the "big-house system" is the sort of plan upon which so many of the larger provincial hospitals and some of the London hospitals were built, notably University College Hospital, where Dr. Erichsen's well-known lectures on Hospitalism were delivered. In extreme contrast to this we have such a building as the Eppendorf Hospital at Hamburg, where every ward is an absolutely isolated building, and not even a covered way exists on the site. The enormous cost, both for land, buildings and administration, of such a system could only be justified on grounds of absolute necessity. For myself, I fail to see the necessity; nor do I know of any sufficient reason for limiting the wards to one storey in height, as is done at many other recent foreign hospitals besides the Hamburg one. Provided you so construct your wards that each ward is cut off from direct air communication with the other wards and with the other parts of the hospital, provided that there is ample open space for all purposes of light and ventilation, it seems to me to be quite immaterial whether they are two or three storeys high. As an example of how wards should be isolated one from the other, I have here a plan of part of the new hospital now in course of erection at Derby. The wards are cut off from the corridor and from the staircase by short lobbies, which are, in fact, but covered bridges, with only just sufficient height for head-room, and with free air-space between the roof of one and the floor of that above. The corridor must of course be kept warmed at or about the same temperature as the wards; if this is done and ample inlets for air are provided in the latter, there will be no suction of air from corridor to ward. The ward itself must be as simple in construction and as cleanable in all its parts as it is possible to make it, and should contain nothing but the most necessary furniture. Suitable store-rooms must therefore be provided outside the ward for food, for linen and for patients' clothes, and an orderly closet for brooms, pails and other things necessary for daily use in the ward cleaning. Mouldings must find no place in a ward or in any of its offices; angles, whether vertical or horizontal, must wherever possible be hollowed—in vertical angles to promote circulation of air and avoid stagnant corners and in horizontal angles for facility of cleaning.

In the construction of ward floors I think solid or so-called fireproof construction is essential, and after much consideration and comparison of different kinds of floor surfaces I am inclined to think that carefully laid terrazzo is the best thing to be had. Hard-wood floors laid in block fashion are apt to tilt up with the weight of a bed plus a heavy patient, and the joints, however well made, will open in places. Terrazzo when well laid and when care is taken to have a sufficient thickness of concrete over the iron joists, gives a solid, homogeneous surface that is hard to beat. I know I shall be told that it is cold to the feet, but any slight inconvenience that may be felt from this cause can very easily be remedied.

A point of importance in regard to windows is that a window should always be put between the end bed and the end wall. This window may be as narrow as you like, but it must not be omitted. The necessity for this arises from the fact that these corner beds have been found to be less favourable to the well-being of patients than the other beds, owing, no doubt, to defective circulation of air round about the patient. The water-closets and sink-rooms must of course properly be cut off by cross-ventilated lobbies from the wards; this point is pretty generally recognised to-day. But what appears to be too often lost sight of is that, if it is necessary to take this precaution with regard to one closet, or set of closets, it is equally necessary to do it with every other. In a late competition for a large hospital I remarked several instances of the

* A paper by Mr. Keith D. Young, read at the meeting of the Architectural Association.

eglect of this obvious principle. In one case a two-bed ward ad its closet opening practically into the ward, and in another otherwise excellent plan the water-closets for the use of the nurses opened directly out of the ward corridor.

I fear I cannot give you any counsel of perfection for the finishing of wall surfaces in wards. The perfect wall-surface as yet to be invented; meantime, I doubt not if we can do better than a good Keene's cement surface painted and varnished.

If it is necessary to isolate wards from one another, it is of vastly more importance to separate the out-patient department, the operation-room, the laundry and the mortuary.

The out-patient department must be a separate building, and the only reason for any covered communication existing between it and the wards is, that the dispensary must be in touch with both. Or, to put it in another way, the dispensary must be part of the out-patient department, and to avoid having a second dispensary in the hospital proper, it must be also accessible to the nurses.

Equally necessary is it that the operation-room should be carefully isolated from all possible chance of air-borne contamination from any other part of the hospital. So far has this principle been carried abroad, that in one hospital in France the operation-room is a detached building in the garden and patients are conveyed to it through the open air in a specially-constructed litter. This is carrying asepticism to an extreme that we should probably find would not be upheld by any surgeon in this country. But I think it will be agreed that where possible the operation-room should be a one-storey building and cut off by a lobby from direct communication with the main corridor.

Inside the operation-theatre, everything that makes for perfect cleanliness and consequent asepticism must remain supreme. A floor of the best terrazzo, walls either of marble or enamelled tiles and well-painted and varnished cement ceiling, metal window-frames flush with the walls and hard wood doors, every part must be so made that the whole room can be if necessary swilled down with a hose. The fittings need careful consideration. For shelves the best material is glass, for reasons previously stated. Neither pipes or anything else must be fixed up against the walls so that they cannot be cleaned all round.

The laundry, again, must be an isolated building; it may be connected with the administration block by a covered way open at the sides, but even this I do not regard as an absolute necessity.

The mortuary building should be as far away from the rest of the hospital as possible. An essential part of the mortuary building is the post-mortem room, and here the aseptic precautions which in the operation-room are necessary for the sake of the patient are, to a lesser extent, perhaps, necessary for the sake of the medical officer. A post-mortem room should be as cleanable in all its parts as an operation-room, and the materials used in its construction, while less costly, should be of a hard, non-absorbent nature. For the walls glazed bricks, and for the floors cement or asphalt are most suitable, while the table itself should be of a hard marble, polished, and supported on a framework of iron. The floor should be drained by an open channel provided with an efficient flushing-tank, and covered with a movable iron grating.

In conclusion, let me try to summarise the essentials of hospital hygiene so far as the building is concerned. Perfect cleanliness in every part is the keynote, the beginning and the end of hospital construction, and to this every part must lend its aid. There must be no lurking-places for dust, no hidden recesses where foul things may be stored out of sight, no avoidable projections or ledges or mouldings to catch the dust, no cased-in pipes or shafts for foul linen, or lifts.

The patients must be safeguarded from infection from each other, from the out-patient department, the laundry and the mortuary, from the evil effects of ground air, foul drains or dust-bins. And in a word, every part of the establishment must be contrived with a view to facilitate that "exquisite perfection of cleanliness" which is the true secret of a healthy hospital.

Mr. ALEXANDER GRAHAM proposed a vote of thanks to Mr. Young for his paper. Referring to the subject of hospitals, he quoted a statement of Sir J. Cringle that he could effect a cure better in the old buildings than in the modernised hospitals of those days. The experience of the campaign in the Crimea had resulted in recommendations to regulate hospital construction by Sir Douglas Galton, Miss Nightingale and other authorities. Mr. Young had not made a distinction between town hospitals and country hospitals. In towns we were usually hampered for want of adequate space. In ventilating a hospital the difficulty was to give ventilation without causing draughts. A change of air could be easily provided thrice in an hour by ordinary means, though it would be difficult to lay down rule of thumb rules. It was better to work from the unit of floor space rather than that of cubic space. By cubic space you would have only 2 feet 6 inches between the beds, and he contended that floor space was more valuable than vertical space.

M. DE CHAUMONT said a height of 12 feet in the wards was sufficient. He (the speaker) considered a height of 14 feet was amply sufficient. He was pleased to hear Mr. Young condemn mechanical methods of ventilation, and pleased to hear him suggest that we should trust to natural ventilation by windows and open fireplaces. Mechanical methods so far he had never found desirable, and in addition they were expensive. For flooring, terrazzo might look more cold than it really was, but he preferred for flooring teak wood after undergoing the paraffin process. The suggestion to form shelves of glass was decidedly good. He had heard glass recommended for forming the walls of operating-rooms, but he had never seen the recommendation carried into practice.

Mr. GORDON SMITH seconded the vote of thanks. He endorsed the remarks of Mr. Young on ventilation of hospitals, and said he would rather depend on natural means in the shape of windows and fireplaces. In every hospital there should be an officer who should be responsible for the hygiene of the building, and architects would do well to have printed instructions on the use of the apparatus supplied under their direction. Floor space and distance between beds were factors that came before calculations of cubic space. A height of 13 feet for wards he thought was not objectionable when possible; in absence of patients wards should lay fallow, as was a custom abroad, and left to the open air.

Dr. PASTEUR said cleanliness in its absolutely chemical sense was necessary. If constructional materials were perfectly non-absorbent there would be no necessity to have wards lay fallow. He alluded to erysipelas, which prevailed in a hospital and ceased as soon as the cause of it was traced to a dustbin under a window letting in effluvia. Diphtheria ensued frequently from faulty drainage arrangements. He was inclined to condemn terrazzo flooring from hardness and not from its coldness. Accidents were more likely to occur with delirious patients, and he would recommend parquet flooring. In hospital construction the most important thing was attention to details. Artists who took the trouble to pay great attention to details had been most successful.

Mr. HENMAN alluded to the importance of giving the right aspect to wards. He did not favour the adoption of terrazzo floors. In change from cold to milder weather they dewed. It was a mistake to use glazed surfaces in wards, though they might be useful in w.c.s and operating rooms. Though they looked clean they were usually in fact damp and dirty, condensing just those products and exhalations that wanted to be got rid of. A hospital where the windows could not be opened, but ventilated it was supposed mechanically, was stuffy to a degree.

Mr. FARDEN, medical officer of the Middlesex Hospital, condemned terrazzo flooring. It fractured, possibly by contraction and expansion of the iron girders. He preferred solid teak floors.

A vote of thanks was passed to Mr. Young by acclamation and the proceedings terminated.

FIRE RISKS IN SYDNEY.

A SPECIAL meeting of the Institute of Architects of New South Wales, to which all architects and builders practising in Sydney were invited, was held some weeks ago, when a discussion took place on the question, "Is Sydney liable to be destroyed by fire?"

Mr. Thomas Rowe, who opened the discussion, said that Sydney had in the early days been laid out in a very crude manner, the main streets having formerly been bullock tracks. They had therefore exceptional difficulties to contend with, and they should profit by this experience in laying out country towns. The cities of Adelaide and Melbourne, as well as many of the more modern towns, were better provided against destruction by fire than Sydney was. They were all agreed as to the necessity of an amended Building Act to prevent the erection of defective buildings, such as they saw everywhere around them. All kinds of buildings were being put up in a defective manner, subject to fire. With regard to fire rates, he must say that they were unnecessarily high. He never could understand why the fire insurance offices of this city should increase their rates immediately after a large fire took place. He had always thought that the capital of a fire insurance company was so arranged as to provide for all risks, but it seemed that it was not so, for when a great fire took place in the city the rates were increased to cover the losses. There was something wrong somewhere. The forty-three insurance offices of the city at present covered risks to the extent of 61,185,715 $\frac{1}{2}$ l., an increase of 2,000,000 $\frac{1}{2}$ l. over the previous returns. Looking at the question from all points of view he could not say that Sydney was any different from other cities of the world regarding the liability to fire, and certainly in a no worse condition than London. He had travelled through cities on the Continent infinitely less provided against fire; and in Paris, for

instance, no provision was made in the building laws for the thickness of walls. In Vienna and other cities, however, the law was very strict in this respect. The President of the Institute had said that 90 per cent. of the bricks used here were unfit for building purposes, but his experience of forty years led him to the very opposite conclusion. With regard to the water supply, he might say that although the provision at present was excellent there was a danger in the case of a large fire continuing for more than ten hours of the high-level water supply becoming exhausted, and he certainly thought that a large reservoir of a capacity of 30,000,000 gallons should be constructed in the Centennial Park. The present high-level supply was 3,500,000 gallons. That the supply of water on low levels was adequate could be judged by the fact that the Prospect Reservoir had a capacity of 10,000,000,000 gallons. There was, however, a danger in case of two or three large fires occurring at the same time, and continuing for more than ten hours, of the high-level service being exhausted; and he considered the public had suffered a great loss by the adoption of the Prospect scheme instead of the Kenny's Hill scheme, which would have given an unlimited supply to the high levels of Sydney and suburbs. He thought that the public interest would be served by the appointment of a small board of works elected by the Government and the people to control water supply, sewerage and harbour and river works of the county of Cumberland, and to perform the duties of the present public works committee. The disastrous result of the recent fire at Lawler's was not due to construction, but was in his opinion due to the open spaces in the building, and an Act should be passed to prevent large open floor spaces. In conclusion, he quoted from the annual report of the Fire Brigades Board to show that the number of fires annually had decreased.

Mr. G. A. Mansfield said that there was not a city in the world which for its size and its age contained a larger proportion of good, sound, honest, building work than Sydney, and that to hold up to undeserved reproach our building contractors, our masons, carpenters, and bricklayers, was to libel in the most unjustifiable manner a large class of respectable honest men and worthy citizens. Indeed, the natural conditions which affected the supply of our building materials favoured good and substantial work. The chief dangers that beset Sydney come to us as a heritage from a former generation and constitute a risk for which no one now living could be held in any important degree responsible. They arose in a great measure from the manner in which the city was originally laid out, whereby difficulty was experienced in getting access to important centres to fight flames. The narrow lanes and *culs-de-sac* were fearful sources of danger to our plucky firemen, and as opportunity offered they should be done away with. Some limitation should be placed to the height to which a landowner should be permitted to run up a building, and some more stringent conditions imposed upon the construction of all buildings exceeding a given number of storeys.

Mr. Barlow (vice-president), Mr. Spain, Mr. Robertson, Mr. Davey (hon. secretary), Mr. McIntyre (of the Builders' and Contractors' Association), and Mr. Davidson also took part in the discussion.

The Chairman, in closing the meeting, said that Sydney was eminently liable to be destroyed by fire, and he could point to one spot in the centre of the city where, if a fire broke out, there was nothing in the world to prevent three-fourths of the entire block being destroyed.

Proposed Roman Catholic Cathedral for London.

SIR,—At the present time there is some talk about building a Roman Catholic cathedral in London. Since the destruction by fire of Old St. Paul's (originally belonging to the Roman Catholics) the Roman Catholics have not possessed a cathedral in this the largest city in the world. It is now proposed to erect a cathedral and the responsible authorities are asking for designs for a basilica or monastery. Allow me to point out that a basilica or monastery is not a cathedral. Any ecclesiastical architect ought to be aware of this fact. The difference between a basilica or monastery and a cathedral is as follows. At the end of the third century a basilica was a large hall used for the purposes of justice and commerce. After the conversion of Constantine the Great to Christianity, a considerable number of these halls passed into Christian hands and were used for Christian worship. The dark and dismal timber roof of a basilica has a depressing effect upon the worshipper instead of being light and soul elevating. A cathedral church in every diocese is that church in which the

bishop has his chair or seat. It is sometimes called simply domus, "the house" (duomo, Ital, Dom, Ger.), for as a "palace" sufficiently indicates the residence of a king, "so the Lord's house, which is the cathedral church, the palace of the King of kings, and the ordinary seat of the supreme pastor of a city and diocese, is sufficiently denoted by the single word domus." A contemporary of yours, writing upon the above subject matter, does not seem to know the difference between a basilica or monastery and a cathedral. What a cathedral church ought to be like we can judge by those of Italy, Spain, France and Germany, &c. What, for example, could be more soul inspiring to the worshipper than such an edifice as the Dom at Cologne? If the Roman Catholics of London wish to erect a cathedral worthy of its name they must not build a basilica or monastery, which is nothing but a copy of the old Roman hall of justice or commerce, and according to indisputable authorities no cathedral. Trusting you will favour me with space for this letter in your columns, I am, Sir, your obedient servant,

HENRY H. B. SANG,
Architect and Artist.

GENERAL.

H.E. Princess Edward of Saxe-Weimar has consented to open the annual sale and exhibition of work made by the members of "The Children's Salon," on December 20, 1894, at Westminster Town Hall, with a view to completing the endowment of a children's cot in the North-West London Hospital.

Mr. P. H. Rathbone read a paper at the last meeting of the Liverpool Architectural Society on "The Economic Value of Fine Architecture."

Dr. Christison, secretary of the Society of Antiquaries, has just opened the course of Rhind lectures in archæology in Edinburgh, his subject being "The Early Fortifications of Scotland."

The Art Gallery Committee of the Manchester Corporation have decided to purchase the collection of black and white drawings, 160 in number, executed by Mr. H. E. Tidmarsh for illustration of Mr. W. A. Shaw's recently published "Manchester, Old and New."

The "Céilidh," an old institution whereby Highlanders kept alive the traditions of their native hills and glens by meeting together in the evenings and recounting tales of interest and adventure, in a slightly modernised form has lately been revived by the High School Gaelic Class, under the presidency of Mr. Duncan Reid, F.S.L.A.

We Regret to announce the death of Mr. Septimus Oswald, architect, of Newcastle-on-Tyne, on the 26th ult., aged seventy-one years.

The Death is announced of Mr. A. B. Gibson, Newcastle-on-Tyne. Mr. Gibson, who was in his fortieth year, had practised as an architect in Newcastle for about twelve years, and designed several important works, and amongst them the Police and Fire Brigade Station in Westgate Road, several public baths and washhouses, the Walker Fever Hospital and St. Cuthbert's Church, Melbourne Street.

An Interesting Feature at the meeting of the Society of Architects on Tuesday next will be the exhibition of some rare and reference works in architecture. We understand that non-members of the Society desirous of inspecting these books and hearing Mr. Batsford's paper upon them and other works suitable for an architectural library, can obtain tickets of admission on application to the Secretary at the Offices of the Society, at St. James's Hall, Piccadilly, W.

An Inquiry was held in Chester on Wednesday before an officer of the Local Government Board respecting the application of the Town Council for permission to borrow 25,000*l.* for electric lighting.

An Injunction is to be applied for by the proprietors of the *South Wales Daily News* to restrain the contractors for the new Cardiff Post Office from proceeding, on account of interference with ancient lights.

The Spring Exhibition of the Manchester Academy will be held a month earlier than usual next year. The exhibition is obliged to close by the end of February, as the Corporation will require the building for the forthcoming Arts and Crafts Exhibition.

The German Emperor laid the last stone of the new Parliament House in Berlin on Wednesday.

The Collection of M. Garnier, the picture expert, who disappeared some time ago in circumstances that have never been cleared up, was sold in Paris on Tuesday. The sum realised was 27,069*l.* Millet's *Peasant Harrowing* was sold at 3,000*l.* his *Geese* at 1,520*l.*; Daubigny's *Landscape with Women Washing Clothes in a Brook* at 2,000*l.*; Corot's *Enfant Pêcheur* at 700*l.*; Diaz's *Forest Pool* at 600*l.*; a Troyon at 3,000*l.*

The Architect.

THE WEEK.

IN 1878 it was accepted without any doubt that the late Mr. HERBERT GRIBBLE, who was buried yesterday, was to be one of the fortunate architects of the century. He had just obtained the first place in the competition for the Oratory at Brompton, and on the recommendation of so competent a judge as Mr. WATERHOUSE, R.A. The conclusion was therefore warranted that Mr. GRIBBLE would not only possess a valuable commission but one that would bring him a select class of clients. At the time too he was a young man of thirty, whose powers were appreciated by men of his own age, who are generally the severest critics. He was also one of those architects who are obliged to sacrifice themselves to gain reputation for others, and if unknown to the world at the time of his success, he possessed experience as a designer. There was not much surprise among his friends when he gained the prize. As sometimes happens with important works, his great church did not, we believe, bring him the commissions that were anticipated. Before it was completed many things were introduced which diminished the architectural effect, and which must have given much pain to Mr. GRIBBLE. The completion of the exterior was also delayed, and that part is still in hand. But if the additions for which he was not responsible be abstracted, the building must be considered as among the most remarkable of our time. It has that Italian ecclesiastical character which was desired, although Mr. GRIBBLE's early experience was almost entirely confined to Gothic. Devonshire can justly include his name with her famous artists. He was born at Plymouth in 1847, and when he was sixteen he was articled to Mr. ALFRED NORMAN. Mr. GRIBBLE was about twenty when he came to London. He obtained an engagement in Mr. HANSOM's office and there remained for ten years. His spare time was spent in the South Kensington School, where he won the highest prizes of the department. He also made designs from time to time for other architects. His great natural abilities were strengthened by practice, and the success he attained was justly merited. If the opportunities were forthcoming he would have been equal to them.

GLASGOW does not exhibit many examples of old buildings. It is therefore wise on the part of the Corporation to preserve the Tron Steeple, although some of the citizens would be glad to see it removed as an obstruction. The special committee appointed to consider the subject have arranged that the ventilating opening which the Caledonian Railway Company are constructing to the east of the steeple, at the corner of Chisholm Street, will be screened by a façade of masonry which will harmonise with the architecture of the steeple. The plans of the buildings which the city improvement trustees intend to erect in Trongate, between the steeple and King Street, show that the frontage will be set back so as to line with the south wall of the Tron Steeple, leaving the western elevation, which is encroached on at present to the extent of 2 feet, entirely exposed. The architectural style of the street façade will be designed so as to harmonise in composition with the Tron Steeple, which is an example of late fifteenth-century work.

LOCAL boards must not imagine they are autocrats and are not obliged to give their reasons for refusing plans of new buildings which are submitted for approval. On November 12 Mr. GOULDING, a builder, lodged with the Swinton and Pendlebury Local Board plans and sections for forty-nine new houses or cottages which he proposed to erect on land which he had lately purchased. He sent with them a notice that on November 27 he intended to proceed with the buildings. On November 24 he received a letter from the clerk of the Board which stated:—"I am instructed to return to you the plans and sections for forty-nine cottages, and to inform you that they are not approved of by the Board." Mr. GOULDING thereupon resolved to apply for a mandamus. He made an affidavit that the plans were in accordance with the Public Health

Act, 1875, and the by-laws, and this was supported by the testimony of two skilled and experienced architects. Mr. GOULDING also declared that on several occasions he had asked the surveyor, the chairman and another member of the Board to give a reason for the rejection of the plans, but had always been met by a refusal; and that on one occasion the surveyor told him that his instructions were not to disclose the reason why the plans had been rejected. An application was accordingly made in the Queen's Bench Division on the builder's behalf by Mr. POLAND, Q.C. He argued that in such a case a Local Board had not an arbitrary power of rejection of building plans without any real ground or reason; they could only reject plans on some specific and intelligible ground. When they refused to state the grounds and reasons on which they had proceeded there was no remedy but an application to the court. A rule nisi for a mandamus was granted.

DURING the early part of this week the Palais de l'Industrie in the Champs Elysées appeared so animated that promenaders might be excused if they imagined that Time had grown oblivious, for the entrances to the Salon appeared as if April had come again. The fact was the time for sending in designs for the exhibition of 1900 had arrived. How many designs and drawings were received is not definitely stated. Six hundred and sixty copies of the instructions were issued, but they cannot all have inspired the possessors to try their fortune. The jury will consist of thirty-one members. Eleven will belong to the administration of the exhibition, ten will be nominated by the Minister of Commerce and ten will be elected by the competitors. The ministerial nominees are M. BARDOUX and M. BOURGEOIS, formerly Ministers of Public Instruction, the President of the Municipal Council of Paris, the Prefect of the Seine, the colonial delegate, the President of the Council of Roads and Bridges, the President of the Society of Civil Engineers, and the following architects, MM. BŒSWILWALD, DAUMET and CHARLES GARNIER. The members to represent the competitors are to be elected to-day. No competitor is to be among the jurors. As some of the designs will not be signed, precautions have been taken to insure that none of the authors can secure election. The author of every unsigned design must reveal his name confidentially to the commissary before he receives a voting paper, and any attempt to evade the rules will be followed by a declaration of ineligibility. The names of the architects who have signed their designs will be posted at the door of the Salon in which the election takes place. On the 20th inst. the designs will be exhibited. Eighteen will be selected, and premiums varying from 6,000 francs to 1,000 francs will be awarded to the authors. The administration reserve the right to make use of any or all of them, and if one of the designs is adopted the realisation of it can be confided, if thought necessary, to a different architect.

FROM its importance we must expect that the London Building Act which is about to come into operation will inspire several edited versions. We have received two. Mr. BANISTER FLETCHER'S (B. T. BATSFORD) has the advantage of introducing several diagrams, which for the lay mind are clearer than any verbal interpretation. He also gives the parts of the Metropolis Management Acts and others which were not repealed by the new Act. The by-laws that will be enforced are also introduced. An abstract of that part of the Act which directly relates to buildings has been prepared, and there is a comprehensive index. It is the law of building for London in one volume. Mr. FLETCHER treats the Act as the beginning of a new era. In the edition published by CROSBY LOCKWOOD & SON, and prepared by Mr. A. J. DAVID, B.A., LL.M., the differences between the old legislation and the new are pointed out in pithy notes. It is easy to repeal Acts, but the decisions of the Courts are of more enduring stuff, and Mr. DAVID refers to those which are likely to be applied in any litigation that may arise under the Act. The legal notes are invaluable, for by their aid the responsibilities of architects, builders and building owners are made clearer than by the unaided phraseology of the Act. Both editions have their use and both should be acquired.

SANCTA SOPHIA.*

IT is not often a book on an architectural subject appears in this country which is so captivating as the study of the Byzantine marvel which Messrs. LETHABY and SWAINSON have produced. From its history, associations and construction that building has almost a unique interest. There is no doubt it was long neglected by Western travellers as if it were valueless. Men like THACKERAY, who visited Constantinople in order to describe the things of note in the ancient capital, have come away without entering the building which surpasses all other creations to be found there. Architects would at the same period be no less indifferent. The Byzantine style was not appreciated because it was not understood. It was supposed to be a sort of mongrel combination in which the barbaric East was predominant. Now it is seen that, when the architecture is shown by an example like Sta Sophia, it sustains the severest of all tests—that of supplying a *raison d'être* for all the parts. Dedicated to the Spirit of Wisdom, the church may claim to be an inspired work. It is found, moreover, to be excellently adapted for its original use. Basilican, Gothic and Renaissance have become so identified with Western Christianity, it is natural to assume that one of them must be the ideal Christian style. Yet everyone who has carefully studied Sta Sophia must have misgivings about that conclusion. Among critics of architecture who would be competent to form a judgment on such a subject, probably two men could not be found whose principles were more at variance than JAMES FERGUSSON and THÉOPHILE GAUTIER. On that subject they agree. The former says:—"It remains even now an open question whether a Christian church exists anywhere, of any age, whose interior is so beautiful as that of this marvellous creation of old Byzantine art. . . . In fact, turn it as we will, and compare it as we may with any other buildings of its class, the verdict seems inevitable that Sta Sophia—internally, at least, for we may omit the consideration of the exterior, as unfinished—is the most perfect and most beautiful church which has yet been erected by any Christian people." The Frenchman is no less assured in his judgment. "Byzantine architecture," he writes, "is unquestionably the necessary style of Catholicism. Gothic architecture, whatever may be its religious value, does not so appropriately correspond with the creed. In spite of degradations of all sorts, Sta Sophia still surpasses all the Christian churches that I have seen, and they are many. There is nothing to equal the majesty of these domes, of these tribunes supported by columns of jasper, of porphyry, of verd-antique, with their bizarre Corinthian capitals in which animals, chimeras and crosses are interlaced with foliage. The grand art of Greece—it may be in a degenerated form—still impresses us in the temple, as if when CHRIST entered it, JUPITER had scarcely left it." Of late years no less unequivocal testimony to the worth of Sta Sophia has been borne by travellers from many lands.

Apart from its architectural greatness and its strange history, the church possesses an unique interest which, in a literary sense, may seem to be more important than the skill shown in arranging a wide base for the dome without making the precaution too prominent. Sta Sophia is the only building which has inspired a long poem. It is true a German critic describes that production as "byzantinischen Bombast," but as criticism upon the building itself has changed, we may conclude that the hexameters of PAUL the Silentiary will hereafter receive another sort of appreciation. Judging by his versicles, which are collected in the "Anthology," he must have been in request as a contributor to the albums of the fine ladies of Byzantium. But we doubt if HOMER or VIRGIL could have surpassed him in utilising the parts of a building for inspiration, and they could not show more reverence for art. PAUL appears to have witnessed the completion of Sta Sophia, as well as its reparation after the earthquake in A.D. 558, and his verses are invaluable because they express the vivid impressions which were produced when the church was perfect. The prose translation of the poem by itself is enough to give value to Messrs. LETHABY and SWAINSON'S book. The

variety of marbles employed in the church is suggested by the following passage:—

Who even in the measures of Homer shall sing the marble pastures gathered on the lofty walls and spreading pavement of the mighty church? These the iron with its metal tooth has gnawed—the fresh green from Carystus and many-coloured marble from the Phrygian range, in which a rosy blush mingles with white, or it shines bright with flowers of deep red and silver. There is a wealth of porphyry, too, powdered with bright stars that has once laden the river boat on the broad Nile. You would see an emerald green from Sparta, and the glittering marble with wavy veins which the tool has worked on the deep bosom of the Iassian hills, showing slanting streaks blood red and livid white. From the Lydian creek came the bright stone mingled with streaks of red. Stone, too, there is that the Libyan sun, warming with its golden light, has nurtured in the deep-bosomed clefts of the hills of the Moors, of crocus colouring glittering like gold; and the product of the Celtic crags, a wealth of crystals, like milk poured here and there on a flesh of glittering black. There is the precious onyx as if gold were shining through it; and the marble that the land of Atrax yields, not from some upland glen, but from the level plains; in parts fresh green as the sea or emerald stone, or again like blue cornflowers in grass, with here and there a drift of fallen snow—a sweet mingled contrast on the dark shining surface.

The great dome (which is about the same diameter as St. Paul's) it is well known is carried by semi-domes, which form the east and west ends of the nave, and by two arches 100 feet in span. The screen now within each arch is pierced with windows and would appear to be supported by two storeys of arcading. The poet gives the following description of that part of the church, which at the time was a more remarkable feat in construction than the Forth Bridge in our time:—

With dauntless pen I will describe what plan the Emperor devised for the broad church, and how, with builder's skill, both the curves of the arches and the vault of the wide extended house were formed with thin bricks and raised on firm foundations. Thus the skilful masterman, well versed in every craft, formed a ceiling to the lofty nave. Yet he did not send to the hills of Phœnician Lebanon, nor to search the dark woods of the Alpine crags, nor where some Assyrian or Celtic woodman goads on the oxen in dense forests, nor did he think to use fir or pine to roof the house. From neither the glades of Daphne by Orontes, nor from the wooded crags of Patara came cypress wood to form a covering for the mighty temple. For our noble king, since nature could produce no timber great enough, had it covered with stones laid in a round form. Thus on the four arches rose, like a beauteous helmet, the deep-bosomed, swelling roof; and it seems that the eye as it wanders round gazes on the circling heavens. And beneath the two great arches, to the east and to the west, you must know that it is all open and extended in the air. But towards the murmuring south wind and the cold dry north, a wall, mighty in strength, rises to the under side of the rounded arch. Now this wall is made bright with eight windows and rests below on great props of marble. For beneath it six columns, like the fresh green of the emerald, in union support untired the weight of walls. And these again are borne on strong columns fixed immovable on the ground; glittering jewels of Thessalian marble, with capitals above them like locks of golden hair. These separate the middle portion of the glorious nave from the neighbouring aisle that stretches alongside. Never were such columns, blooming with a many-hued brightness, hewn from the craggy hills of sea-washed Molossis.

As the church is (thanks to the conservative Turks) "one of the best preserved of ancient monuments," it is still easy after more than thirteen centuries to test the accuracy of the greater part of the poet's descriptions. But the sanctuary which was held in most reverence by the Christians was treated like the pictures and statues in English churches at the time of the Reformation. The iconostasis has disappeared. The secrecy which is one of the characteristics of the Greek as compared with the Western ritual was then omnipotent. There was an enclosure in which JUSTINIAN himself dare not enter. Although an outsider, the Emperor was lavish in beautifying it. The whiteness of silver made it the most fitting material for the iconostasis. PAUL tells us how JUSTINIAN "not only upon the walls which separate the holy priests from the crowd of singers has placed plates of silver, but has covered all the columns themselves with the silver metal, even six sets of twain, and the rays of light glitter far and wide. Upon them the tool has formed dazzling circles, beautifully wrought in skilled symmetry by the craftsman's hand. In parts stand up an army of winged angels in pairs, with bent necks and downcast mien." The ciborium was of silver arches resting on silver columns. The altar was still more precious, for says PAUL, "On columns of gold is raised the all gold slab of the holy table, standing on gold foundations and bright with the glitter of different stones." The Byzantines were famous for their textiles, and the curtains which were used to conceal the altar were wrought not only with

* *The Church of Sancta Sophia, Constantinople: a Study of Byzantine Building.* By W. R. Lethaby and Harold Swainson. (Macmillan & Co.)

figures of CHRIST, saints and angels, but with hospitals, churches and other tokens of works of mercy.

The poem also may help to remove one of the difficulties which cross the mind of those who study the famous building. What was the use of so great a dome? We cannot suppose that JUSTINIAN, with his architects, ANTHEMIUS and ISIDORUS, were only anxious to excel earlier efforts in construction. If they desired to have a dominating building in Byzantium, they would not have given so flat a contour to the dome. To gain effect for the mosque the Turks were compelled to erect four minarets. If we accept the words of PAUL the Silentiary, who describes the dome as bending over like the radiant heavens and embracing the church, it will then become symbolic. But the question arises, was any person more than another supposed to be embraced, or were the Emperor, the courtiers, the warriors and the people all alike in the position of miserable sinners before high Heaven? Now the poet tells us that under the dome was an ambo which in splendour rivalled the iconostasis. He uses his finest adjectives in describing it. The ostensible purpose of the ambo was to enable the priest to read the Gospel. The surviving Roman examples show that it was not considered necessary to ascend far above the people for that purpose. There were, no doubt, galleries in Sta Sophia which contained the superior people, but in the early days of Christianity they were not likely to be allowed extraordinary advantages. Was the ambo more closely associated with the emperors than is commonly supposed? At one time some of the ceremonies of a coronation were enacted on the ambo, and the structure may have represented the union of Church and State more clearly than is now supposed. In that case the importance given to the dome would be comprehensible.

For in Sta Sophia the dome is the key to the composition. We might suppose that ANTHEMIUS began with it. The predominance of curve lines is apparent at the first glance, and the sultans who presented the plaques with inscriptions from the Koran recognised that fact by making them circular. All the window openings have arched heads; the arcades are arched and many of the mosaics are set in circular borders. The capitals are not only of a more rational type than the Corinthian, but their contours are more emphatically curved.

A large part of the volume is occupied with a consideration of the methods that were likely to have been employed in the construction of the dome and of the other parts of the building. It is claimed that ANTHEMIUS was no mere administrator, who could work wonders by means of routine. "The master builders not only designed the church; they came 'and worked at every part,' and lived with their building until their death; they certainly graduated as workmen, and we hear nothing of their honours or position, only of their genius." In the words of M. CHOISY, "In JUSTINIAN'S time, to build was the essential rôle of the architect." The workman's individuality was also respected in Byzantium, for, says M. CHOISY, "The workman is no mere passive instrument, obedient, without any regard to initiative or responsibility; he is treated as an intelligent power and finds in front of him liberty, and a field open to his imagination." In whatever way they were organised the workmen employed at Sta Sophia were efficient. The site is not stable and has been subjected to earthquakes, but the building has survived many younger examples. Restorations were occasionally required and in 1847 much was done by FOSSATI, and since then by others, which is to be regretted. But, taken as a whole, the condition of the church after the wear and tear of thirteen centuries is a triumph of building.

It is not allowable to make such an examination of Sta Sophia as would be desirable in order to describe all the details of construction. Messrs. LETHABY and SWAINSON have so well supplemented their own observations by what is said by SALZENBERG and other writers, that their account of the "building procedure" appears to be ample. That part of the book will be a surprise to many readers, especially as it suggests the prevalence of a system of carrying out works which has not become obsolete in Turkey and the East. The following extract about the marble facing will suggest the care that was taken:—

At Sta Sophia the application of the thin sheathing and incrustations (the "crustæ" of Pliny) of the "delectable variety" of marbles

is made in many ways. First, there are the large sheets of the greyish Proconnesian, opened out side by side so that the veining of one follows from the next. Then the richer varieties are set in bands and panels, with narrow notched fillets between them, and still more precious slabs are framed round with carved margins of white. Over the doors entering the aisles at the west there are panels, with especially wide and rich borders of meanders growing from chalcises. The large panels are very often of two pieces, with matched veining. All the wall plating is arranged with delightful variety as to size, and in the alternate placing of light against dark, so that there is no rigidity or over accurate setting out. Besides this constant change of size, colour and arrangement, there is a great variety in the surface treatment. We have the shallow channelling into continuous mouldings of the skirtings, some portion of which has a stiff fret sunk in the surface in addition. Then there are panels on either side of the great door, and on the faces of the projections from the great piers in the aisles, coming just above the eye, of plain russet red or brown, which bear severe abstract patterns, made out by slight sinking into the surface. The centre in some cases is overlaid with an oval or square of another precious material, such as red or green porphyry or the onyx; the whole of the sunk portions may have been filled by inlays, or in some the sinking alone may have formed the design. The upper part of the bema is encrusted with slabs patterned in this way, and here the sunk portions are entirely inlaid. In this work "casements" are sunk into the rosso or other deep coloured field, and green porphyry and other materials, set off by yellowish white lines and spaces, are inlaid in geometrical panels or friezes of stiff foliage. . . . This uttermost splendour is quiet and soft in its result. The surface, of course, has not that mechanically even, repellently smooth, painfully fitted appearance of modern work. The planes are waved under the hand sawing, and the face is smooth but hardly polished. The colour, in consequence, grey and russet rising to full yellow, green and reds, veined, waved and flowered in all manner of gradations and lovely combinations, vibrates with a wonderful bloom, which doubtless owes much to age; but it is very probable that the marble was polished with wax encaustic, which was so generally used for finishing surfaces by ancient workers.

There are other parts of the book which, if space were at our disposal, we should like to notice, such as the chapters on the history of the church, the buildings that are attached to it (for as GAUTHIER says, "Toute la vie musulmane gravite autour de la maison de Dieu"), the restorations, &c. But all the pages of the book are so interesting it is difficult to make a selection among them, and the extracts we have given are only ordinary samples of the varied contents.

Lady MARY MONTAGU was courageous when she declared that "St. Paul's would cut a strange figure by Sta Sophia." As comparisons are inevitable when dealing with architecture, some critics will side with her ladyship; others will, like BYRON, "speak like a cockney" and stand up for the London cathedral. If it be asked which of the two affords the best lessons in art and construction, the verdict must be given in favour of the older building. But the teaching does not mean supplying an infinitude of details which can be applied indiscriminately. It is rather in inspiring such a belief as the authors of the book before us attained when they say:—

A conviction of the necessity for finding the root of architecture once again in sound common-sense building and pleasurable craftsmanship remains as the final result of our study of Sta Sophia, that marvellous work where, as has so well been said, there is no part where the principles of rational construction are not applied with "hardiesse" and "franchise." In estimating so highly the Byzantine method of building in its greatest example, we see that its forms and results directly depended on then present circumstances and then ordinary materials. It is evident that the style cannot be copied by our attempting to imitate Byzantine builders; only by being ourselves and free can our work be reasonable, and if reasonable, like theirs, universal. *L'Art c'est d'être absolument soi-même.*

ROYAL ACADEMY SCHOOLS.

ON Monday evening the prizes awarded to the successful students of the Royal Academy Schools were presented by Sir Frederic Leighton.

The President in a brief address said that he had to express commendation in respect of one particular class in the competitions, namely, the classic competition. The general feeling of the judges was that, irrespective of certain works which were of special merit, the whole of the work was of an extremely high and commendable character. In the set of six studies from the life the level was not such as they had been sometimes accustomed to, not such as they would see next year, not such as they would desire to have it in a branch which was vital to the efficiency of art. The class of decorative design for a public building was one to which they attached very high importance because of its immense potentialities for public use in this country. Several extremely careful and pretty designs had been sent in, he had almost said pictures, and they had

suggested to him one or two points to which he wished to draw their attention. The first was the absolute necessity of aiming at a broad and dignified and monumental simplicity, such as should characterise that class of work and distinguish it from other branches, such as easel painting. He also wished to point out the importance of bestowing as much care as they possibly could on the supplementary, the accompanying, study of a fragment of their design, because those designs were sent in in order that they might test the capacity of the student to carry out the work on a larger scale than in the design.

The prizes were as follows:—Landscape painting—a moorland—Creswick prize (30%), Percy William Gibbs. Painting of a figure from the life (open to male students only)—silver medal, 1st, Percy William Gibbs; silver medal, 2nd, Owen Baxter Morgan. Painting of a head from the life—silver medal, 1st, Edith Lydia Clink; silver medal, 2nd, Isabel C. Pyke-Nott. Painting of a draped figure (open to female students only)—silver medal, 1st, Emily Florence Watters; silver medal, 2nd, Katherine Mary Willis. Cartoon of a draped figure—a draped figure of the goddess Ceres—silver medal and prize (25%), Rose Livesay. Design in monochrome for a figure picture—Shadrach, Mesbach and Abed-nego in the fiery furnace (Daniel iii. 21)—Armitage prizes, 1st (30%) and bronze medal, Victor John Robertson; 2nd (10%), George Radolph Aylmer. Design for the decoration of a portion of a public building—a vintage—prize (40%), Hilda Koe. Set of six drawings of a figure from the life (open to male students only)—1st prize (50%) and silver medal, not awarded; 2nd (25%), Shirley Charles L. Slocombe, disqualified owing to having received the same prize before; 3rd (15%), Charles Augustus Büchel, disqualified owing to having received the same prize before; 4th (10%), Owen Baxter Morgan. Drawing of a head from the life—silver medal, 1st, Morris Bernstein; silver medal, 2nd, Gerard R. T. Leigh Hunt, disqualified owing to having received the same prize before. Drawing of a statue or group—silver medal, 1st, not awarded; silver medal, 2nd, Allan D. Davidson. Perspective drawing in outline (open to painters and sculptors only)—the small cloisters of Westminster Abbey—silver medal, no competition. Model of a design—the Fates—1st prize (30%), Francis Derwent Wood; 2nd (10%), Frederick Thomas. Set of three models of a figure from the life (open to male students only)—1st prize (50%) and silver medal, Henry Poole; 2nd (20%), William Willis. Model of a bust from the life (open to female students only)—silver medal, 1st, not awarded; silver medal, 2nd, Emily Florence Watters. Model of a design containing figure and ornament—grape gathering, the vine to be treated decoratively—silver medal, not awarded. Model of a statue or group—silver medal, 1st, Hibbert Charles Binney; silver medal, 2nd, Margaret C. T. G. Thurlow. Design in architecture—a public library in town—travelling studentship (60%), Percy Edward Newton. Set of architectural drawings—the banqueting-hall, now called the orangery, Kensington Gardens—silver medal, 1st, George Weald; silver medal, 2nd, Pieter Rodeck. Set of architectural designs (upper school)—prize (25%), Henry Seton Morris. Set of drawings of an architectural design (lower school)—prize (10%), Cecil Claude Brewer. Plan of a building—a Government school of art for a large manufacturing town—prize (10%), Ernest Tatham Richmond. Original composition in ornament—silver medal, no competition. Perspective drawing in outline open to architects only—Hanover Chapel, exterior—silver medal, George J. J. Lacy. The Landseer scholarships in painting and sculpture of 40% a year each, tenable for two years, have been awarded—in painting, to Shirley C. L. Slocombe and Percy William Gibbs; in sculpture, to Henry Poole and Robert Edward C. F. Glassby.

ARCHITECTURAL BOOKS.*

By HERBERT BATSFORD.

WHEN I received the honour of an invitation to read a paper before your Society on architectural books, I felt very diffident as to accepting it, for it occurred to me that the subject was one of which many of you might think you had already heard enough, and at the same time I realised the difficulty ahead in deciding from what standpoint I should take up the subject so as to impart fresh interest to it, if I accepted your secretary's invitation.

I therefore consulted him upon this point, and after some consideration we agreed that I should start upon some such—shall I say improbable?—hypothesis as that an architectural society desirous of forming a good reference library of architectural books had asked my advice as to which, assuming reasonable means, they should proceed to acquire. I propose to enumerate to you most of the books which in my opinion should be in such a library, and to make the briefest possible

comments upon some of them. At the suggestion of your secretary and in the hope that it may add to the interest of my remarks, we have displayed here some of those which I think are likely to be most interesting to you, although I regret it is impossible on this occasion to place before you all the books which I think worthy of your attention or to which I may refer.

Owing to the limited time at my command I shall be obliged to content myself with reading out the names of many without making any comment on them, and naturally some omissions from my list will occur to you, omissions which I must leave you to fill at your discretion. My object is to speak chiefly of those books which in my judgment are essential to the formation of a reference library upon architecture and the closely allied art of decoration.

Before proceeding further I am anxious to make a personal explanation. It would savour of egotism in me were I not to assure you that on this occasion I am representing also my father and brother, of whose wide knowledge and long experience I have had the full advantage.

I shall not attempt to wax eloquent in praise of architectural books, or to dilate upon the pleasure or advantage to be derived from their study, for that has already been well done by your late esteemed secretary, Mr. Middleton, and more recently by Professor Roger Smith, both of whose papers I had the pleasure of hearing. My remarks will be confined to an endeavour to point out the special character or interest of the work referred to. I must confess I was a little surprised when I saw an announcement that my paper would have some special reference to rare books. This, I think, arises from a little misconception on the part of your secretary. In truth there are not many rare architectural books, and for the most part they are, I think, useless in proportion to their rarity. They are luxuries to be acquired only by libraries far more extensive and costly than such as we are about to consider. The Royal Institute of British Architects somewhat recently acquired an *editio princeps* of Vitruvius, the rarest architectural book I know, and a possession to be coveted no doubt, but in our reference library Gwilt's or Wilkin's translation would find a more fitting place.

To come now to the subject of my paper. If I were asked to define in general terms what kind of books I thought essential to such a library as we are about to consider, I should reply, all such books as a student might reasonably be expected to consult in his architectural studies, or to which an architect might have occasion to refer in the course of his practice; and first amongst them one would naturally place such works as dictionaries, cyclopædias, general histories, journals and other serial publications pertaining to or illustrating the subject. Then I think there should be found one at least of the most authoritative and important works illustrating each of the various historic styles or periods of architecture in all countries, amongst which I would include important monographs upon some of the most remarkable edifices in the world. Next may be considered a class of works by no means so numerous as it might be, that devoted to public buildings and institutions, such as theatres, hospitals, markets and other municipal buildings, to which I would add some examples at least of the works of contemporary architects at home and abroad. Beyond these there remains the important subject of practical construction, sanitation, &c. There are, too, a few architectural biographies, and I would recommend any public library to acquire them all, for nothing I think could be more inspiring to a student than to read the memoirs of Pugin, Barry, Scott and the other great professors of their art. Milizia's "Lives of the Celebrated Architects" up to the end of the eighteenth century, translated by Mrs. Edward Cresy, should certainly be included amongst these.

I will now proceed to lay before you my list of books. First amongst the "special books of reference" I have placed that remarkable work the "Dictionary of Architecture," published by the Architectural Publication Society, and which was completed chiefly under the able and untiring editorship of the late Mr. Wyatt Papworth and the fostering care of Mr. Arthur Cates, who remained true to his post of honorary secretary from its inception to its completion.

Professor Roger Smith, in a recent lecture delivered at the University College, on "Discoveries in Architecture," spoke of it as a book bristling with sign-posts, calculated to "direct the student in his search of knowledge to the best sources of information." He said, also, that "in all the articles the most copious list of references occur," and that "it is of the greatest use to a student to have sources of information so liberally spread before his view." After this I need only add that the book contains 2,300 folio pages of text and some 250 plates, besides other illustrations in the text.

I am sure the next book you expect me to mention is Gwilt's "Encyclopædia of Architecture," and the mere mention of it will be sufficient. With Gwilt's "Encyclopædia" I am disposed to bracket Parker's "Glossary of Terms used (particularly) in Gothic Architecture," three volumes, 8vo, the illustrations of which are delightfully drawn and engraved.

* A paper read before the Society of Architects on Tuesday, December 11, the president, Mr. E. J. Hamilton, in the chair.

There are two exceedingly good dictionaries which are not, I think, so well known in this country as they deserve to be; they are Bosc's "Dictionnaire Raisonné d'Architecture," four volumes, with 4,000 illustrations, and Chabat's "Dictionnaire des Termes employés dans la Construction," the most comprehensive dictionary of terms used in construction extant. Amongst "reference books" I should also include the following:—D'Agincourt's well-known "History of Art by its Monuments," which has over 3,000 small illustrations, and the English edition of which was edited by Owen Jones; Fergusson's "History of Architecture," now in five volumes, which needs no comment of mine; Gailhabaud's "Monuments Anciens et Modernes," a work which illustrates on 400 steel plates a large number of the principal buildings of all ages in a clear and correct manner. I almost hesitate to include in this class Viollet-le-Duc's celebrated books, "Dictionnaire de l'Architecture Française du X. au XIV. Siècle," "Dictionnaire du Mobilier Français," for although they are entitled "Dictionnaires," they are really something more, and the same may be said of Havard's "Dictionnaire de l'Ameublement et de la Décoration." Of these I shall have something further to say later on.

Some of the finest works ever produced have been devoted to ancient art in Egypt and Western Asia, notably that of Champollion, "Monuments de l'Égypte et de la Nubie," four volumes, folio; that known as "Napoleon's Egypt," being the result of an expedition sent out by him (Napoleon I.), twenty-one volumes, folio; and that of Von Lepsius, in twelve volumes, the result of a similar expedition, aided by the King of Prussia; but the latest important work upon Egypt is that of Prisse d'Avennes, which is confined to architecture and the auxiliary arts, and if either of these large works be necessary in our library, I should give preference to it, although I believe Egyptologists prefer one or other of the older works. I must just mention here the valuable work, "Monuments of Nineveh," by the late Sir Austen H. Layard, published in 1849-53, and the more recent French work, "Monuments de Ninive et l'Assyrie," by Victor Place, 3 volumes, folio; and the Comte de Vogue's work in two volumes, entitled "L'Architecture dans la Syrie Centrale." I am, however, disposed to think that the handy series of volumes produced by those zealous Frenchmen, MM. Perrot and Chipiez, would be as much upon this early period as is required. It is a cause for satisfaction that they have been translated. The English editions are on the table. They deal with the history of art in Phœnicia, Cyprus and Asia Minor; Ancient Egypt; Chaldaea and Assyria; Sardinia and Judæa; Persia; Phrygia; and Primitive Greece.

Indian architecture unhappily has not been illustrated in a manner worthy of the subject. When we look at the grand books published in France on Eastern art, we can form some idea of the elaborate works which would have been produced had India been a French instead of a British possession. It is true volumes illustrating special surveys have been published, but for an historical view of the subject we must consult Mr. Fergusson's volume dealing with Indian and Eastern work, and a very interesting volume recently published in France by Monsieur Le Bon, entitled "Monuments de l'Inde," and I should mention a very useful series of six portfolios of architectural details, drawn by natives under the direction of Colonel Jacobs, which was published in 1890.

Turning now to Grecian architecture, the first book which it occurs to me to mention is that splendid monument of patient research, Stuart and Revett's "Antiquities of Athens." The first volume was published in 1762 and the fourth in 1816, and in 1830 a volume which can form a supplement to "Stuart and Revett" was issued, illustrating further antiquities in Greece, the result of a visit there by T. L. Donaldson and Professor Cockerell. Let us pause for a moment to compare the manner of production of say the first plate of Stuart's book with that of the plate of St. Paul's Cathedral before us. In the first case the drawing has been made, at what expenditure of ability and patience I may well leave you to judge, then the engraving on copper, by an artist of repute, at considerable cost, and taking weeks perhaps months to finish; in the other case a photograph has been taken, not of course without difficulty, but the actual process occupying but a few seconds of time, and the reproduction known as "collotype" is made in a few hours at a fractional cost of the old engraving. But at the time of which we are speaking it was the fashion to patronise antiquarian and architectural publications, and if you look at the list of subscribers to be found, almost invariably, at the commencement of the books of the period, you will find that a large number of the nobility and members of county families were subscribers for them, although probably few of these subscribers took much heed of them afterwards.

Stuart's "Athens" was quickly followed by the publication of the first volume of the "Ionian Antiquities," issued by the Dilettanti Society, and it is curious to note that although the Society announce themselves as "some gentlemen who had travelled in Italy," the only books they published illustrate

Greek art. They include the "Antiquities of Ionia," four volumes, volume four issued so late as 1881; "Unedited Antiquities of Attica;" "Specimens of Ancient Sculpture," two volumes; Penrose's "Principles of Athenian Architecture." All these volumes are beautifully engraved, and a second edition of Mr. Penrose's work was issued in 1888. It is, however, to be regretted that in their desire to encourage the study of Greek art they did not see their way to issue this work at a price within the reach of many, instead of a very limited few. Other books which I regard as necessary are Cockerell's "Temples at Aegina and Bassae," Wilkin's "Antiquities of Magna Graecia," and Inwood's "Erechtheion at Athens." Considering the importance of Greek art and the attention now being bestowed upon it, I should advise the acquisition of all these works, but beyond "Stuart and Revett" Penrose is at least an "essential."

Turning now to Roman architecture, I will first mention the works of that marvellous artist Piranesi, who in some twenty-five years published more than thirty folio volumes, containing upwards of 2,500 engravings, illustrating the architectural antiquities of Rome. The force and vigour which he gave to his work have caused him to be known as the "Rembrandt of Architecture." With mingled feelings I would add, on the authority of Bryan's "Dictionary of Painters and Engravers," that he on two occasions attempted to practise as an architect, but apparently clients were not forthcoming. Some examples of his engravings are on the table. Although I do not propose to overweight our "library" with any considerable number of his plates, some at least are worthy of a place, both for the subjects they illustrate, and the unique quality of the drawing. On ancient Rome the most thoroughly architectural, I was about saying "practical," work is Taylor and Cressy's "Architectural Antiquities of Rome," a worthy companion to Stuart's "Antiquities of Athens," with plates almost equal in beauty (two volumes), published in 1831. Cameron's "Baths of the Romans" is valuable, as giving illustrations of the Baths of Titus, the ceilings of which inspired Raphael in designing the arabesques of the Loggia at the Vatican. A very valuable work on Roman construction is M. Choisy's "L'Art de Bâtir chez les Romains." The folios by Robert Wood on the "Ruins of Palmyra and Baalbec," and Robert Adam's folio on the "Palace of the Emperor Diocletian at Spalatro," all published about the middle of last century, should certainly be added to the library, as they worthily illustrate the remains existing at that time of these examples of Roman splendour, which undoubtedly greatly influenced the Brothers Adam in the design of their many works, most of which are to be found within a mile or so of this hall.

On Pompeian architecture and art, the most complete work is the very beautiful and elaborate one by Niccolini, still in course of publication, although upwards of eighty parts are already issued. This is far too extensive and costly a work to be included in a moderate library; and for architecture, Mazois's "Les Ruines de Pompéi," four volumes, folio, published between 1812 and 1838, or Gell and Gandy's "Pompeiana," a copy of which you will find in the room, four volumes, published between 1817 and 1837, or the two folio volumes of drawings, beautifully engraved by W. B. Cooke, with descriptions by Professor Donaldson, published in 1827, may well be substituted. For illustrations of the wonderful painted walls of Pompeii, I place above all Cavalier d'Amelio's magnificent series of plates, entitled "Pompei Dipinti Murali Scelti," recently issued. Of this a copy is on the table. On the authority of the Cavalier himself, I may assure you that the brilliant colours of these plates are absolutely faithful to the originals when first excavated, and before the action of the atmosphere affects them, which it does very rapidly after their long burial.

The following books illustrating the Orders and architectural ornaments, both Grecian and Roman, must not be omitted. Normand's "Parallèle des Ordres de l'Architecture," an English edition of which it is interesting to note was edited by the elder Pugin and published in 1829. Mauch's "Architektonische Ordnungen," which has been reissued with a supplement as late as 1875, Sir William Chambers's celebrated "Treatise on the Decorative Part of Civil Architecture," Tatham's "Etchings of Architectural Ornament," Vulliamy's "Examples of Ornamental Sculpture in Architecture," and Mr. Spiers's "Orders of Architecture," which is chiefly a selection of plates from Normand and Mauch.

I feel obliged to make a somewhat general grouping of works on Byzantine, Early Christian, Romanesque, Saracenic and Mohammedan architecture. Taking the first of these the authorities are Texier and Pullan's "Byzantine Architecture," Salzenberg's elaborate monograph on Sta Sophia at Constantinople, and that very correct and valuable work, "L'Architecture Chrétienne," by Hubsch; this is a careful parallel of the early Byzantine churches and basilicas. The author is a German, and the book was first published in Germany, but a French edition was also published under the title I have given. Another very valuable work on this period of art is "L'Art de Bâtir

chez les Byzantins," by M. Choisy, a companion to his work on Roman building, which I have already mentioned in terms of commendation. But above all works on this period of art comes that remarkable monograph, completed only within the last few months, although commenced nearly twenty years ago, on St. Mark's, at Venice. The publisher, Signor Ongania, in his enthusiasm for the splendid monument under the shadow of which he spends his days, has issued this most exhaustive work almost regardless of expense, and, I fear, without commercial benefit. We have here the volume of coloured plates, part of which forms a view of the front upon such a scale as I think no other building has ever been illustrated. These plates and the two portfolios of details, which are also here, will give you some idea of the magnificent manner in which the book has been produced. Surely a publication so worthily illustrating the grandest building of the world should find its way into every public architectural library, although I believe I am correct in saying that it is not to be found in any such library in England. I know it is in some public libraries, notably Liverpool, which can boast of one of the richest collections of architectural books in the country.

Then there are Darstein's work, one of great research, entitled "Etude sur l'architecture Lombarde;" Mr. T. G. Jackson's work in three volumes, 8vo, published in 1887, the result of visits to the Dalmatian district; and the fine book by Revoil, three volumes, folio, entitled "Architecture Romane du Midi de la France." This has mainly been the source of inspiration for the style introduced into America by the late Henry Hobson Richardson, and since imitated by so many of his followers with a sad lack of his original and vigorous treatment. For Saracenic work I need only mention that of Gally Knight, entitled "Saracenic and Norman Remains in Sicily," and a recent work published in America, called "Norman Monuments of Palermo and Environs."

Arabian art has been splendidly illustrated in Prisse d'Avenne's magnificent work, "L'Art Arabe," in three volumes, folio, with a quarto volume of text—a work which displays in its beautiful plates remarkable examples of architecture and the subsidiary arts from the twelfth to the eighteenth century. Another beautiful work which is full of detail of Arabian work is that of M. Jules Bourgoïn, entitled "Les Arts Arabes."

It is some source of satisfaction that the great monument of Moorish art, the Alhambra Palace, at Granada, published in two grand volumes in 1842, and which is one of the grandest books illustrating one building ever published in this country, is mostly the work of an eminent Englishman, the well-known Owen Jones, who with M. Gourey went and stayed six months in the Alhambra during 1834, preparing some of the drawings for this work, and on the death of M. Gourey through cholera caught there returned home, but revisited the Alhambra in 1837, finishing the drawings for the remarkable monograph, a copy of which is here. You will, I am sure, feel that this book has special claims on your attention.

(To be concluded.)

The vote of thanks was proposed by Mr. E. J. Kibblewhite, seconded by Mr. G. A. T. Middleton, A.R.I.B.A., and supported by Mr. William Woodward, A.R.I.B.A., Mr. Quinn, librarian of Chelsea Public Library, and others.

GLASGOW ARCHITECTURAL ASSOCIATION.

At the meeting of this Association, the president, Mr. A. N. Paterson, in the chair, Mr. Charles J. Davidson read a paper on "The Planning of Farmhouses." Dividing the subject into three classes—sheep farms, dairy farms and stock-rearing farms—the different requirements of each were explained in great detail. The buildings connected with sheep farms are few and consist usually of a house for the farmer, with small barn, wool-house and poultry-house. Dairy farms for the keeping and rearing of cows are more elaborate. The byre is the largest of the buildings, and along with the dairy and scullery forms the principal feature of the steading. In a stock-rearing farm the principal object is to provide for the accommodation and rearing of large numbers of cattle. The arable land of such farms is cropped mainly for the purposes of fodder and bedding. In referring to the domestic arrangements it was remarked that in no department of farm planning is reform more urgently required than in the sleeping apartments appropriated to farm servants, which are in a large number of cases such as merit extreme reprobation, and are disgraceful to the farmers and their landlords. In the disposition and grouping of the various buildings, the leading object to be arrived at in the arrangement of the plan is economy of time and labour in the performance of the work to be carried on. To this end the two main principles to be observed are:—(1) That there should be an immediate connection between those buildings and apartments whose usefulness depends upon each other; and (2) that houses used for analogous purposes should, as far as possible, be classified and arranged together. Treating of the

architectural appearances of farmhouses, Mr. Davidson said that in some cases the whole steading can be arranged symmetrically; and where this is not attainable, the extended lines of buildings, the varying outline caused by the different heights and the numerous gables seldom fail to give a certain degree of piquancy and picturesqueness. The paper was illustrated throughout by reference to a number of plans and diagrams hung upon the walls.

LIVERPOOL ARCHITECTURAL SOCIETY.

As mentioned in *The Architect* last week, Mr. P. H. Rathbone read a paper on "The Economic Value of Fine Architecture." He remarked that the necessities of life being now supplied by a fraction of the population, the question was how were we to provide employment for the remainder so as to enable them to remunerate the providers of the necessities. The wealth of a country really consisted in the possession of the means to use the higher intellectual powers and to supply the needs created by them. One city became wealthier than another by accident. The permanence of its prosperity depended on the use it made of the wealth it accumulated. They could not get a sense of citizenship by any amount of mean, ignoble streets; but by erecting noble public buildings remarkable not only for their size, but also for that beauty of decoration which formulated the nobler and finer feelings of citizens not unworthy of the highest and most developed form of humanity. That was as true in regard to architecture as to other forms of art and literature. The future greatness of cities would be in proportion to the skill of their artisans. The future of Liverpool as a city containing a large and intelligent body of men fitted to be the leaders of civilisation depended upon their success in educating and employing a large body of artisans, and giving to them monuments and buildings which would create a society to which the best of all schools would be proud to belong. They trusted that the new school of architecture and applied arts in Liverpool would receive the support of the municipality and the public. Some Liverpool improvements that would not last fifty years had cost half a million sterling, and half a million judiciously employed might construct a building celebrated throughout the world. Owing to the telephone and telegraph, people could transact business at a distance, and the great master minds would settle themselves where there was the greatest intellectual life and enjoyment, leaving the hewers of wood and drawers of water to occupy the back yards of civilisation. Architecture was almost the only means of affording a visible impression of the greatness and intellectual superiority of a city. Its rapid strides in fine buildings had placed London among the capitals of Europe; but during the last fifty years Liverpool had not built a single building which could be reckoned among the chief buildings of the Continent. There was no want of wealth, and they had men quite capable of designing, and a population which, if instructed, might become the finest body of artisans in the world.

TESSERÆ.

Cimon's Influence in Athens.

CIMON was the friend of every genius and every art; and, the link between the lavish ostentation of Themistocles and the intellectual grace of Pericles, he conducted as it were the insensible transition from the age of warlike glory to that of civil pre-eminence. He may be said to have greatly contributed to diffuse that atmosphere of poetry and of pleasure which even the meanest of the free Athenians afterwards delighted to breathe. He led the citizens more and more from the recesses of private life, and carried out that social policy commenced by Pisistratus, according to which all individual habits became merged into one animated, complex and excited public. Thus, himself gay and convivial, addicted to company, wine and women, he encouraged shows and spectacles, and invested them with new magnificence; he embellished the city with public buildings, and was the first to erect at Athens those long colonnades beneath the shade of which, sheltered from the western suns, that graceful people were accustomed to assemble and converse. The Agora, that universal home of the citizens, was planted by him with the oriental planes; and the groves of Academe, the immortal haunt of Plato, were his work. That celebrated garden, associated with the grateful and bright remembrances of all which poetry can lend to wisdom, was, before the time of Cimon, a waste and uncultivated spot. It was his hand that intersected it with walks and alleys, and that poured through its green retreats the ornamental waters, so refreshing in those climes, and not common in the dry Attic soil, which now meandered in living streams and now sparkled into fountains. Besides these works to embellish, he formed others to fortify the city. He completed the citadel, hitherto unguarded on the south side; and it was from the barbarian spoils deposited in the treasury that the expenses of founding the long walls, afterwards completed, were defrayed.

The Destruction of Pompeii.

It is commonly but erroneously supposed that the town was overwhelmed by lava ejected from the crater of the volcano. Such lava streams, like broad watercourses of black rock, may be traced down the sides of Vesuvius; some may be of the date of the great eruption which destroyed the town, but it is certain that none of them reached the town itself. Pompeii owed its destruction to two causes. Ashes and small pumice stones, like white cinders, were thrown out of the crater and fell in dense showers over the surrounding country. They were probably carried to a considerable distance by the wind, but the greater part seems to have fallen on the coast between the foot of the mountain and the sea on which Herculaneum, Pompeii and Stabiae stood. The Italians call these pumice stones "rapillo," or "lapillo;" in the earlier records the former word is used. In addition to the "lapillo," torrents of mud, formed by ashes, lava and other volcanic matter, mingled with water abundantly ejected from the crater, rolled down the mountain side, and spreading in broad streams as they reached the lower country, completely covered everything within their reach. This thick mud, called by the Italians "lava bavosa," accumulated wherever it was checked, and penetrating into every nook and cranny, soon hardened and encased every object with which it was brought into contact. In its hard state it is called "tuono." In uncovering the ruins, the mode in which they were buried is distinctly traceable. The small loose pumice stones, or "lapillo," and the hardened mud are found in well-defined strata or layers, sometimes running one into the other, like what geologists call "faults." The "lapillo" usually forms the lowest stratum, covering the pavement of the streets and the floors of the lower rooms to the depth of many feet, thus proving that the town was first overwhelmed by the showers of pumice stones. The cellars and places into which the "lapillo" could not penetrate are filled with the hardened mud which succeeded to the pumice stones, and above which it lies in distinct layers. It cannot be ascertained precisely how deep the town was buried by the eruption of A.D. 79. Some of the strata of volcanic substances above the ruins came from subsequent eruptions. The height of the various strata from the level of the plain upon which the town was built to the present surface appears to vary between 20 and 40 feet. Sir William Gell thus describes a section of the strata near the amphitheatre to the height of 20 feet:—"Separating the whole into five portions, we shall find the first three to consist of pumice stone in small pieces, resembling a light white cinder, and covering the pavement to the depth of 12 feet; the next portion is composed of six parts, beginning with a stratum of small black stones, not more than 3 inches in thickness; to this succeeds a layer of mud or earth, which has been mixed with water and appears to have been deposited in a liquid state; upon this lies another thin stratum of little stones of a mixed hue, in which blue predominates; a second stratum of mud separated from a third by a thin wavy line of mixed blue stones, completes the fourth portion; while the fifth or highest division consists entirely of vegetable earth, principally formed by the gradual decomposition of the volcanic matter."

The Pelasgians in Greece.

One honest tradition, admitted even into the pages of Plato, contradicts the poetical theory of aboriginal savage life and attests the existence of a primitive Greek civilisation. The Pelasgians of Greece, like the earliest inhabitants of many other lands, accommodated themselves to the varying features of the country. According to that patriarchal division of pursuits, dictated and maintained by the very aspect of the earth we dwell on, some were "keepers of sheep" and some were "tillers of the ground." They had the eye of the grazier for healthful pastures. They had the instinct of the farmer for rich plains. They had the political tact, as in the case of the settlers in Attica, sometimes to prefer those situations wherein local defects held forth a promise of unmolested possession to regions of greater fertility, but therefore of greater insecurity; the "dinner of herbs" with peace to the "stalled ox" with danger. Their polygonal architecture was ingenious in its characteristic device, and has chronicled its own tale in traces that are still legible. They practised the art of navigation. They founded ancient thrones, and here and there, if probable inferences may be drawn from words of Aristotle's, struck out the rudiments of the representative system. Their language, involving in its structure the chief germs of the Hellenic and Latin tongues, exhibited those beautiful principles taught by the philosophy of nature, from which the best forms of modern speech have more or less degenerated. The charms of song were not unknown to them, nor unknown were either the mystic rites of the oracular shrine or the cheerful ceremonies of the religious festival. Strangers, it is true, at last are seen to mix with the Pelasgic population, but their figures must be kept to the background of the stage. Even on the Athenian faith and works of art are stamped some traits of the Egyptian physiognomy. But slight, demonstrably slight, as was the

impression made by foreigners on the Greek vocabulary, it was no deeper on the Greek manners. They might plant the olive on the soil of Attica, but assuredly they did not imitate her previous inhabitants in agriculture; they might extend the catalogue of gods and goddesses, but they did not teach the morality of marriage or the worship of a deity.

Geology of the Roman Catacombs.

The catacombs, vast as they were, and found in greater or less numbers, in greater extent and depth, on almost every side of Rome, were directed, limited, necessarily self-adapted to the conformation of the land and to the geological strata, some of which received them with welcome and security, others inhospitably repelled them, being altogether unfit for such use. Without going deep into the geological formation of the basin of the Tiber, in which lies Rome with her seven hills, and amid the adjacent valleys and heights, there are mainly three kinds of deposit left by the successive changes in the geology of the region. These are the *tufa litoide*, the *tufa granulare* and the *tufa friabile*. From the first of these came probably much of the stone used when Augustus transformed the city of brick to what his flatterers called a city of marble; from the latter the pozzuolana and the sand used for building and for other ordinary industrial purposes. Of these the first was too hard; it would have been enormously costly to hew it out into the spacious and intricate necropolis, which must be perpetually enlarging its dimensions to receive the remains of the growing and multiplying Christian population. The latter was far too loose and crumbling for the purpose of secure and lasting burial. But the second, the *tufa granulare*, formed chiefly of volcanic deposits, was not too hard to be worked, yet was solid enough to make walls for long and intricate passages or ambulacra, to be hewn into arches, vaulting over deep recesses in which the coffins were arranged, and to support floor below floor—two, three, four, five—down to the utmost depth at which the formation was found. But, of course, when these formations so suited for them ceased the catacomb stopped; the passage died away (this is De Rossi's expression) against the hard rock or as it approached the crumbling pozzuolana. The catacomb must also maintain itself at a certain height. If it descended towards the valley of the Tiber, the course of the Anio, or even of smaller streams like the Almone, it would be liable to be flooded, or at least suffer from the filtration of water, dangerous, if not to its security, yet to its decent propriety. In parts it might expand into a more spacious area, where, we know not how early, might be the lowly chapel, and in times of persecution the place of refuge from cruel death.

Prehistoric Dwellings in Scotland.

It is curious to think that, during the deposition of the prehistoric formations, Scotland was a forest, and that where now is mile after mile of moss and blackness there flourished oaks, and that among these lived numerous wolves, wild boars and savage bulls. To secure himself from these enemies, even if he had none such in his brother man, the aboriginal Caledonian required a dwelling, and even in the Stone period he contrived to have some such protection. The dwellings of the men of this state were like those of the badgers, and indeed like those of certain natives of Siberia at this day—underground. Dr. Wilson has collected curious instances of such. They are, he tells us, almost uniformly found in groups—a striking instance of the propensity of mankind to sympathise with each other. The rudest of them are merely excavations in the ground, and do not appear to have been longer than 8 feet, and not even stones were employed to make them more substantial. Stones, however, were often employed in constructing them. "The Aberdeenshire caverns," writes Wilson, "are constructed of huge masses of granite, frequently above 6 feet in length, and though by no means uniform either in internal shape or dimensions, a general style of construction prevails throughout the whole. Some of them have been found upwards of 30 feet long and from 8 to 9 feet wide. The walls are made to converge towards the top, and the whole is roofed in by means of the primitive substitute for the arch, which characterises the cyclopean structures of infant Greece, and the vast temples and palaces of Athens and Yucatan. The huge stones overlap each other in succession until the intervening space is sufficiently reduced to admit of the vault being completed by a single block extending from side to side. They have not unfrequently smaller chambers attached to them, generally approached by passages not above 3 feet in height, and it affords a curious evidence of the want of efficient tools in the builders of those subterranean structures that, when these side apartments are only separated from the main chamber by the thickness of the wall, the stones, though placed flush with the walls of the latter, project irregularly into the small cells, giving them a singularly unshapely and ragged appearance." These subterranean dwellings are very common in Scotland, and there is scarcely a moor perhaps in which if sought for, they may not be found.

NOTES AND COMMENTS.

It would be strange if American smartness did not gain approval in the law courts of the States, and against such an opponent as the terrible Customs Department. One lengthened case where it has triumphed has been recently concluded. The contractor for a court-house in Boston perceived that while there was an oppressive duty on wrought-iron beams, iron structures were treated more equitably. He therefore decided that his beams and joists should be temporarily united and imported as an iron structure. The Customs officer would not allow of imports to be interpreted in that manner, and insisted on levying duty on each beam. The money was paid under protest, and an action was afterwards taken to recover it. The Customs Department opposed on technical grounds, but the Courts have decided that the conduct of the contractor was entirely legal, and he is entitled to recover the money. That is a satisfactory conclusion, but we hope its importance is not diminished, as would be the case in England, by the drawback that the lawyer's fees are far in excess of the saving attained by the contractor.

THE students of the Ecole des Beaux-Arts, Paris, are about to petition the French Chambers in order to obtain some mitigation of the law of conscription, which oppresses them to an extent which was not contemplated in 1889. It was then decreed that in time of peace after a year's service, and on demand, certain classes of recruits could be exempted from further service. Among them were teachers who had signed a ten years' engagement, students of law and medicine, and others who sought after specified diplomas in the schools of arts and manufactures, or the superior commercial schools. The privilege was also given to those who were to compete for the Prix de Rome or one of the national medals in the Ecole des Beaux-Arts, and the Ecole Nationale des Arts Décoratifs. But the prizes sought by those artists are open only to a few men, while it is not difficult to obtain the certificate conferring exemption in law, pharmacy, instruction and commerce. Art workmen need only devote a year to arms, but the artists who direct them must either contend for one of the great prizes or serve like ordinary Frenchmen. The architects are especial sufferers, for only a minority aspire to a Prix de Rome. All that is sought is that young artists should enjoy similar privileges to the other professional classes, and from which they are excluded by an excess of precision in drawing up the regulations for recruiting the army.

THE majority of Frenchmen would have preferred to see that joyous veteran ARSÈNE HOUSSAYE elected to a chair in the Academy instead of his son. But as Academicians go there is no doubt that M. HENRY HOUSSAYE is more than competent. Father and son have been associated with *L'Artiste*. The latter is, however, more of a Néo-Grec. In 1868, when he was a youth of nineteen, he published his book, "Apelles et la Peinture Grecque," which is remarkable for its learning, and his essay on the antique subjects in that year's Salon was an innovation. The next year he issued a pamphlet about an antique vase in the Barbakion Museum, Athens. When the war broke out M. HENRY HOUSSAYE took his position as an officer of Mobiles, and his bravery at Champigny won for him admission to the Legion of Honour. In 1874 he gained the Prix Thiers for his two volumes on "The History of ALKIBIADES and the Athenian Republic from the death of PERICLES to the appearance of the Thirty Tyrants." He contributed many articles on art to French journals. M. HENRY HOUSSAYE wrote a volume on the siege of Paris in 52 B.C., besides others on the cities of Athens, Rome and Paris; ancient and modern art, the population of Athens in the fifth century B.C., and especially two which appeal to Frenchmen, 1814-1815. In all these works there is a seriousness which is a contrast to the paternal style, but they are credentials which augur well for the success of the latest Academician.

THE LATE HERBERT AUGUSTUS KEATE GRIBBLE.

[BY A CORRESPONDENT.]

IT is with deep regret that we have to announce the death of Mr. Herbert Gribble, on Saturday last, at his residence, 64 Redcliffe Road, South Kensington, in his forty-eighth year. Most of our readers must know and fully appreciate his great artistic talent, and the whole profession will mourn for the loss of one of its brightest ornaments. To those who enjoyed his personal acquaintance the loss will be more deeply felt, as he was a true and sincere friend, of a most kindly disposition, and notwithstanding his great and exceptional abilities was ever modest and humble minded; indeed, his love and trust in his fellow men was like that of a child. The world is apt to take men at their own valuation, and it is probably owing to this fact that Mr. Gribble, with all his brilliant skill as an artist and designer, never reaped, as he should have done if the public had been able to appreciate true genius, that prominent position he so well deserved. In thinking of him now that he is taken from us, we are reminded of others, such as Street, Burges and Godwin, and it is with such men alone that we can compare him. Like them, he had his many disappointments and grief at unfair treatment, yet he was never one to complain. He bore his disappointments manfully, and had never an unkind word for anybody, however hurt he might feel.

A few particulars of his life may be of interest. Mr. Gribble was born at Plymouth in 1847. At the age of sixteen he was articled to Mr. Norman, of Devonport, and in his twentieth year came to London and attended the South Kensington schools, where he gained numerous medals and other prizes, and a scholarship, taking the national medallion in 1864 and 1865; the first being for his design for a cathedral, a really masterly work, at the early age of seventeen years. About the year 1867 he entered the office of Mr. Joseph Hansom, where he served as principal assistant for about ten years. He was extremely clever as a painter, and one of his earliest works, an interior view of the FitzAlan sanctuary at Arundel, the first he ever exhibited, was hung "on the line" at the Academy, and was purchased by the Duke of Norfolk.

After being with Mr. Hansom for many years, he commenced practice for himself, and designed the laying out of the West Hoe Estate, Plymouth. He competed for the memorial to General Grant, in New York, being, we believe, the only Englishman who did so, and was awarded the second prize. In his native town of Plymouth there are many evidences of his skill and ability, notably an extremely quaint and picturesque group of artisans' dwellings and shops, and very extensive show-rooms, offices and warehouses for the well-known marble merchants, Messrs. J. & E. Goad. To these must be added a still more worthy monument of his ability, viz. the Armada Memorial, which he obtained in competition.

His design for St. Philip's Church, Spanish Place, although not selected in the competition, was considered by many ecclesiastical architects to be the best of those submitted; but whatever differences of opinion may exist on this point, all must admit that it was a grand conception.

A less known but yet a very beautiful little work is his convent chapel at Harley House, Portland Road.

It may not be generally known that Mr. Gribble, like a true architect should, possessed a considerable engineering knowledge, and even in his early life took several prizes for his drawings of machinery and for construction. One of his latest works, as yet, we believe, unfinished, was his church of the Holy Name, at Poona, India. We hope shortly to publish some of his masterly sketches for this.

His great work, the church of St. Philip Neri, better known as the Brompton Oratory, will always stand out pre-eminently as his monument, and a more fitting one for a sincere and devout Catholic it would be hard to find. Every detail in it was drawn by his own hand, and every stroke made was done with a keen love of the work. It is much to be hoped that the completion of this noble and costly pile will be made in accordance with the designs he prepared with such loving care. It may almost be said that he gave his life up for this work.

As a fitting mark of appreciation of his great genius his body was brought to this grand church on Thursday last, when a requiem mass was sung with all the solemnity and dignity pertaining to ritual of the Communion to which he belonged, previous to its interment in the cemetery of his parish church, that of St. Thomas à Becket at Fulham.

According to the *American Architect*, Messrs. George Ashdown Audsley and William J. Audsley, architects, have brought suit in the United States Circuit Court against the City of New York, claiming 120,000 dols. for "services in designing, furnishing and delivering plans for a contemplated new municipal building." This is the first suit brought by architects in consequence of the abandonment of the scheme for which competitive designs were invited some eighteen months ago, but it is said that other similar ones will probably be brought.

PROPOSED NEW OPERA HOUSE, ST. PETERSBURG.

FLEMISH THEATRE, BRUSSELS.

NEW ZEALAND FREEZING STORE, IMPERIAL INSTITUTE.

THE Frozen Meat Kiosk is erected in the gardens of the Imperial Institute for the New Zealand Government, the materials used being red brick for the base, the half timber work is of oak filled in between with plaster, and the roof is covered with Broseley tiles. The floor is laid with Roman marble mosaic. The freezing apparatus was supplied and fixed by Mr. LOUIS STERNE, C.E., of 28 Victoria Street, S.W. The contractors were Messrs. MOWLEM & Co., and Mr. F. H. TULLOCH, A.R.I.B.A., is the architect.

A DOORWAY BY GRINLING GIBBONS.

THIS plate is taken from a drawing by Mr. A. H. BELCHER exhibited in the Royal Academy.

THE ARCHITECTURAL ASSOCIATION.

THE usual ordinary meeting of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair. Mr. Edwin O. Sachs read the following paper, entitled

The Modern Theatre of the Continent.

Mr. SACHS said:—The last meeting of the Association at which attention was given to theatre construction was held in March 1892, when Mr. Woodrow ably discoursed on the modern development of theatre planning, and in the limited time at his disposal fully described the essential features of modern theatre construction. His paper, however, principally treated of the requirements of a London theatre, and the valuable drawings he collected for the occasion chiefly illustrated the latest examples of theatre planning to be found in our Metropolis. Now all our theatres have, so far, been the outcome of private enterprise, and there is no such thing in England as a national or municipal play-house, or even a private theatre which receives a subsidy from a public authority. Mr. Woodrow, hence, principally treated of buildings which are erected by private individuals as an enterprise based entirely on commercial lines, and where the question of £ s. d. practically stands first both for the promoters and the architect.

This paper will chiefly treat of buildings where the financial aspect, as a rule, only plays a minor part for all concerned. The theatre of the Continent is mostly a public building, in the full sense of the expression, and the play-house run as an investment, or rather as a speculation, is the exception. The theatre plays an all important rôle in the life of the localities, as the inhabitant is almost everywhere an enthusiastic theatre lover, no matter what his social standing may be. The money necessary for the institution is generally comparatively easily found, as I shall directly explain, and I would even go so far as to say that the continental theatre is the one building where a heavy list of extras above the estimated cost of the work is almost accepted as a matter of course, and met without prejudice. To quote a notable example at once. Take the Halle Theatre on these walls. The competitive conditions required a building for 21,000*l.*, the architect's estimate on receiving the commission figured 25,000*l.*, and the actual cost was 59,000*l.* Mr. Seeling, of Berlin, is the happy architect.

When I answered your honorary secretary's invitation to read this paper I had hoped to be able to treat of the modern theatre of every part of the Continent, or rather of every continental country. When I started my preparations for this evening I soon found that the field was such an extensive one that some limitation would have to be made if I wished to avoid giving you vague generalities only. I decided to risk complaints that the title of the paper promised more than it contained and to limit myself to half a continent. I must now claim your indulgence on this point, remarking at the same time that I have at any rate selected the continental countries for to-night which contain the more interesting examples of modern theatre building from an architectural point of view, and which, if I may say so, show the greatest progress in theatre planning of any part of the world during the last ten years. Northern and Central Europe will be my field to-night, or perhaps, to be more explicit, the countries in which theatre matters are treated on German lines. The Austrian empire, the German empire, the Netherlands, Denmark and Scandinavia are the countries, and the term "modern" is to cover the last twenty years. I propose, however, just touching at times on the other countries where theatre matters are managed on what I shall term Italian lines, if only to avoid giving you the

impression that I do not think there is anything new to learn there.

A paper of this kind is of course almost entirely dependent upon illustrations as far as practical information is concerned. Put up a poster here with a few short facts and inscriptions in bold type and the drawings alone will tell us nearly everything we want to know as architects. I say nearly everything. The circumstances under which the buildings are erected and their object cannot well be explained on posters. A paper, however short, would have to supply the missing particulars. That this room is so well papered to-night and can afford an opportunity for study, is mainly due to the great courtesy of the architects of the theatres in question or their employers. It is true that the originals you see were not specially sent over for this meeting, nor the many tracings specially prepared for the occasion. The latter are simply from a collection I have been making for a different purpose. The fact, however, remains, that if it had not been for the kindness of our foreign friends the principal feature of this evening would have been missing and my paper almost an impossibility. I would specially mention that it was due to the Court Office of Works and Messrs. Gruber and Hofer that we have here the late Baron von Hasenauer's new Hofburg Theatre. We are indebted to Mr. Manfred Semper for the illustrations of Gottfried Semper's Dresden Opera House, and we have to thank the Theatre Administration at Buda-Pesth for the drawings of the late Von Ibyl's Hungarian Opera House. As most of you will know, Baron Hasenauer, Gottfried Semper and Ibyl were foreign correspondents of the Royal Institute of British Architects. It is due to the great courtesy of the Czar's Theatre Administration, at the instance of their much respected architect-in-chief, Professor Von Schroeter, that I can show you tracings from the design of the proposed new Opera House at St. Petersburg. Fairly complete sets of tracings from the following theatres are also exhibited, and in reading the list I will add the names of the architects and the date of their completion:—

Amsterdam Municipal Theatre	...	Springer	...	1894
Berlin "Lessing" Theatre	...	Von der Hude	...	1888
Berlin "New" Theatre	...	Seeling	...	1893
Brussels "Flemish" Theatre	...	Baes	...	—
Halle Municipal Theatre	...	Seeling	...	1886
Laibach Municipal Theatre	...	Hrásky	...	1893
Rotterdam Subscription Theatre	...	Verheul	...	1887
Schwerin Court Theatre	...	Daniel	...	—
Stockholm National Opera House	...	Anderberg	...	(1895)
Worms "People's" Theatre	...	March	...	1890

The drawings of these theatres, gentlemen, are in various scales, and the sheets having been somewhat indiscriminately hung, I am afraid they scarcely give you a good idea of the relative sizes of the different buildings. This sheet above you, sir, has been specially prepared to facilitate an appreciation of the dimensions. We all know the late Royal English Opera House, the Palace Theatre of Varieties of to-day. Here is the block-plan, coloured red, and there are the blocks of the most important modern theatres of the Continent, all drawn one five-hundredth full size, or to a scale very near to our one-fortieth of an inch to a foot. I have supplemented the sheet as you see with another, showing our old Drury Lane and Covent Garden Theatres, drawn to the same scale, together with a number of London's latest playhouses. The difference in the superficial area of the various structures is somewhat striking, especially if we refer to this plan of the Paris Opera House, and see how many London theatres we can stow away in its different parts. You see the English Opera House complete fits well on to the stage, our Court Theatre just goes into the auditorium, and Terry's Theatre into the grand staircase. It would be quite easy, as you see, to show the Parisians or the Russians the "Lights of London" with full-size Adelphi and Vaudeville façades on their Grand Opera House boards.

CLASSES OF THEATRES.

Now, gentlemen, it is quite common to hear the greater size and the elaboration of the continental theatre to be simply ascribed to the advantage of "State aid." In reality "State aid," as we understand it, is by no means the important factor it is represented to be over here. The number of national or government theatres abroad is comparatively very small. The majority of the theatres are the outcome of municipal efforts, the results of voluntary subscriptions and guarantee funds, or the liberality of royalty. Continental playhouses can be classified as follows:—

- I. Court theatres.
- II. National and government theatres.
- III. Municipal or district theatres.
- IV. Subscription theatres, with or without court, government or municipal subsidy.
- V. Private theatres, with or without court, government or municipal subsidy.

The private theatre alone is intended to be a money-making concern, which will amuse or educate its patrons according to the local requirements. The others are built without any mercenary motives, either :—

1. For the satisfaction of luxury;
2. For educational purposes;
3. For recreative purposes;

or for a realisation of any two of these intentions, and even all three in exceptional cases.

Court Theatres.

The court theatres are essentially the luxury of royalty, originated and kept up at their expense. The enjoyment of the entertainment given at these playhouses is, however, now mostly open to all comers on a payment for admission. The payments go towards defraying the costs of the management, and it rests entirely with the royal owners to what extent the public is allowed to avail itself of the opportunity of entertainment and at what figure. The public visit the playhouse on sufferance, to enjoy the exhibition at a smaller outlay than would be their lot if the institution were run on commercial lines. The audience is, to a certain extent, the guest of the royal owners. The court officials, &c., and all officers of the army and navy are generally on the free list of the court theatre, and university professors and other lights of learning frequently only have a nominal fee of entrance to pay. Art is encouraged on the stage, and the attendance of the cultured courted in the auditorium. As the admittance charged to those who do not enjoy the privileges is, comparatively speaking, expensive, the audience in all parts of the house is generally of a fair social status. An exception is only made on rare occasions of national festivity, when the auditorium is thrown open to all comers free of charge. Patriotic plays are then mostly performed, and the holiday-maker takes his seat in the stalls or gallery according to the rule of "First come, first served." It would be well, perhaps, to at once notice what pride most courts take in their theatres, and that the royal owners frequently use them for the entertainment of guests, public receptions, &c. No series of court ceremonies abroad is complete without a visit to the court playhouse, and it is not unusual for all the seats to be filled by special invitation only, the gathering ranking as a court function, not dissimilar to our annual State concerts at Buckingham Palace.

Government Theatres.

The national or government theatre is as a rule run on the same lines as the court establishments, with the exception that the foundation and maintenance of the institution is officially held out to be chiefly in the interests of art and education, whilst the court playhouse is generally boldly recognised as the outcome of luxury. The perquisites of officialdom in the shape of free tickets, the facilities afforded to the learned, and the high prices of the seats for the unfavoured generally, again make the auditorium the rendezvous of the cultured and moneyed. The nation, as such, undertakes to pay all expenses, but by dint of good management the admission fees not unfrequently substantially reduce the burden of the government exchequer. The national theatre in a way stands on a par with the national museum or picture-gallery, with the two exceptions that there is generally less to learn at the former and admission to all comers is far easier at the latter. The doors of the theatre, it is true, may be thrown open to all on special occasions, but unfortunately the percentage of the population that can avail itself of this permission is small indeed. The national theatre, which is kept up out of the country's taxes, is practically reserved for the office-holders, the *savants* and the moneyed, the latter again enjoying the entertainment at a lesser cost than would be the case if they visited an establishment run on money-making lines. It is doubtful if really much is done at the government institutions for art and education, and if the little really accomplished is beneficial or the reverse. The Paris Opera House, for instance, gives one of the worst performances it has been my lot to see. Politics are not unknown on the government stage, and party opinion has influenced the selection of many a play, its representation, and even its caste. One thing we should, however, remember, and that is the position the government theatres occupy as the show-places of the nations that have built them. In the same way as the court theatres, though perhaps not to the same extent, the government, royalty, or the officers of State, as the case may be, avail themselves of these institutions for hospitality and ceremonial.

Municipal Theatres.

The municipal theatre is generally intended for educational and recreative purposes; all classes are free to enjoy the entertainment at a minimum cost, and outside the actual outlay for the building, the ratepayers, as a rule, only have to make up the small difference between the actual expenditure and the amount of admission money received. This difference, of course, varies according to the success of the pieces. There

are no profits to make, no great risks to cover, and the inhabitants hence have their entertainment at cost price. Of course there are endless variations in the management of a municipal theatre. The favourite way latterly has been to put the building and fittings, which have been paid for out of the rates, at the disposal of a good manager, and to allow him a small subsidy conditionally that a fixed approved scale of admission and booking charges is not exceeded. Would-be lessees compete for the post, stating to what extent they require to be subsidised. Great care is taken to fill the office with a good man, whose substantiality is also unquestionable, and there are generally severe conditions as to the class of performance, the number of novelties to be produced annually, and the condition in which the building is to be kept. A heavy surety has to be found by the lessee to cover all eventualities. Contracts between the manager and the municipality generally date for a number of years at a time, and when a new lessee is once engaged, matters as a rule run very smoothly. As the great ambition of the municipality is to give its ratepayers good performances at a minimum cost, free lists, which would cost the management so many valuable seats, are not allowed, and at the most we hear of a reduced price in certain parts of the auditorium for students, and the customary special privileges which are allowed to army officers in most military States. You will be pleased to hear that the heading "students" covers the juniors in the architectural profession if they happen to attend a technical college or academy. The architectural student, like his university fellow, classes abroad as a cultured but generally impecunious individual. In exceptional cases the municipal theatre is considered in the light of a reception hall, where the authorities entertain distinguished guests, and the prominent inhabitants pay their visitors the compliment of attending in their best. Then it should always be remembered that the theatre is a recognised regular rendezvous for the different social sets of the community. Families of all grades have their particular evenings for the play. In the stalls different cliques meet periodically, say weekly, and likewise in the galleries, say monthly. On one night you may be sure of meeting a rich banker set in the best part of the house, and plumber Jones and his friends are sure to be on the cheaper seats. The next night it may be the army officers' clique in the best seats, and a certain railway signalman and his party will also be found in the auditorium. The municipal theatre is a public assembly hall in the fullest sense of the word.

Subscription Theatres.

The subscription theatre is run on lines similar to the municipal institution, with the great difference that its existence is primarily due to a desire on the part of the cultured and moneyed to satisfy their desire for the luxury of a good play. Education and healthy recreation are no doubt encouraged almost to the same extent as at the municipal establishment, and they serve as the official *raison d'être*; but for all that, the initial expense is incurred by the moneyed for their own private ends, though their contributions may certainly also be partly considered as a gift to their locality. The subscribers who build the theatre frequently reserve to themselves the privilege of selecting seats, but otherwise their share in the enterprise generally gives them no distinction. They, in fact, probably have to guarantee to cover any losses if they manage the place themselves, or if they have a lessee in our sense, may be required to promise him an annual subsidy or box rental. Subscription theatres but seldom receive assistance from government or court exchequers, though there have been one or two notable cases in Austria. The municipality, however, generally gives substantial help, partly perhaps in the form of a good site, and partly perhaps in form of a subsidy to cover the expenses of keeping the building in general repair. The erection of a subscription theatre, it should be remembered, generally lets off the municipality very cheaply, as an outcry for a new playhouse would always have to be satisfied sooner or later, and were it not for the voluntary helpers, this would be at the entire cost of the ratepayers. The perquisite system is of course again barred, though the student and officer may again have some special reductions. Subscription theatres have again originated through a nationality or coterie clubbing together with some particular purpose in view. Imagine, for instance, Scotchmen in London combining to have a Caledonian comic opera for the advancement of their national humour. Well, this essentially Scotch institution would only be open to the naturally humorous Irishman, for whom the building is of course not intended, on heavy extra payment, whilst all the men of Brae would enjoy their evening very cheaply. Theatres abroad have also been built in this way in combination with club premises, the whole block being the rendezvous of the nationality or clique in question, and at the same time the show-place where their particular fêtes are held. The latest outcome of the subscription theatre is the one which is built and run essentially on philanthropic lines for the education and recreation of the working classes.

I shall refer to this class of establishment at the end of this paper.

Private Theatres.

The private theatre abroad is managed on precisely the same principles as our own. In exceptional cases private theatres receive subsidies from the Government or municipalities to facilitate the production of new plays, subject to conditions as to the charges of admission, but these cases are very rare indeed. Subsidies by political parties for the furtherance of their interests are, however, not quite so uncommon. This I lodge, by-the-by, gentlemen, I should recommend to some of our political agents who have such difficulty in escaping the clutches of the law. The unsubsidised private theatre is, as a rule, to be found only in large cities where there is plenty of room for such enterprises beside the official institutions. The managers, however, have to take care that their buildings do not contrast too greatly with those of the privileged establishments; and the result of this competition, I would remark, is not only that the standard of their performance is very high, but that the comfort of the audience receives more attention than is customary in this country.

Now, gentlemen, I may seem to be taking up too much time with indications as to the various purposes of the foreign playhouse and the many methods of financing these institutions, but the particulars will, I hope, facilitate your appreciation of the circumstances under which our foreign confrères work and help explain his drawings as intended. In these days, when the pros and cons of giving some of our towns municipal theatres are really being seriously discussed, I also hold that some knowledge of the actual circumstances of the foreign institutions may be found useful by the members of this Association as ratepayers and advisers. Englishmen, we all know, are gradually becoming inveterate theatre-goers, and though the municipal stage may yet be far distant, I see no reason why the subscription theatre, and perhaps more especially the people's theatre, should not reach our shores in the near future.

Well, gentlemen, you will have observed I have so far avoided all allusion to the kind of entertainment provided in the continental building.

CLASSES OF ENTERTAINMENT.

As the architect's plan of course entirely depends on the performance to be produced, I must now add the missing particulars. In the first place, let me point out that the home of the variety entertainment will not be under consideration to-night, though some reference might have been quite *à propos* to the great storm in a teacup which lately raged about our Empire Theatre. I can only deal to-night with the home of opera and drama. Operas are but seldom found in private institutions abroad. At the most we hear of a private *opéra comique*. The private theatre is practically always the home of the different kinds of drama. Most of the government and court theatres only bring out operas, and are *bona fide* opera houses, and there are also a few municipal and subscription establishments that can also boast of this much-coveted name. There are a number of municipal and subscription theatres which are the home of drama in its many forms, and there are some rare examples of government and court institutions entirely devoted to this art. As a rule, municipal and subscription theatres, and to a certain extent the theatres of the minor German courts, are built both for opera and dramatic performances, which alternate nightly or weekly as the case may be. The successful planning of these houses depends almost entirely on the clever adaption of both stage and auditorium to this double purpose—a difficult task indeed, as the requirements for the successful production of a comedy or tragedy are so very different from the essentials of a grand opera. To enjoy a drama the audience must literally be with the actors, every gesture should be seen and every whisper heard. The actors do not require much space; in fact, their surroundings should be on such a scale that there is no fear of their appearing lost on the stage. At the opera the effect depends more on the *tout ensemble*; the gesture and intonation of the individual actor are not all important to the general public of to-day. Room is wanted on the stage, ample space for elaborate scenery, choruses and ballets. While the proscenium opening of a modern dramatic stage should not exceed 30 feet, and the auditorium should not be larger than for 800, an opera-house proscenium opening can well measure 60 feet, and the auditorium hold 3,000. Anyone who visited the French plays at Drury Lane will remember how much of the beautiful acting was lost upon the majority of the audience, whilst the German opera could be fully appreciated in every part of the house.

The promoters of the court, municipal and subscription theatres are often prone to attempting extremes, and I have several times seen what I would term a chamber drama put on the same stage on which a grand opera was mounted the night before. The satisfactory makeshift is only possible where the promoters at once make up their minds for a compromise in their bills. Small operas, operettas and burlesques will suit the same house that was built for full drama. Why not cut out

the grand opera and the chamber play? With the aid of clever planning the audience may then fully appreciate the entertainments, while the most ingenious architect with all the assistance to be had from a movable proscenium or the American style of shutting off part of the auditorium would not be able to satisfy the different audiences. At least this has been so far everywhere the case. It is true I once heard of hydrogen being used to assist the wafting of a tragedy whisper far up into an opera house gallery, but this device was too expensive to allow of its general introduction.

There is one thing yet, gentlemen, that I would here wish to point out when speaking of the various classes of entertainment given, and that is the constant change of bill in all, or nearly all, continental theatres. The same play is but seldom given for two nights running. Excepting perhaps at a private theatre, once or twice a week would probably be the most. This necessitates a much more roomy stage than for theatres where the same piece is given night after night, and this again quite independent of the storage accommodation, which may or may not have to be provided under the same roof. Where things are not put into the same place night after night there must be ample room for moving about and plenty of space for the reserve; actors, managers, engineers and the lighting department all want more accommodation.

Now, gentlemen, ends what I will term my intended indication of the circumstances under which the modern theatre of Northern and Central Europe is erected. I know I have been very lengthy, but I trust, as I have said before, that besides assisting your appreciation of the drawings these particulars may one day come in handy to you, when the promotion of public theatres really stands on the same ground as the free library movement of to-day.

To attempt a description of the buildings which are illustrated on these walls, to try to describe the requirements which had to be fulfilled in the individual theatres or even classes of theatres, would, I am afraid, lead too far. I must limit myself to pointing out some of the more important features of the continental theatre, and at the most can preface this with an allusion to the spirit in which the foreign architect is expected to do his work. Here I must, however, again crave your indulgence. I shall actually venture to make some laudatory comments on the architecture shown in the modern continental theatre, and that in a room where sweeping condemnation and pessimism for everything the modern architect does seems unfortunately to be lately considered attractive. Of course I principally refer to Mr. Beresford Pite's teachings. One of the last results of his interesting philosophical analysis of modern architecture was, it will be remembered, at the meeting before last, when he considered the Paris Opera House was an abortion. Well, Mr. Chairman, I believe I am quite in order if I here take the opportunity of protesting against a sweeping condemnation of this kind.

(To be continued.)

RHIND LECTURES IN ARCHÆOLOGY.

A SERIES of lectures has been opened by Dr. Christison, secretary of the Society of Antiquaries of Scotland, Rhind Lecturer for the current year, who has chosen for his subject "The Early Fortifications of Scotland."

In the first lecture he dealt specially with mottes. To begin with, however, he noted the neglect with which the subject of early Scottish fortifications had been treated by archaeologists, the chief cause of this apathy being the strong classical bent of the archaeologists of the day, who despised all field works that could not be ascribed to the Romans. In our own day the cause of neglect had been the supposed monotonous and uninteresting character of the remains, and so a subject which concerned some sixteen hundred structures had yet been but little studied in detail or systematically. Difficulties there were in the unreliable character of previous observations and in the ruinous and vague condition of the remains themselves, and excavation was still required to reveal the nature of the works, and little had yet been done in that way. When they considered the eagerness with which our countrymen had carried out excavations abroad, it was surprising that the buried forts and towns at home should be so much neglected. In dealing with the subject he had adopted the division into (1) mottes, (2) rectilinear works, and (3) curvilinear works. In treating of mottes it was necessary to get rid of the modern signification of mote as the ditch of a fortress. The mottes of which he was to speak were, in their simplest form, artificial flat-topped mounds, defended by palisades round the edge; and considering that these were the fortresses of England during the Saxon period, and that a large number still existed, they had attracted surprisingly little attention in modern English general literature—a state of oblivion which might be attributed to the revolution in the meaning of the word, the confusion of moot hills or meeting places, and the fact

that they were not contemporarily known as mottes. The most typical examples of the mote were to be found in France. There were contemporary notices of them; and from De Caumont we learned that they were the castles of France during the tenth and eleventh centuries, and that they consisted of a base court defended by a palisade, earthen rampart and trench, with a rounded eminence at one end or in the centre, artificial or natural, on which stood a citadel, in general of wood, but sometimes of stone. The characteristics of the English mottes were the same, the mound being sometimes partly or wholly natural. Of these fortresses fifty were mentioned in the Anglo-Saxon Chronicle, and about twenty-one still existed, the date of erection being known. But altogether 265 in England and eighteen on the Welsh Borders were mentioned by Mr. Clarke. They appeared to have flourished as early as the first half of the fifth century, but the first contemporary notice was by Bede, about 727. They appear to have been only gradually superseded by the Norman castles, and a wooden castle at Shrewsbury was mentioned as late as the reign of Edward I. While these were called mottes on the Continent, there was reason to believe that burh was the name by which they were known in England. Although 150 mottes were marked in the Ordnance map of Scotland, their existence had fallen into almost complete oblivion, and even antiquarian literature was almost silent on the subject. Not a single instance of the attack or defence of a mote in Scotland could be quoted, and history was equally silent as to the use of moot hills. But there was no lack of evidence to prove that the names were no mere modern invention. The number of mottes recorded in the Ordnance map was brought up by private research to 180. Of these, thirty-eight might be considered as quite satisfactorily made out, because they were conical flat-topped mounds, trenched and, in some cases, ramparted at the foot. Thirty-six others had the round mound only, the entrenchments, if they ever existed, having disappeared before agricultural extensions. Nineteen mote-like mounds, terraced or ramparted, or partly both, on the slope, but not fortified at the base, came next; and, lastly, there were six low mounds or circular level spaces, environed by a trench, generally on a low marshy plain, which might be included, as they were locally known as mottes. Thus about 100 of the mottes had some claim to the title. The distribution of the mottes showed that their great centre was Kirkcudbright, which contained seventy-six. From this centre they spread into Wigtown and Ayr. There were one or two in Renfrew, three or four in Lanark. Eastward, they were common enough in Nithsdale and Annandale, but beyond that there were but three or four in the most Saxon part of Scotland. There were fewer still north of the Forth. Their scarcity in Saxon Scotland, compared with Celtic Galloway, seemed very extraordinary. Possibly it indicated a strong Saxon occupation at one of the periods of invasion and conquest, brought to light by Skene; but it was strange that the name burh, supposed to have been applied to them in England, should have been supplanted by the name mote. As to the conclusion of the period of the Scottish mottes, all that could be said was they ceased to be used at the beginning of the fifteenth century, as they were used in charters of that and the following two centuries not as fortresses, but as subdivisions of land. The Scottish mottes were generally very small. The number of purely artificial mottes was also very small, and the variations from the original type were sometimes so extreme as to leave little difference between them and the ordinary hill fort.

In the second lecture Dr. Christison referred to "Rectilinear camps and Roman camps, stations and outposts." He at the outset expressed the deep gratitude that archaeology owed to General Roy, if it were only for his plans of important structures, some of which had been entirely obliterated since his day. These plans when tested by such of the so-called camps as survived seemed to be quite accurate, except in minor details. But the same faith could not be placed in the elaborate structure of conjecture and theory that he founded on his plans, any more than in the similar work of other early antiquaries, who, like him, were too apt to follow the dangerous method of hunting for and finding objects where they wished to find them, and who accepted as Roman every rectangular enclosure, simply because it was rectangular, without further question. When the subject was approached in this loose and unscientific manner it was no wonder that the map of Scotland became thickly dotted with Roman camps, so that no less an authority than Mr. Hill Burton asserted that there remained acknowledged as Roman a sufficient number of works to create a special topographical feature of the country, and that they were so numerous as to justify the belief that there were more known and recognised Roman camps in Scotland than in all the rest of the world. The time had come when the evidence on which this bold and startling statement rested should be sifted. Dr. Christison then indicated that it was particularly from a structural point of view that the question could be studied most hopefully, and the best mode of setting about it would seem to be to ascertain what

were the characteristics of proved Roman field works. It was on the Wall of Antonine that we stood on the surest, perhaps the only assured, Roman ground in Scotland. Yet even here the thoroughly Roman character of the work as it was left to us might be questioned. Taking responsible authority, we found marked on the Ordnance map, or given by General Roy and Mr. Vere Irving, a total of seventy-four military field works attributed to the Romans, without counting the great wall and its forts. The classes into which these might be divided were three. There were first large works with a single entrenchment. These exceeded 1,500 feet in length and were generally rectangular and rectilinear, but sometimes rhomboidal and with the sides slightly curved. Their claim rested mainly on the belief that every rectangular field work must be Roman, a claim that was finally disposed of when it was made known by General Pitt-Rivers that rectilinear forts existed in Ireland where the Romans never set foot. It was also claimed for most of these that they were temporary camps on the line of Agricola's armies, but as far as the lecturer's experience went, there was very little of that agreement in size and shape which ought to exist among them if they were the successive camps of an army on the march. The second class consisted of small rectangles with a single rampart and trench. Thirdly, there were rectangles with several parallel entrenchments. Well-ascertained examples of this class, all of them works of great strength, were Birrens, Dumfries; Lyne, Peebles; and in Perth the camps at Strageath Mains and Ardoch. The lecturer entered into a detailed description of Ardoch, and mentioned that it apparently differed from all the circular and oval forts he had examined in its trenches being entirely depressed below the original level of the ground, instead of their depth being partly due to the excavated earth thrown up in front or rear of the trenches. Ardoch was not the only rectangular work in which he had noticed this, and possibly it might prove to be a characteristic distinction of certain classes of the rectangular type. In respect of the use of flanking defences at the angles, Ardoch stood alone among Scottish forts as far as he knew. The lecturer then dealt with the remaining works ascribed to the Romans in Strathearn and the neighbourhood, all of which he investigated on the spot last summer. Having described a well-marked example of the small rectangular class near Ardargie Mains, he mentioned twelve other alleged Roman works in the district either not rectilinear or slightly so. All of them were marked in the Ordnance map, but he knew not on what authority. Their sites were Crieff Junction, Ogle Hill and Ben Effery, Cultoquhey, Kaims Castle, and the south edge of Tullibardine Moor, while five were on the line of the Roman road running south from Strageath. Lastly, there was the Roman Camp at Fendoch, Glenalmond. Of all these, he declared, five had nothing to distinguish them from ordinary native forts, two others were nondescript, but with not the slightest sign of Roman workmanship, and the claim of the remaining five, trifling mound-circles, 30 to 40 feet in diameter, rested apparently on their close proximity to a supposed Roman road. Discussing the evidence that the four camps of the Ardoch type are Roman, he pointed out that the most direct testimony we could expect would be the discovery of Roman remains within any of them. Author after author had positively asserted that the only inscribed Roman stone found north of the Forth was discovered in Ardoch, and that a number of Roman altars now in the National Museum of Antiquities were found in Birrens. But, unfortunately, when traced back to the original authorities the statements on these points were not so clear as could be wished. The whole evidence, he concluded, pointed to the Roman origin of the works of this class, but further investigation was necessary before it could be said with confidence that they were Roman. Finally, Dr. Christison discussed the import of "Chester" as a place name in Scotland, which, he said, had some bearing on the Roman question. It was natural to claim for the name "Chester" in Scotland a direct origin from the Romans, and it might be alleged in favour of this view that it was entirely confined to the parts of the country supposed to have been most firmly possessed by that people. But, on the other hand, he mentioned as objections which seemed to be fatal to this theory that the name was not found on the line of the Roman Wall, or at any of the so-called Roman camps and stations, or at any place where relics of the Romans had been found. He suggested that the natural origin of the name was from the Romanised Britons, who might be expected to continue the use, in some form or other, of the "castrum" employed by their Roman masters, and to have handed it on to the Saxons as the "cesters" or "caestres" which occurred so often in the early pages of their history. It was remarkable, however, that whenever Bede mentioned one of these "cesters," he took pains to explain that the name was English. Evidently, therefore, "cester" was thoroughly naturalised among the Saxons at a very early period, and there was no difficulty in understanding how the Saxons might have brought with them to Scotland a name for a city which was already so

familiar to them. But the real difficulty was to explain why, the English "Chesters" being all cities or places of importance, the Saxons, on entering Scotland, should apparently have conferred the name on a number of small and obscure forts not differing in site or structure from the numerous forts around them which were not called "Chesters." Certainly the present status of the "Chesters" in England and Scotland was very different, for while in the former many considerable towns bore the name, in the latter it was confined to mansions, farm-houses and old forts.

The special subject of the third lecture was curvilinear forts or forts proper—not including the brochs—of which there were, he said, some 1,100 examples. These were densely crowded in some parts of the country and thinly spread or absent in others. Between the Mull of Galloway and Greenock the number was only about fifty, but the remarkable point was that, with scarcely an exception, they were all within a few miles of the coast; and landward they were separated from other groups by a vast tract absolutely devoid of forts. But nowhere was the isolation of groups more remarkable than in the Highlands. On the mainland of Argyle and the neighbouring smaller islands, not only was the isolation from the rest of the Highlands very marked, but the distribution within itself was very peculiar. The total number of forts was no less than 176, but of these the northern part of the district had only three, and the district of Kintyre and running north from the Mull for ninety-five miles contained 143, all upon the coast or within a mile or two of it. In the Highland mainland, without Argyle, the forts were extremely few, occurring in remarkably isolated groups. The great elevation of the Scottish forts had been alleged as a reason why they were merely intended as temporary refuges; but even at the present day in the eastward parts of Europe, where life was insecure, the peasants retired at night to villages perched at great elevations above the fields which they cultivated during the day. As a rule, the builders of these forts sought for some natural strength of position, but not invariably, and a considerable number of sites were on low and level ground. Our detailed knowledge of the forts was insufficient to enable us to classify them systematically, but some eight species could be described. These were:—(1) Entrenched works, entirely of earth; (2) entrenchments with ramparts of earth, purposely mixed with stones; (3) forts with walls of loose heaped stones; (4) forts of dry masonry; (5) forts of dry masonry and timber; (6) forts with an inner wall of stone and outer defences; (7) terraced forts; and (8) vitrified forts. Of these the forts of dry masonry had been by much the largest class, especially in the Highlands, and it was there that they could study their structure with any satisfaction. There it was found that the walls consisted invariably of more or less well-built faces, with a core of rubble, the whole sometimes as much as 14 to 16 feet thick. Of the original height one could not speak, but 8 to 10 feet was the greatest remaining height. We were equally ignorant as to how the walls of the Scottish forts were finished at the top; but in Ireland, according to Dr. O'Donovan, the walls were carried up above the core so as to form parapets. In none of the Scottish walls had there been detected any sign of division into longitudinal compartments, but in the South Fort at Luign and elsewhere traces had been found of chambers in the thickness of the wall. The apparent total absence of port-holes or windows was another remarkable feature. As to the so-called vitrified forts, the precise nature and object of the vitrification was still a matter of dispute after nearly a century and a half of controversy. Was the vitrification structural and intentional or merely accidental? In discussing this question the lecturer examined the views of past authorities on the subject. Next he described the specimens which he had himself examined. Not less than fifty-five forts in Scotland had been described as vitrified; but even allowing that there was such a thing as a vitrified fort—that was to say, a fort purposely vitrified—very few of the pretenders could establish any claim to the distinction. From his first experiences he should have said none of them could, but the sight of Carradale, in Kintyre, had somewhat shaken his first opinion. Of the fifty-five, only twelve showed proof of considerable vitrification, and in these the vitrification was only partial. The vitrification was not founded on the ground, but rested on loose stones, and it was more perfect at the top and sides than in the centre. It was difficult to understand the object of vitrification, if it had any, and he could only suggest that it might have been to consolidate the top to give a firm footing to the defenders. As to the general plan of the forts, they were, where the site allowed, generally circular or oval in form, with variations to suit the nature of the ground. Many had but a single entrance, but two were common. In forts of the complex plan, generally of the earthen type, the entrance sometimes passed straight through two lines of defence, sometimes was zigzagged. Not infrequently it was retired, so as to give a flanking defence. Traces of traverses, so as to check the rush of an enemy, all round the enceinte had been seen in stone forts; and occasionally there were signs of

detached outworks. In every district he had visited structural remains had been observed in the interior of a considerable number of forts; and even in those where there were no remains it did not follow that they were not regularly inhabited, as the houses might have been of flimsy, easily perishable material.

THE GLASGOW SCHOOL OF ART.

THE opening lecture of a series on architectural study in the Glasgow School of Art was delivered on Friday evening, in the Lecture Theatre, by Mr. Wm. J. Anderson. Among those present were Mr. Campbell Douglas and Mr. Francis H. Newbery, the headmaster, and there was a large attendance of students. The lecture was a *résumé* of the evolution of architecture from the earliest times to the end of the Gothic period. It was pointed out that the history of architecture, like all other history, teaches that there is no such thing as continued and maintained progress and advancement. Thirty centuries before Christ some of the grandest architectural works in the world were erected—*e.g.* the temples of Karnac and Luxor, buildings which, at least in the qualities for which they are distinguished, have never been equalled. Besides that of Egypt, another important source of influence was the art of Assyria. Those met in Greek work, which, making use of the forms of both, combined also the majesty and dignity of Egyptian architecture with the freedom and picturesqueness of the Assyrian, and added great intellectual refinement and grace. The arch, freely used by Egyptians, Etruscans and Greeks in underground and engineering work, was only raised by the Romans to the dignity of a constituent part of the architecture. The Romans also made a more extended use of the vault and dome. Byzantine architecture was described as being merely the later architecture of Imperial Rome transferred to Byzantium, and there coloured and influenced from the East. The Byzantine architects continued the development of the dome. After the break-up of the Roman Empire decline in every respect followed in the western part, and for centuries art was crushed out of existence till the rise of the Lombard Romanesque. The progress of this style in Italy and Germany was noticed, and the contemporary phases known in this country as Saxon and Norman. The lecture concluded with a short account of some of the English cathedrals, illustrating the history of the Gothic style at home. Upwards of seventy lantern slides, besides diagrams of great buildings, added to the interest of the lecture.

DUBLIN, ANCIENT AND MODERN.

A LECTURE on the above subject was recently delivered in the Molesworth Hall, Dublin, by Mr. L. R. Strangways, vice-president of the Photographic Society of Ireland. Mr. Strangways said he proposed to take his audience for a stroll through the city, such a one as he often took with his hand camera. Speaking of the buildings of Dublin, the late Sir Samuel Ferguson had said:—"We live in Dublin in the midst of great but unnoticed beauties. If our Custom House stood on the banks of the Grand Canal at Venice we should soon see in the windows of our photographers something which would strike every eye as a lovely novelty." The first settlement of Dublin was lost in the mists of antiquity, and he needed not to trouble them with discussion as to whether the name signified "The Town by the Hurdles," or, as they were more apt to suppose, "Black Mud." The original walled town lay altogether on the south side of the Liffey, and was of extremely small size. The direction of the walls was settled to some degree by the course of the rivers Poddle and Liffey. The Poddle had been for so long arched over that many of them were almost unaware of its existence; yet it is even at the present day employed to drive a mill in the very heart of the city, and he had been informed that the damming of the stream necessary to give the required water-power was the main cause of the flooding of the Poddle which was attended with such disastrous results in St. Patrick's. In no respect did old Dublin differ more from its modern successor than in the absence of bridges. Just as in London until 1750 London Bridge was the sole means of communication with the southern suburbs, so in the case of Dublin, "The Old Bridge," built in 1428, stood alone. In 1700, however, there were five bridges across the Liffey. Of the great circling wall, with its towers and gates, no vestige remains. Audoen's Arch is almost the sole relic of the walls of Dublin, and it very narrowly escaped being pulled down in 1880 by the City Fathers on the amazing plea that it was impossible to keep it clean. A portion of the old graveyard close at hand has been laid out as a recreation ground. The lecturer then exhibited a photograph of Speed's map of Dublin, made in 1610, showing the very extensive colony which had been established by the Danes on the north side of the river, and the abbey of St. Mary and church of St. Michan which

had been erected. The Liffey at that time came within a very short distance of the spot where the walls of Trinity College now stand. In 1649 Ringsend was the harbour of Dublin, and Cromwell landed there in that year. Vessels of from 50 to 100 tons could only enter the river; but so greatly has the harbour been improved since that time that the *Great Eastern*, the largest ship yet built, could enter the river and lie beside the quay wall. This improvement was chiefly due to the establishment in 1708 of that mysterious body known as the Ballast Board. The soil dredged by them during 130 years or so has been used to fill up the slob lands which existed, and on the lands so reclaimed from the sea stand many of the finest streets, such as Brunswick Street, and on the north side all the district below the Custom House. Essex Bridge was built in 1676 with the stones of St. Mary's Abbey, and had a number of little shelters for foot passengers. The bridge was rebuilt in 1756 in a new form as an exact model of Westminster Bridge in London. The present bridge has been widened by metal wings and the arches lowered. Beside Essex Bridge in 1707 was built the Custom House, but the building was found too small for the increasing trade of the city, and in 1781-91 the present glorious pile was erected. After referring to the Custom House, Post Office, St. George's Church and the ancient abbey at St. Mary's, the lecturer brought his audience to St. Michan's Church, built by the Danes at a very early period in the midst of their colony. With regard to the Four Courts, two great artists shared the honour of its erection—Cooley and Gordon. There are some fine statues in the hall, but the statue of *Truth*, which stood originally in the centre of the hall, was deemed so unsuitable an ornament that it was removed to the lawn of the King's Inns. Mr. Strangways also referred to St. Audoen's Church, Christ Church Cathedral, the old Dublin Tholsel, and St. Werburgh's Church, in connection with which many points of exceeding interest were mentioned. The City Hall was built originally as a Royal Exchange, which was erected from Cooley's designs in 1769, and stands on the site of an older Exchange, Lord Cook's House, afterwards the famous Lucas Coffee House. The foundation rests on a belt of rock which runs from this spot under the river as far as Liffey Street, and is called "Standfast Dick." The older styles of Dublin architecture are rapidly being improved out of existence, and we now possess few even of the Queen Anne period houses, and none of earlier date.

GLASGOW INSTITUTE OF ARCHITECTS.

THE following is the full text of the letter addressed to the town clerk, Glasgow, of which an abstract has been given:—
115 St. Vincent Street, Glasgow :
November 21, 1894.

Sir,—The Council of the Glasgow Institute of Architects desire respectfully to ask the attention of the Honourable the Lord Provost, the magistrates and the Town Council of Glasgow to the designing of the public buildings of the city.

In the case of the municipal offices in George Square and that of the art galleries in course of erection by the Association for the Promotion of Art and Music in Glasgow, a desire was shown, and some consideration given, to secure that the designs should be worthy of the important purpose that each of those buildings was to serve. With buildings of secondary, but still of great importance, no corresponding effort is made. The Council of the Institute submit that the design and arrangement of such buildings are, as much as those of the larger edifices, worthy of every attention and care that can be bestowed on them.

The Council of the Institute are of opinion that the designing of important public buildings cannot be satisfactorily done by the department of the master of works or of the city engineer, and still less when the head of that department is an engineer than when he is an architect. The duties of the office include, among others, the charge of the public streets, and the design and superintendence of numerous and important works of engineering, as well as assisting and advising the committees of the Town Council in connection with health, gas, water, paving, sewerage, city improvement trust, railway and subway operations, and many other works, and it is evident that in a city of such magnitude as Glasgow, these duties must be of a very onerous nature. To relegate the designing of important works of architecture to the assistants of a gentleman who is responsible for the efficient discharge of such duties as the foregoing, and who is himself not an architect, seems to the Council of the Institute to indicate a want of appreciation of the position which architecture should occupy in an important city.

The Council of the Institute refer to the practice prevailing in most of the large English cities, and to the recent appointment of a committee of the City Council of Sheffield "to inquire and report whether or not the city surveyor might reasonably be expected to undertake the responsible architectural work of the city, and also satisfactorily discharge his other duties." This

committee have made an interim report with reference to certain proposed additions to one of the city court-houses, and after full inquiry have advised the Council that in their opinion "the city surveyor could not reasonably be expected to undertake the preparation of the necessary plans and detailed drawings for the additions." The City Council have since adopted this recommendation and have entrusted the work to a firm of independent architects.

In asking for the full consideration of this important subject and the appointment of a committee to inquire and report regarding it, the Council of the Institute solicit the attention of the Town Council to the following as a summary of their views:—

1. The city engineer, as he is not an architect, is not himself qualified to design works of architecture. Even if he were so qualified, the duties of his office are such that he cannot have the time at his disposal for the quiet conception and elaboration of the design of public buildings, nor for the efficient superintendence of such works in course of erection.

2. To depute such work to assistants, however qualified, cannot be so satisfactory as it would be to commission independent architects of ability and experience. An assistant has neither the stimulus nor the sense of responsibility of an independent architect, and there is no assurance of permanence in his position. Should he develop marked ability, it is probable that he will either elect to practise in his own name, or accept an office of more importance in another city. In dealing with contractors, in securing that the terms of a contract are faithfully carried out, and in the settlement of accounts an architect has more authority, as he has more direct responsibility, than any assistant, however competent he may be.

3. The existing arrangement is not an economical one, and on this ground alone the subject is worthy of full consideration.

4. The design and erection of the public buildings of a city are among the opportunities that architects are entitled to look to for the exercise of their abilities, and their employment would offer to the authorities a much wider field for the selection of architects possessed of special qualifications for particular work, than they can have among the assistants of the city engineer. The Council of the Institute do not undervalue the knowledge and experience of the master of works, of the city engineer, or of their staff, but they believe that the attainments of these gentlemen would be of more advantage to the community, so far as important public buildings are concerned, if they were used in the first place in advising the committees of the Town Council in charge of such works, and afterwards in consultation with the architects who should be employed to design them.

5. It is among the most important duties of a municipality, acting on behalf of the community they represent, to foster and encourage the arts, and particularly the art of architecture, upon which the amenities of a city are more dependent than on any other. The council of the Institute submit with confidence, that the course they recommend to the consideration of the Town Council, in addition to its other advantages and economies, would tend, both directly and indirectly, to the improvement of the architecture of the city.

Not only within the membership of this Institute, but also outside it, among architects of the city and others, there is a large fund of architectural ability and experience. The Council of the Institute respectfully ask the Town Council to consider how far this ability should be made available on behalf of the community under their charge.

In conclusion, the Council of the Institute desire to say that they are not impelled by any merely selfish or narrow motive, but that they ask for the consideration of a question of public policy on which they believe themselves to be entitled to express an opinion.—We have the honour to be, &c.

T. L. WATSON, President.

JOHN JAS. BURNET, Vice-President.

ALEXANDER PETRIE, Treasurer.

C. J. MACLEAN, Secretary.

PUBLIC BUILDINGS IN FRANCE UNDER THE FIRST EMPIRE.

(Concluded from page 354.)

272. **Bank of France at the Hôtel Toulouse.** Imperial Printing Office at the Hôtel Soubise.—Archives at the Hôtel Soubise, Palace Cardinal, Exchange and Tribunal of Commerce at Fides St. Thomas, Quay of the Military School. Buildings of the hospital abutting on the river to be demolished, March 14, 1808.

A decree made by His Majesty at the Palace of the Tuileries on March 6, 1808, contains the following enactments:—(1) The department of the registry and public lands is authorised to cede the Hôtel de Toulouse and its dependencies to the Bank of France. (2) This cession will be conditional

on the Bank of France paying a sum of two millions (80,000*l.*) to the Sinking Fund, one million before April 1 next, and one million before January 1, 1809. (3) The Hôtel Soubise and Palace Cardinal will be purchased by the Finance Minister and added to the public lands by a payment of 690,000 francs (27,600*l.*). This sum will be paid out of the first million advanced by the Bank of France. (4) The balance of 310,000 francs (12,400*l.*) out of the first million advanced by the Bank of France will be placed at the disposition of the Minister of the Interior, for the repair of the Hôtel Soubise and the Palace Cardinal, and the removal and installation of the Imperial Printing Office in one of these palaces. (5) The whole of the archives in Paris of every description are to be lodged in the palace which is not occupied by the Imperial Printing Office. (6) The second million advanced by the Bank will be devoted to the construction of a palace for the Exchange and Tribunal of Commerce on the site of Filles St. Thomas. The balance of the cost of this palace to be defrayed by the city of Paris. A further decree, dated Tuileries, March 11, 1808, contains the following provisions:—(1) An embankment is to be formed from the Pont de Concord to the Military School. The works are to be begun this season and are to be finished in six years. (2) The Quay Napoléon is to be continued, and the buildings of the Hôtel Dieu abutting on the river demolished.

273. **First Stone of the Exchange at Filles St. Thomas** (March 19, 1808).—On the 24th instant, the Minister of the Interior will solemnly lay the first stone of the building to be erected on the site of the Filles St. Thomas. The plan of the building for the Exchange and Tribunal of Commerce is a long oblong. The building will be dignified but simple in style. The only ornament on the exterior will be a series of sculptured medallions representing the moneys of Europe. The building will be surrounded by an Ionic portico which will serve as a promenade during the winter, and will be very similar in size to the galleries of the Palais Royal. On three sides of the palace trees will be planted in rows (*en quinconce*), which will shade the promenade in the summer. The principal front towards the Rue Vivienne will have an entrance doorway and a wide staircase leading to the principal hall of the Exchange. The plan is by M. Brongniard, who, with M. Cretel, the minister, will lay the first stone on March 24, 1808. [The building, which was inaugurated and opened on November 4, 1826, after being eighteen years building, cost 8,000,000 francs (320,000*l.*).] On January 1, 1809, M. Brongniard arranged to place twenty columns at the sides instead of eighteen, in order to get a vestibule two bays wide on the principal front. The intercolumniation is 11 feet between the centres of the columns. According to the model exhibited at the Salon in October, 1808, M. Brongniard, architect, M. Gisors, surveyor (*contrôleur*), M. Dords, clerk of the works (*inspecteur*), the architect's estimate is 2,200,000 francs (88,000*l.*), the superficial area of the building is 975 toises, which makes the cost 2,300 francs a toise superficial (or about 47*s.* a foot super). The St. Petersburg Exchange, by M. Thomas de Thonon, cost 7,500,000 francs (300,000*l.*) in 1816.

Works for the Season of 1808 (April 11, 1808).—The commencement of the season has been signalled by a resumption of the great works. Scaffolding has been erected to the triumphal arch of the Carrousel for the purpose of completing it. The Tuileries apartments are to be rearranged and decorated on a new plan. The Hôtel de Brionne will be pulled down for the purpose of erecting the grand north gallery, which will form a pendant to the south gallery. A portion of the pavement of the Place du Carrousel has been taken up and excavations are begun for the foundations. The court of the Louvre is well advanced, the four vestibules are being completed, and the carving (*ravalement*) of the east front has been commenced. The quay has been raised to the level of the Pont des Arts, from the designs of M. Fontaine, architect to the Emperor. The arch of the Etoile, now without columns and diminished in size, is progressing rapidly under MM. Chalgrin and Raymond. The Column of Austerlitz, Place Vendôme, by M. Gondouin, only wants the bronze ornaments, which are being proceeded with with activity. M. Delaunoy is carrying out the foundations of the Granaries of Abundance at the Arsenal and arranging the Bank of France at the Hôtel Penthièvre. M. Celerier is finishing the restoration of St. Denis and is superintending the archives at the Hôtel Soubise. M. Courtepée is arranging the Imperial Printing Office at the Palais Cardinal. M. Brongniard laid the first stone of the Exchange on the site of the Filles St. Thomas. It is proposed to erect a palace for the Academy of Fine Arts on the Quay Bonaparte, from the designs of M. Vaudoyer. The fountain of the Cordeliers, by M. Gondouin, is in use; several others by M. Bralle are finished and some are unfinished. The Pont St. Michel has been cleared of the houses, the abutments (*pilots*) of the Quay Napoléon are being built, and the Rue de la Bucherie and the Rue de la Hachette will be converted into a quay, which will add to the beauty and salubrity of the city. The Madeleine, by M. Vignon, has been decided on, after undergoing several modifications, and will be carried out. The peristyle of the

palace of the Corps Législatif, by M. Poyet, indicates already the proportions of the pediment with which it will be finished. MM. Viel and Clavareau are arranging new hospital wards to replace the buildings of the Hôtel Dieu, which are to be removed. The restoration of the Porte St. Denis has been suspended, owing to the death of the architect, M. Legrand, and the severity of the winter, but it will shortly be resumed (*Annales de l'Architecture*, &c.).

Gallery of the Louvre (April 13, 1808).—The new gallery of the Louvre has been commenced, of a greater depth than the gallery next the river. The foundations of the portion A are already in, the stone piers are out of the ground and the podium of the order is going on; it is about 20 toises* long. The portion B does not connect with the portion A, on account of the Hôtel de Brionne, D, which is not yet pulled down. The portion B is hoarded in and the excavations are being carried as far as the Rue St. Nicaise; it is about 30 toises long. The gallery A, B, C, including the return E, is about 260 toises long. It is estimated that the buildings will cost 50,000 francs (2,000*l.*) a running toise (or 328*l.* a foot), so that the completion will probably cost about 13,000,000 francs (520,000*l.*). The triumphal arch F, below the opening into the Rue Imperial G, H, comes out badly, inasmuch from the gate of the Louvre only the north angle can be seen. It should have been placed on a straight line G, as proposed by M. Coussin in his design for an orangery—a design which was very ingenious, inexpensive and well arranged. This line is shown on the plan for the embellishment of the Tuileries by MM. Fontaine and Gravé. How is it that the architect has deviated from his first design?

282. **Ancient Amphitheatre at Nice** (April 3, 1808).—Nice: April 3.—“We have here, in the Cimiez district, a Roman amphitheatre which attracts the curiosity of travellers. This monument of antiquity, however, which ought to have been preserved with the greatest care, has been so much neglected that the steps are sunk in the ground, and the whole is nothing more than a shapeless mass of ancient buildings interspersed with modern erections. The present owner, recognising the wrong done by the negligence of his predecessors, has endeavoured to repair the wrong, and by dint of care and labour has uncovered very nearly the whole area of the ancient edifice, which in many parts is well preserved; he has pulled down what obstructed the view of other portions and has enclosed the whole with a wall. These attentions have already received a portion of the recompense they deserve in a large number of medals and curiosities which the excavations have yielded to the owner.”

284. **Versailles, Estimate** (April 28, 1808).—M. Gondouin has been engaged during the last fifteen months, with M. Quin and several measuring surveyors, on the estimate for the restoration of Versailles. He went in October 1807 to Fontainebleau to see the Emperor, who wished to see the estimate. On seeing M. Gondouin, the Emperor spoke to him in Arabic. The architect replied, “Sire, if your Majesty speaks German I cannot answer you.” “It is not German,” said the Emperor to M. Fontaine, architect, and Marshal Duroc, who were there. “I said in Arabic that you were come to ask for money.” The Emperor was engaged with M. Gondouin for three hours on this estimate, which amounts to 30,000,000 francs (1,200,000*l.*). In April 1808 the water will be let into the Grand Canal. M. Trepsat, architect, asserts that it will hold water without repair, which is doubtful.

288. **Halle aux Blés** (June 1, 1808).—The Minister of the Interior, always anxious to encourage or usefully employ artists who display real talent, has commissioned the architect Belanger to restore the cupola of the Corn Market after his designs in cast and wrought-iron, covered with copper. This conservative method, which has not hitherto been employed by any nation for such large buildings, combines economy of construction and maintenance, stability, taste and convenience. M. Belanger has been long celebrated for the talent, celerity and good taste which distinguishes his buildings. He erected the Casino at Bagatelle in sixty-four days; stables at Choilly for 300 horses and 150 grooms in fourteen days; he designed the fine saloon of the Château of Maison, the fire brigade stations, &c. This artist has contributed so much to raise the taste and style of decoration, that he may be regarded as the author of the revolution which has taken place in the last thirty years in interior arrangements, furniture, as well as flower gardens and landscape gardening, for which he has been frequently employed since his return from England. In February, 1835, it was discovered that the walls, which had not been built to carry the roofing of the courtyard, which is 121 feet diameter, were crushing under the weight of the iron dome resting upon them.

290. **Gallery of the Louvre** (June 1, 1808).—The galleries of the Louvre next the river had merely casement doorways (*croisées avec des chaussees*) in the portion adorned with the grand Corinthian order. In 1760 M. de Marigny, superin-

* A toise is 1.947 mètres.

tendent of buildings, being desirous of establishing a communication between the Carrousel and the quay, caused three square-headed openings (*en plate-bande*) to be formed by M. Gabriel, architect, which were called *Guichet Marigny* and afterwards *Guichet Neuf*. In 1802, when Bonaparte was First Consul, he had a wicket formed by Fontaine, the architect, for his private use next the palace. The architect made it similar to the corresponding arch next the Carrousel.

In 1804 M. Raymond, the architect to the Louvre, whose jurisdiction extends up to the *Guichet Marigny*, opened up the first guichet to the east adjoining the *Guichet Marigny*. He made it an arch, but 6 centimètres higher than the corresponding one on the Carrousel side.

In 1806, Bonaparte having become Emperor, ordered the opening of twenty-five wickets under the large pediment-like gallery, and Fontaine, who was then the architect of the Louvre and the Tuilleries, was given the work. He made the first thirteen to the south of the *Guichet Marigny* similar to the first opened by him in 1802. When he came to the three *Guichets Marigny* he did not touch them, but when he came to the guichet by M. Raymond, which by mistake was made 6 centimètres higher than his own and those on the opposite side, carried on this mistake in the next twelve arcades as far as the *Guichet St. Nicaise*, so that these latter, which are at a lower level than those near the château, appear long, narrow and entirely different to the first thirteen arcades. There are therefore in this front, which is already full of defects, thirteen short arcades, then three wickets of unequal width with square heads (*en plates-bandes carrées*), then twelve very high arches. What an eyesore.

In 1808 the underpinning of the gallery of the museum, executed in 1778 by M. Brebion, having injured the trusses of the roof, measures are being taken to secure the trusses without removing them from their place.

Eight window openings are being formed at the end near the grand saloon, four on the south and four on the north.

At the same time the carving (*ravalement*) of the whole of the masonry of this gallery, to make it match with the Louvre, which is being scraped like new, is going on.

290. **Monument to M. Dubelley** (June 18, 1808).—The Emperor sends orders from Bayonne that Cardinal Dubelley, who died on June 13, 1808, aged 98, shall be interred in the metropolitan church of Paris, and that a monument be erected in memory of this worthy prelate in the same church.

294. **Ecouen** (July 6, 1808).—The palace of Ecouen has been assigned by His Majesty for an Imperial school, to be called after him, for young girls, daughters of members of the Legion of Honour, under the direction of Mdme. Campan. This pretty building, by J. Bullant and P. L. Delorme, was sacked during the Revolution. The restoration has been begun by M. Peyre's nephew. I visited the palace to-day with the latter, and found it in very good condition, and inhabited already by 200 boarders. The restoration will cost about a million francs (40,000*l.*).

295. **Sorbonne** (July 1, 1808).—M. Beaumont is commissioned to restore the church of the Sorbonne, which is now a ruin, through the inconsiderate alterations carried out in 1798 by M. Hubert, to convert it into a normal school.

Arc du Carrousel, Statue of the Emperor (July 22, 1808).—The statue of the Emperor was hoisted yesterday on to the Arc de Triomphe at the Carrousel. The statue, which is of lead gilt, as are also the two Victories holding on each side the reins of the horses, will be placed on the chariot.

Louvre. Progress of the Works (August 4, 1808).—The works to the Louvre are being pushed forward with considerable activity. The southern portion of the superb colonnade has been completely restored, the other portion will be certainly done before the bad weather. Doorways have been formed where Perrault had constructed niches for receiving statues. The entrance vestibule is adorned with fluted columns, three parts engaged in the walls; the soffits of the arches are ornamented with caissons and rosettes. Right and left are vast galleries vaulted in stone for the reception of antique sculpture. At the extremity of these galleries are two magnificent stone staircases. These staircases have turned out well (they are engraved in Perrault's design), and are constructed in the north and south angles of the colonnade to give access to the upper floors. Above the entrance doors two magnificent fragments of sculpture have been placed, which decorated the attics of the south face of the courtyard. The peristyles next the Rue du Coy and the Place du Muséum have been completely restored. They are separated by fluted columns supporting the ribs of the vaults. Above the cornice between the architraves are carved French eagles, of which the heads and the tips of the wings are all that can be seen. The Hall of Antiques, where the Institute formerly held its public meetings, has been almost entirely repaired. All the soffits (*arcs doubleaux*) have been ornamented with rich sculpture after J. Goujon. The two largest are divided into panels enriched with sporting subjects, with heads of hunting dogs above. At the springing of the vault are stags' heads. On the keystone are two figures of

Diana, one of which is copied from the beautiful statue of the goddess now in the Museum, formerly at Versailles, and the other represents the goddess going hunting. At the end of the saloon is a chimney-piece adorned with two fine statues, also by Goujon, representing Force and Justice. The main building next the Seine being larger than the others, it was necessary to divide it longitudinally into two portions, but as each of these portions would have been too narrow and mean if they had been equally divided, one was made larger than the other, but they are both well proportioned. It is not yet decided how they will be decorated. Scaffolding has been erected to complete the sculpture on the north and south fronts in the inside.

Sanitation of Hospitals and Infirmarys.

SIR,—We observe in your article on the "Sanitation of Hospitals and Infirmarys," in your issue of the 7th inst., you state that all refuse of every kind should be burnt in a properly constructed furnace, so constructed that the gases resulting from combustion are destroyed or decomposed before reaching the smoke-flue. We beg to call your attention to our Dr. Sergeant's patent incinerator, which is specially designed for this purpose. We enclose descriptive circular, and among the places where this apparatus has been adopted we may mention the West Riding Asylum, Wakefield; Winter Street Hospital, Sheffield; Bolton Rural Sanitary Authority, Birmingham Union Workhouse, Eastbourne Corporation, Prescott Union Rural Sanitary Authority, Ladywell Sanatorium, Salford; Jersey States, London Hospital, Hampstead, Knightswood Joint Fever Hospital, Partick, near Glasgow; Cardiff Infectious Hospital, Tooting Hospital (Metropolitan Asylums Board), Guernsey, Farnworth, near Bolton; Western Infirmary, Glasgow; Londonderry, Dundee, City Smallpox Hospital, Edinburgh; Birmingham Infectious Diseases Hospital, Govan Hospital, near Glasgow; County Council of Haddingtonshire, Newington Vestry, Monte Video and Trinidad.—Yours faithfully,

Manlove, Alliott & Co., Limited.

THOS. CANTRELL, Secretary.

Nottingham: December 10, 1894.

GENERAL.

The County Council have decided that the Liberator buildings on the Victoria Embankment are unsuitable for the purposes of a county hall.

Mr. J. M. Forrester has presented to the Corporation Galleries, Glasgow, a bronze group, *The Bull Fight*, by the Belgian sculptor, M. Clesinger.

A Theatre is about to be erected in Longton from designs by Mr. F. Matcham. The plans have been passed, subject to the drains being constructed to the satisfaction of the surveyor; to the openings in the proscenium wall being closed by wrought-iron doors; to the proscenium opening being provided with a fire-resisting screen, and to the gas-meters and heating apparatus being placed in properly-ventilated chambers of fireproof construction.

Mr. W. Renison, of Glasgow, has opened a studio for painting in Dublin.

A German Church in the Rue Blanche, Paris, has been opened. It was designed by M. Niemans.

Rev. H. J. Lawlor, F.S.A.Scot., at the meeting of the Society of Antiquaries of Scotland, described the contents of a ninth-century manuscript of the Four Gospels, preserved in Trinity College, Dublin, known as the Book of Mulling.

Mr. Wm. Dickie gave an address before the members of the Sheffield Society of Architects on Tuesday, his subject being "Wentworth House."

Mr. Henry Southall, F.R.Met.Soc., will, at the meeting of the Royal Meteorological Society on Wednesday, the 19th inst., read a paper entitled "Rainfall and Floods in the Catchment Basins of the Severn, Wye and Usk, November 1894."

General J. Michael, C.S.I., will lecture on "Forestry" at the meeting of the Society of Arts on Wednesday, the 19th inst.

An Exhibition of Scotch Art is announced at St. George's Gallery, 14 Grafton Street, W., the private view being held to-morrow (Saturday).

The Architect.

THE WEEK.

THERE are so few of WREN's works outside the Metropolis, the destruction of the Winchester Barracks on Wednesday morning is more of a loss in an architectural sense than could be any of the modern structures for military purposes. The Winchester buildings, it need hardly be said, were not planned as barracks. CHARLES II. admired the old city, which had suffered grievously for the royal cause, and, as he imagined he could be a controlling power at Portsmouth, he resolved to erect a palace at Winchester. The works were commenced in May 1683 from WREN's designs. The project was ambitious. There was to be a quadrangular group measuring 326 feet by 216 feet, with a cupola so lofty as to be seen from the sea. In addition, there was a broad street, with fine dwellings leading from the palace to the cathedral. A large area of ground was purchased for parks and gardens, of which a careful terrier in WREN's handwriting is still preserved in the library of All Souls, Oxford. The grounds were to be laid out by JOHN EVELYN. A river was also to be excavated, which would enable small vessels to pass to and from the sea. The "carcase" of the palace was completed and roofed, when operations were suspended by the death of the King. JAMES II. would not meddle with the works, and WILLIAM III. was no less indifferent. Queen ANNE was desirous to complete the building as a residence for her husband, but his death again stopped the works. The palace was useless until somebody proposed to turn it into an enclosure for prisoners of war, and during the continental wars it contained many inmates. Subsequently it was converted into barracks. That buildings in which wood was so largely employed should be used for many years in housing a large number of soldiers is evidence of the incapacity of the technical advisers of the War Office. More than an hour elapsed on Wednesday before a supply of water was available, and the old timber was meanwhile vanishing. Nearly the whole of the parts used for barracks are destroyed, as well as the stores. The fire arose while the men were in bed, and if it were not for their perfect discipline the consequences must have been terrible.

A MEETING of the Glasgow Architectural Association was held on Monday evening, when Mr. T. L. WATSON delivered a lecture on "The Thirteenth and Fourteenth Centuries in Italy." Some of the varieties of Gothic architecture that prevailed in the different divisions of the country were explained. The influence of the classical art of antiquity was felt throughout the whole Gothic period, and was seen in the general effect of breadth, in the horizontal treatment and the flat surfaces, as opposed to the vertical treatment and the deeply recessed openings and mouldings of Northern Gothic. It was also visible in the indiscriminate mingling of round and pointed arches; in the fondness for the single round pillar or shaft in place of the clustered column; and for the tapered form of pillar instead of the cylindrical form almost invariable in the North. There was a certain defect of the constructive sense seen in the prevalence of the iron tie rod to hold the arches together and in the overloading of slender pillars, apparently quite unequal to their task. The fact that they are still standing after 500 years is a proof that they are, in reality, strong enough, and something must be allowed for the known hardness and strength of marble, as compared with the building stones employed in the North. After every allowance is made, however, it has to be admitted that the apparent weakness of many of their buildings is a characteristic and serious defect. A third characteristic was the great wealth of colour produced by various marbles, brick and terra-cotta, and by mosaics and fresco paintings. Many of the painters were architects also, and even those who were not showed an intimate knowledge of architecture. The paintings were really allied to the buildings, and not merely applied. The architecture painted as accessory to the figures was in harmony with the lines of the building, and the figure subjects also had the

architectural qualities of symmetry, restraint and repose. The architecture, painting and sculpture of the Renaissance were then touched upon, and the same qualities were illustrated up to the middle of the sixteenth century, after which there was rapid deterioration.

By the death of Mr. ARTHUR COWPER RANYARD, M.A., the editor of *Knowledge*, on the 14th inst., the London County Council loses one of its most estimable as well as one of its most active and intelligent members. He was a member of the corporate property committee, the parliamentary committee and the Building Act committee, and took great interest in the preparation of the London Building Act, 1894. Mr. RANYARD was a barrister, but his tastes were rather for scientific subjects than legal matters, his favourite pursuit being the study of astronomy, in which he took great interest, and on which he published several treatises. Mr. RANYARD was a bencher of Lincoln's Inn, and in that capacity, as our readers will remember, was largely instrumental in preserving Lincoln's Inn Gateway, Chancery Lane, from the attacks of Lord GRIMTHORPE, who was anxious to pull it down.

COMMUNICATIONS received from the representatives of the Palestine Exploration Fund in Jerusalem announce the discovery of a remarkable specimen of Pagan inscription in that city. The iron-bound door of Neby Daûd, which had remained open against the wall for a number of years, was recently blown down during a severe storm, and on one of the stones behind it an inscription was perceived. It is a votive tablet to JUPITER on behalf of the welfare and greatness of the Emperor TRAJAN and the Roman people, erected by the Third Legion, which takes us back to the interval between the destruction by TITUS and the founding of Ælia Capitolina. The stone was partly covered with plaster, and may have been entirely concealed when the door was last opened and shut, which may account for its being unnoticed. It is built into the modern wall about 15 feet above the ground. Roman inscriptions are very rare in Jerusalem, and this discovery is therefore of exceptional interest.

AMONG the intellectual enjoyments of the French capital there was until recently hardly one that could compare with what was obtainable every Sunday in the garden and rooms in the Rue de Chateaubriand which belonged to the venerable JEAN GIGOUX. The painter had exhibited at the Salon from 1831 until 1894, and it might be said that all his competitors in that long period were his friends. It seemed impossible for JEAN GIGOUX to make an enemy. Representatives of the numerous schools looked on him as a sort of arbiter. Accordingly on every Sunday it was possible to meet painters, sculptors and architects in his modest house, who by no persuasion could be brought together elsewhere. It must not be supposed that the host was a gushing nonentity who sided with all men because he was without ideas of his own. The fact was JEAN GIGOUX was more remarkable for his character than for his ability as a painter. He was a man that could be trusted, for no temptation could make him deviate from the course he believed to be right. In a country where there is so much shifting, it was a gratification to find at least one man who was always consistent. No wonder therefore that so many friends hoped to see his works in the collection of living artists in the next international exhibition, and to celebrate his centenary in 1906. His death on the 11th inst. makes such a consummation impossible. Englishmen have reason to regret his loss. They found the warmest of welcomes from him, and he was glad to exhibit to them the pictures by their countrymen which he possessed. For JEAN GIGOUX was for years the only artist in France who believed in the English school, and if it is now appreciated we may thank him as one of the causes. During the greater part of his career the artist produced religious and historical pictures. Of late years he restricted himself to portraiture. His works are not much known out of France, but it is possible to obtain examples of his vigorous book illustrations, such as the *Gil Blas*, which he designed in his youth.

OLD LONDON STREETS AND HOUSES.

IF we could imagine the shade of one of the citizens of London who was ruled by a Tudor or Stuart king revisiting his old haunts, he would be as much surprised by the general administration as by the growth of the streets. There are so many complaints heard about the mismanagement of vestries and other local authorities, and especially during the past election week, it might be supposed that by the ancient charters the amenity of the Metropolis was one of the birthrights of the inhabitants. It is not remembered that the control of streets and buildings does not date from a remote age. If an Act were passed in the early days of the forthcoming session enacting as an urgent affair that every house in the Metropolis above a certain value should exhibit sculptured decoration on the front, it would not excite more amazement than was caused by the Paving Acts of HENRY VIII. In 1533 it was declared that the street between Charing Cross and Strand Cross should be paved at the cost of the owners of the adjoining lands, who were afterwards to keep the way in repair. Neglect was to be punished by the payment of twelpence to the king for every square yard that was not kept in a proper condition. A similar statute was issued in the following year for Holborn and Southwark. The paving thus became a State affair and defaulters had to reckon with His Majesty. If that arrangement were not made it may be doubted whether any municipal authority would have the strength to enforce the carrying out of the law. The difficulty of compelling people to co-operate for the improvement of streets is evident when we find that HENRY VIII. began tentatively with outlying portions of London. It was not until 1540 that a similar enactment came out which specified the street between Aldgate and Whitechapel Church, Chancery Lane, Gray's Inn Lane, Fetter Lane and the way between Holborn Bars and High Holborn. The penalty for not observing the statute was, moreover, reduced to sixpence a square yard. Three years afterwards other parts were comprised in the new measures, such as Whitecross Street, Grub Street, Long Lane, St. John's Street, the streets behind St. Clement's Church without Temple Bar, part of Westminster, &c. There was another change in the fines, for they were to be fixed at the discretion of the justices. In cases where the paving was executed by a tenant he was allowed to deduct the expenses from the rent paid to the lessor, unless there was an agreement to the contrary.

It was the duty of the mayor, aldermen and justices in the City and the justices of the peace in Middlesex to inquire into defaults, and any of them who was remiss must forfeit 5*l*. In the City all fines obtained under the statutes could be applied to the use of the mayor and commonalty. Under ELIZABETH the fines were increased to 3*s*. 4*d*. for every square yard that was not paved or repaired. A fine of 6*s*. 8*d*. per pole was also to be inflicted on those owners who neglected to scour and cleanse the ditch on the north side of Hog Lane.

It is evident, therefore, that under the Tudors the duty of keeping streets in what was then considered a proper condition was cast entirely on the individuals who owned the land on both sides. As a consequence they were generally so badly paved as to amaze foreign visitors. On paper it was easy to fix fines for every breach of the statutes about paving, but the citizens of London were never partial to legislation which encouraged informers and turned neighbours into enemies. The cleansing of the streets could not be otherwise than irregular, for it was the custom to cast the responsibility on some unlucky citizen who commonly evaded the duty by means of bribes, and the parish officers and labourers executed the work with as much ease to themselves as the circumstances allowed. In the time of CHARLES II. it was decreed that in every parish two tradesmen were to be chosen, who were to be the scavengers for the ensuing year, but they could refuse office by paying 20*l*.

The regulations concerning houses were more lax than those about streets and highways. An Englishman's house was his castle, and he might do much to make it a source of danger to his neighbours without any interference on the part of authority. By the ancient "Assize of Building" it was open to a citizen to demand that the mayor and a jury of twelve men should enforce certain regulations about

building which would have aided in diminishing the risks of fire, but apparently few cared to assert their rights in that way. Timber was the favourite material in London. Even when the Great Fire of 1666 had demonstrated its danger, we find the astute Sir WILLIAM PENN proposing to SAMUEL PEPYS that they should invest largely in Scotch timber, as it would be needed for the rebuilding of London. Apparently it was not anticipated by the comptroller that any changes in the mode of building would be demanded. A few years before the Fire, the Lord Mayor "a talking, bragging, baffle-headed fellow," had told PEPYS that he was resolved to pull down the shops in the City and to make a great thoroughfare; but so despotic an exercise of power did not appear to be feasible.

From occasional entries in PEPYS's "Diary," it is plain that he could not at first believe that London was to be laid out on a matured plan. He was told that the few churches selected for rebuilding were "not chosen with regard to the convenience of the City; they stand a great many in a cluster about Cornhill; but all of them are either in the gift of the Lord Archbishop, or Bishop of London, or Lord Chancellor, or gift of the City." He adds, "Thus all things, even to the building of churches, are done in this world." Interests of different sorts were an obstacle to the laying-out of the City in a convenient way. CHARLES II. considered that the proposal of Colonel BIRCH was the most prudent, which was that trustees or commissioners should be appointed, and for all the ground to be sold by them, preference being given to the former owners, instead of arranging for the disposal of the sites in patches. WREN's plan would appear to correspond with that proposal, but neither the Government nor the citizens could realise the necessity of such a disposal of what SPRAT called "the most advantageous seat of all Europe for trade or command."

The new city was as near as practicable on the same lines as the old. Some streets were enlarged, such as Fleet Street, Thames Street, Paternoster Row, &c., and the mayor, aldermen and commoners were permitted to make wider any passages that were less than 14 feet across, but the only new street mentioned in 19 Car. II. chap. 3, is one from the Guildhall to Cheapside, and which in consequence retains the dignity of being designated King Street. There is an anecdote recorded by PEPYS which reveals that the modern way of making the most out of an improvement is not novel. On December 3, 1667, he writes:—"Sir RICHARD FORD tells me, speaking of the new street that is to be made from Guild Hall down to Cheapside, that the ground is already most of it bought. And tells me of one particular, of a man that hath a piece of ground lying in the very middle of the street, that must be; which, when the street is cut out of it, there will remain ground enough, of each side, to build a house to front the street. He demanded 700*l*. for the ground, and to be excused paying anything for the melioration of the rest of his ground that he was to keep. The Court consented to give him 700*l*. only not to abate him the consideration, which the man denied; but told them, and so they agreed, that he would excuse the City the 700*l*. that he might have the benefit of melioration without paying anything for it. So much some will get by having the City burned. Ground by this means that was not worth 4*d*. a foot before, will now, when houses are built, be worth 15*s*. a foot." In this case the betterment question was easily solved without any exchange of money between the parties.

It was not to be expected that the Building Act of 1667 should be exacting in details. A great deal was gained when it was decided that "all outsides of buildings shall be made of brick or stone, or brick and stone together, except for doorcases and window frames, the bressummers and other parts of the first storey to the front between the piers, which at the discretion of the builder may be built of oak for conveniency of shops." Bricks were in those days not easily obtained in London, and it was found necessary to introduce a clause in the Building Act, in virtue of which, in case of combination or exaction by brickmakers, tile-makers and lime-burners, the Lord Mayor and aldermen could determine the prices and wages that were to be paid. Any man who did not accept the decision of the Corporation could be sent to gaol for a month in default of paying a fine. In spite of the authority, brickmaking was not

always profitable, for JOHN EVELYN, who was one of the wisest men of the time, lost the sum of 500*l.* in a speculation to produce bricks.

The Building Act of CHARLES II. suggests by all its clauses that it owed its origin to the Great Fire of 1666. Those which have followed it likewise reveal that fire is the danger which has to be opposed, and as far back as 1136 we have evidence of the existence of a similar fear. The Act which is about to come into operation is not confined to protection against fire. The clauses relating to open spaces behind buildings, and in some cases within them, to the ventilation of staircases, the heights of habitable rooms, and the conversion into dwelling-houses of buildings that were not originally intended for dwellings, are evidence that fireproof cities are not necessarily the most perfect. The change in legislation would appear extraordinary to the shade of our ancient citizen. He would probably consider that if he and his contemporaries adopted similar precautions to those in the Act of 1894, they might have enjoyed terrestrial life much longer. But he could hardly help wondering that with all the improvements, there is not a word in the new Act which could be interpreted in favour of imparting some touch of beauty to the new buildings. Security against fire and foul air is desirable, but it would be well to be assured that less pleasing buildings than those of the time of HENRY VIII. or CHARLES II. are an impossibility in London.

RHIND LECTURES IN ARCHÆOLOGY.

IN the fourth lecture of the series on "Early Fortifications in Scotland" Dr. Christison treated of the characteristics of the forts north of the Forth. The first district he dealt with was Argyle. Not only were the forts of the Argyle mainland widely separated from those in other parts of the Highlands, but within the county itself the distribution was very peculiar. In the northern part, including the extensive districts of Morven, Ardnamurchan, Ardour, Lochiel, and even taking in Nether Lochaber, which, although in Inverness, lay on the side of the Linnhe Loch, opposite Ardour, there were but three, one of which was quite isolated at the junction of Loch Leven with the Linnhe Loch, the other two being close to the north border of the county. In the inland, central and western part of the county a district penetrated by the large salt-water lochs that branched off from the Firth of Clyde, the forts were more numerous, numbering about thirty, of which nine were clustered round the fresh-water Loch Awe. But it was on a narrow strip of land running north from the Mull of Kintyre for about eighty-five miles that the great mass of Argyle forts were concentrated. Here they numbered no less than 143, and they were all on or within a few miles of the sea, either facing the Atlantic or on the little lochs that branched off from the ocean, or on the east side of the peninsula of Kintyre. And on that peninsula it was noticeable that they were more numerous facing the stormy Atlantic than on the sheltered side that looked on the Firth of Clyde. Another remarkable point was the abrupt termination of the group at its north end by a line drawn from Loch Etive through the island of Lismore. In fact, it might be said that the forts of the West Highland seaboard almost ceased there, as from this line to Cape Wrath there were not more than twenty-four fortified structures of any kind, six of which, on or not far beyond the north border of Argyle, were forts, while all the others were either known or suspected to be brochs. The lecturer then dealt in detail with the principal forts in the Argyle district, pointing out their chief characteristics by the aid of plans, and concluding with a description of the extraordinary one on the northmost of the Garveloch Isles, properly the Garbh Eilach or rough isles. Mr. Skene considered that this was the fortress of Connal Cearnach, one of the heroes of the Ulster Picts. Turning to the forts on the Highland mainland without Argyle, he said their most striking characteristics were their scantiness and their confinement in general to a few localities widely separated from each other. There were only fifty-two ascertained forts or sites of forts in this extensive district. Of these twenty-two were concentrated near the Beaully Firth and on the Black Isle of Ross, two were on the peninsula between the Firths of Cromarty and Dornoch, five on or near the west and north coasts, and nine in Caithness, and only fourteen remained for the vast interior of the district. Of these four were grouped around Loch Ness and eight were in the Highland part of Perth, completely cut off from the other Highland groups, and directly connected with the Lowland forts of their own county. Thus but two were left for the great valleys and glens of the central and north Highlands, viz. Dunbhairdghal, in Glen Nevis, and An Dun Strathmashie, Inverness. In describing the forts of the

north-eastern counties he explained that in point of size this group was remarkable for the large proportion that entered the highest class. No less than ten out of a total of forty-seven measurable forts ranked as large, compared with only two out of forty-eight in the Highland mainland, and none out of 167 in Argyle. The largest were the Brown and White Caterthuns, in Forfarshire, which were about 1,100 by 1,000 feet, and 1,260 by 800 feet respectively, and Burghead, on the Moray Firth, which was about 1,130 by 700 feet. In conclusion, Dr. Christison dealt with the forts in Fife, Kinross and Clackmannan, which did not exceed twenty in number. As to their distribution they seemed to avoid the coast, but perhaps the numerous fishing villages for which Fife was famous might have obliterated them there. The size in this group was a good average. None were found in the smallest class, eleven were moderate sized and one was large.

Dr. Christison, in the fifth lecture on early Scottish fortifications, dealt especially with the subject of the place-names in connection with forts. He considered the subject under the heads of the generic names by which the Scottish forts were or might have been designated. These were dùn, rath, car, lis and burh. The word dùn was by far the most important, and was almost the universal generic name for the forts in the Highlands. At the same time it was not to be concluded that wherever the word was met with a fort had existed, for dùn had several applications, its primitive meaning being a mound of any kind. About 110 of the Highland forts bore the generic name an dùn and nothing more; but about 260 had a specific name also. In some of these cases the specific name was descriptive or topographical. In a considerable number of cases it was personal, as Dùn Diarmaid. These names, however, were but a slender guide in determining the origin of the forts. In the Eastern and Lowland districts, in marked contrast to the universal application of the term in the Highlands, the applications of dùn to forts were very few, and in some large divisions there were scarcely any. On the other hand, in the Highlands the term was rarely applied to hills of any considerable height, while in the Lowlands it occurred in a large proportion of the very highest hills. The Scottish dùns had not been left altogether without historical testimony of their existence in the early annals, and in these there were notices of Dunolly, Dunadd, Dundurn, Dunaverty, Dunottar and Dunbarton. The term rath, according to Dr. Joyce, was applied in Ireland in general to a class of earthworks inferior in dignity to the dùns, and was very abundant there as a place-name. In Scotland the term did not seem to have been so frequently applied. He had made out under 200, a good many of which were questionable descendants of rath, and the proportion of these connected with forts was so meagre that it required some research to find them out. In the Highlands he could discover but two forts connected with rath—in Bute; and outside the Highlands there was apparently but one clear example of the root in connection with a fort—at Rait, Errol. The early annalists seldom mentioned raths in Scotland. The term lis or lios was, according to Joyce, the name of the third or smallest class of Irish forts. In Scotland the use of the term was scanty, and it did not appear to have any connection with forts. It might be questioned whether in Scotland lios ever meant fort at all. The term cathair in Ireland was appropriated to forts of stone. It might have migrated to Scotland, however, from Wales, where car, a rock, as in Ireland, appeared to be distinguished from caer, a fort. Then, the occurrence of car in England raised the question whether it might not have had a Teutonic origin; so that in Scotland it might have come from Irish, Welsh, or Teutonic sources. No doubt, however, the great majority of the Scottish names with the prefix car were of Celtic descent, but whether from the word signifying rock or from the word signifying fort, it was difficult to determine. The total number of place-names beginning with car in Scotland could not be very great. There were 150 in the county directory, of which twenty were in the Highlands and about a dozen were all he could ascertain to be in any way connected with forts. The burghs of Scotland might be descended from the Saxon burh or the Scandinavian borg.

In the concluding lecture he dealt with the characteristics of forts south of the Forth. Treating first of the Galloway and south-west coast groups, Dr. Christison noted their resemblance to the Argyll group in their low elevation, small size and proximity to the sea. No broch had been found in this district, and five vitrified forts had been claimed for it, as the lecturer thought, on meagre authority. Kirkcudbright, however, was the centre of the motes. In Dumfries, with its 225 forts, they were distributed as if to avoid the sea, and the elevation was greater. Neither brochs nor vitrified forts were claimed for the county, but rectilinear works and motes were pretty common. In Peebles and Upper Lanark the forts stood high and were pretty large in size. No brochs or vitrified forts had been discovered, and motes were unknown in Peebles, though a few had been claimed for Lanark. In the district between the Lammermoors and the Cheviots forts were numerous, especially on the side of the Cheviots, in Lauderdale, and up

the Gala Water. A couple of brochs and a couple of large rectilinear camps had also been noted. Between the Lammermoors and the Pentlands and the Forth there were upwards of forty forts and a few rectangular works, but neither brochs nor vitrified forts. In concluding the lecturer said he trusted it had been proved to their satisfaction that the subject of early Scottish fortifications had been wisely chosen by the Council of the Society of Antiquaries. It had been his aim to present carefully-ascertained facts rather than indulge in hazardous theories, and thus adopt a truly scientific method, and if they reflected that the subject, naturally an obscure one, was attacked for the first time scientifically, it would not seem surprising that he had been busied in laying a good foundation for future workers rather than in rearing a rickety and premature superstructure of his own.

SHEFFIELD SOCIETY OF ARCHITECTS.

THE monthly meeting of this Society, referred to last week, was held on Tuesday evening, the 11th inst., at the School of Art. In the absence of the President at the commencement of the meeting, the chair was occupied by Mr. F. Fowler, the treasurer, there being also present Messrs. C. J. Innocent, hon. sec., R. W. Fowler, J. Smith, T. Winder, J. B. Mitchell-Withers, J. E. Benton, W. C. Fenton, H. Webster, J. R. Wigfull, C. Gibson, A. J. Greenwood and many other members, and Mr. B. Bagshawe and other visitors. The following new members were elected by ballot:—Mr. George J. Gillham, Sheffield, as associate, and Mr. Thomas H. Robinson, Sheffield, as student.

The event of the evening was a lecture on "Wentworth House: historical, descriptive and illustrative, with practical observations on some materials used in the building," was given by Mr. William Dickie. The lecturer referred to the early ancestry of the Fitzwilliam family, and carefully traced the history of Wentworth Woodhouse from the middle of the sixteenth century to the present time, giving descriptions of alterations and additions at various times, dwelling upon the great work of 1741-43, with the names and interesting particulars of the various architects concerned. He then exhibited plans and elevations of the buildings, and explained in detail the dimensions, proportions and decorations of the principal apartments, showing detail drawings of the work. The drainage of the mansion, the cellar and water arrangements, and the ventilation of the main sewer were fully described. An interesting account of the mode of casting the roof lead, gathered from implements in existence at Wentworth, was given, and specimens of lead from the roofs were exhibited to show the action of various materials upon it when placed together. Samples of iron used in the work of Inigo Jones were produced, and slag, concrete and other materials.

Mr. E. M. Gibbs, president, who had arrived after the commencement of the meeting, proposed a vote of thanks to Mr. Dickie, and complimented him upon the excellent manner in which he had preserved the drawings in book folios, and thought in that respect architects generally might with advantage take a leaf out of Mr. Dickie's book. He felt sure that Wentworth would be largely visited by members of the profession if they knew how much there was to interest them. The motion was seconded by Mr. Reginald W. Fowler, and supported by Mr. B. Bagshawe (deputy coroner) and others, and carried with acclamation.

EMOTIONAL ARCHITECTURE AS COMPARED WITH CLASSICAL.*

HOW strange it seems that education, in practice, so often means suppression; that instead of leading the mind outward to the light of day it crowds things in upon it that darken and weary it. Yet evidently the true object of education, now as ever, is to develop the capabilities of the head and of the heart. He, therefore, who possesses a sound head and a responsive heart is worthy of enlightened guidance, is amenable to educational influence.

Let us now imagine a simple youth so equipped, so gifted, I am almost forced to say, an inborn poet, untalented, unschooled, and living an outdoor life. So familiarly has he fared with sunshine and air, and the living things, that they seem, as indeed they are, everyday and common to him. Yet the mere community of their lives, the similarity in the experiences of the boy, the plants and the animals in that native, simple, naïf, unsullied state that we who are perhaps unduly artificial call by contrast natural—this state has drawn him very near to them all.

Breathing the same air as they, maturing in the same glowing sunshine, sustained by the same satisfying moisture, he

and they expand side by side, defining themselves intimately to each other; and the boy, growing always, after a while feels himself to be not only with them, but of them. His is a brotherhood with the trees; a wistful eye he softens to the flowers; he has a comely friendship for them all.

He knows that the young leaves love the dew; that the tendril reaches quietly for the twig it may cling to. He has seen the fern unfolding its brown spiral to become anon green and regular. He has splashed knee-deep in the marsh; he knows the dank fragrance very well; he parts his friends the rushes to make a way for his eyes that seek what they may devour—his eyes with a keen and endless appetite. His hands touch the warmish water—sniffing the active air, he lives as only a boy can live—his lively sensibilities always in physical touch with his surroundings, in the full and irrepressible enjoyment of his five senses.

These five senses, and they only, stand between him and nature. It is they that interpret her affection, and the ready language that they deal in keeps him in such a natural sympathy, so well in touch, so intimately at ease, that he does not for a moment realise that he is then and there doing that which education so-called, once having made inoperative in him, he will in after years, poet though he be, reacquire only with the utmost difficulty the power to do.

This something that he is doing, and the physical and psychic state that it implies, we call "touch," meaning not the touch of the painter, not the touch of the sculptor, not the mechanical and technical touch of the fingers only, nor quite their negligent contact with things, but the exquisite touch of the sensibilities, the warm physical touch of the body, the touch of a sound head and a responsive heart, the touch of the native one, the poet, out of doors, in spontaneous communion with nature.

So has our youngster started easily and naturally, all alone without premeditation or guidance, upon the road to knowledge, to leadership and power. For this sensibility, this healthfulness, this touch, this directness of apprehension, this natural clearness of eyesight that is his is the first essential prerequisite in the early analytical strivings of the mind. It is that perfect concrete analysis by the senses and the sympathies which serves as a basis for the abstract analysis of the intellect.

Let us not forget our little man, for he is to companion me in spirit through this discourse. I believe he exists somewhere, has in his breast the true architectural afflatus, and will some day come forth the Messiah of our art. For he has that early and sure understanding by the eyes that will survive the future uncertainties of the brain. He has that exalted animal sense which alone can discern the pathway to hidden knowledge, that acute and instant scent in matters objective leading to matters subjective that we call intuition.

This physical endowment, this sense of touch is decidedly, wherever found, a generous gift of nature; but it is potent for results in so far only as it is urged into sustained and decisive action by a certain appetite or desire.

This desire, this insistence, this urgency which will not be denied; this uncomfortable hunger, this uneasy searching, this profound discontent, oh! so deep; this cry for more, this appetite, this yearning ever unsatisfied is not of the body alone but of the soul, and always and everywhere, in all times and in all places, high or low, wherever found, it is the dominant characteristic of man's eminence in nature—it is the justification of the eminence of a few men among their fellows.

For appetite, in a state of nature, implies not only a keen desire and a search for the food wanted, but, as well, a rejection of all else, thus insuring a wonderful singleness of purpose, a concentration of action, a definiteness of end in the selection of that nourishment of the faculties which, when assimilated, is to become in turn thought and expression through the agency of a second desire equally great, equally intense, equally insistent, namely, the desire to act. This desire to act we call imagination.

These two great desires, which are in essence the desire to absorb and the desire to emit, the desire to know and the desire to test, the desire to hear and the desire to utter, are the basis not only of a true and effective education, not only are they the wholesome body and the enchanting voice of art, but they are greater than these, for they are the animating quality of that higher purpose and significance of art that we call poetry.

Now, the desire to act that in due time follows upon nutrition can assert itself tangibly and fully only by means of three agencies, the which, by virtue of its life-giving qualities, this nutritive power has called into being. All three of them must co-operate in turn in order to produce a fully rounded result. They are, first, the imagination, which is the very beginning of action because it is a sympathy that lives both in our senses and our intellect—the flash between the past and the future, the middle link in that living chain or sequence leading from nature unto art, and that lies deep down in the emotions and the will. It is this divine faculty which, in an illumined instant, in that supreme moment when ideas are born, reveals the end with the beginning, and liberates, as an offspring of

* A paper read by Mr. Louis H. Sullivan at the Convention of the American Institute of Architects.

man, that which before had rested, perhaps for untold centuries, dormant but potential in the inmost heart of nature. This is the supreme crisis. This is the summit of the soul, the fertile touch of the spirit, the smile of nature's bounty—the moment of inspiration. All else is from this moment on a foregone conclusion, an absolute certainty to the master-mind; a task surely but not a doubt.

Second in this trinity comes thought, the faculty that doubts and inquires, that recognises time and space and the material limitations, that slowly systemises, that works by small increments and cumulations, that formulates, that concentrates, works, reworks and reviews; that goes slowly, deliberately; that makes very firm and sure, and that eventually arrives at a science of logical statement that shall shape and define the scheme and structure that is to underlie, penetrate and support the form of an art work. It is the hard, the bony structure, it is the tough, tendinous fibre; it may be at times, perhaps, as limber as the lips that move, yet it is never the need of smiling—never the smile.

Third, last and the winsome one, exuberant in life and movement, copious in speech comes expression, open-armed and free, supple, active, dramatic, changeable, beautifully persuasive and wonderful. Hers it is to clothe the structure of art with a form of beauty; for she is the perfection of the physical, she is the physical itself and the uttermost attainment of emotionality. Hers is an infinite tenderness, an adorable and sweet fascination. In her companionship imaginative thought, long searching, has found its own and lives anew, immortal, filled with sensibility, graciousness and the warm blood of a fully-rounded maturity.

Thus art comes into life. Thus life comes into art.

And thus, by reason of a process of elaboration and growth, through the natural storage and upbuilding of the products of nutrition lifting themselves higher and higher into organisation, the physical and spiritual experiences of our lives seeking reproduction shall find imaginative utterance in their own image in a harmonious system of thinking and an equally harmonious method of expressing the thought.

And so it shall come that when our nourishment shall be natural, our imagination therefore fervid, intense and vision-like, when our thinking and our speech shall have become as processes of nature; when, in consequence, from its mysterious abode in visible things, the invisible and infinitely fluent spirit of the universe passing to us shall have made our tongues eloquent, our utterance serene, then and not till then shall we possess, individually and as a people, the necessary elements of a great style.

For otherwise and without this unitary impulse our expression, though delicate as a flower, our thinking as abstract as the winds that blow, our imagination as luminous as the dawn, are useless and unavailing to create; they may set forth, they cannot create.

Man, by means of his physical power, his mechanical resources, his mental ingenuity, may set things side by side. A composition, literally so-called, will result, but not a great art work, not at all an art work, in fact, but merely a more or less refined exhibition of brute force exercised upon helpless materials. It may be as a noise in lessening degrees of offensiveness; it can never become a musical tone. Though it shall have ceased to be vulgar in becoming sophistical, it will remain to the end what it was at the beginning—impotent to inspire, dead, absolutely dead.

It cannot for a moment be doubted that an art work to be alive, to awaken us to its life, to inspire us sooner or later with its purpose, must, indeed, be animated with a soul, must have been breathed upon by the spirit, and must breathe in turn that spirit. It must stand for the actual, vital, first-hand experiences of the one who made it, and must represent his deep-down impression not only of physical nature, but more especially and necessarily his understanding of the outworking of that great spirit which makes nature so intelligible to us that it ceases to be a phantasm and becomes a sweet, a superb, a convincing reality.

It absolutely must be the determination and the capacity of the artist that his work shall be as real and convincing as is his own life; as suggestive as his own eyesight makes all things to him, and yet as unreal, as fugitive, as inscrutable, as subjective as the why and wherefore of the simplest flower that blows.

It is the presence of this unreality that makes the art work real; it is by virtue of this silent subjectivity that the objective voice of an art song becomes sonorous and thrilling.

Unless, therefore, subjectivity permeate an art work, that work cannot aspire to greatness; for whatever of imagination, of thought and of expression it may possess, these as such will remain three separate things—not three phases of one thing.

An artist must necessarily therefore remain a more or less educated hand-worker, a more or less clever sophisticator, a more or less successful framer of compromises, unless, when he was born, there was born with him a hunger for the spiritual, for all other craving avails as nought. Unless, as a child, with that marvellous instinct given only to children, he has heard

the voice of nature murmuring in the woodland, or afield or seaward, no after hearing can avail to catch this revelation.

And thus it is that subjectivity and objectivity, not as two separate elements, but as two complementary and harmonious phases of one impulse, have always constituted, and will always constitute, the embodied spirit of art.

No phase of human nature can contain greater interest for the student of psychology than the history—natural, political, religious and artistic—of the successive phases for good and for ill of objectivity and subjectivity. They are the two controlling elements in human endeavour. They have caused in their internecine warfare misery and perturbation. They are ordinarily known and spoken of as the intellectual and the emotional, but they lie deeper, much deeper, than these; they lie in the very heart of nature. Coming into man's being they have been antagonistic because of the fanaticism and one-sidedness of human nature, because of its immobility. Because from the beginning man has been beset by beautiful, by despicable illusions; because one set of men have believed in what they could see and another set have believed in what they could not see; because it has too often happened that the man who could see with the outer eye could not see with the inner eye; because the other man, rhapsodising with the clear insight of faith, had no thought for the things of this world, neither has believed in the virtue of the other. Neither has inferred from the presence of the other the necessary existence of a balancing but hidden power. Now and then through the ages they have come twin-born in the bosom of an individual man, upon whose brow the generations have placed the wreath of immortality.

So vast, so overwhelming is the power of a great, a properly balanced subjectivity, so enormously does it draw on the spiritual nutrition and stored up vitality of the world, that soon, sapping this up and still craving, the man possessed of it, urged by it, goes straight to the unfailing bounty of nature, and there by virtue of his passionate adoration, passing the portals of the objection, he enters that extraordinary communion that the sacred writers called to "walk with God."

There can be no doubt that the most profound desire that fills the human soul, the most heartfelt hope, is the wish to be at peace with nature and the inscrutable spirit; nor can there be a doubt that the greatest art work is that which most nearly typifies a realisation of this ardent, patient longing. All efforts of the body, all undertakings of the mind tend consciously or unconsciously toward this consummation, tend toward this final peace: the peace of perfect equilibrium, the repose of absolute unity, the serenity of a complete identification.

(To be concluded.)

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of the Association Mr. S. Henbest Capper, architect, read a paper on "The Monks and their Abbeys in Olden Days." At the outset the difference was explained between the monastic life of the East, with its rigid asceticism, and that of the West, where the monks lived together for a common end. When the Benedictines fell away from the strict observance of their early rule, it was pointed out how a reformation towards more primitive austerity was begun at Cîteaux by Robert of Champagne, and was continued and spread by St. Bernard of Clairvaux, who was characterised by the lecturer as the greatest figure in the twelfth century. The Cistercian Order, to which St. Bernard belonged, also became popular all over Europe, and was especially so in this country, possibly, the lecturer suggested, on account of the more prosaic character of its ritual as compared with that of the Benedictines. By the aid of the lime light a large number of typical examples of Benedictine and Cistercian abbeys and churches were thrown upon the screen and their points of difference explained. Speaking of St. Bernard and his saintly character, Mr. Capper incidentally mentioned the great hymn of St. Bernard, "Jesu Dulcis Memoria," and recalled the fact that from it were directly taken two most admired hymns. In the Cistercian monastery the lay brother played an important part, and how his appearance there modified the architectural conditions of the abbey buildings was also illustrated and explained. Views were likewise shown of cloisters, kitchens, refectories, &c., and of the internal furnishings of the churches and cloistral buildings. There was a large audience, who listened to the illustrated lecture with the greatest interest.

The Designs sent in by French architects for the international exhibition buildings of 1900 number 112. Seventy-seven of the competitors met at the Palais de l'Industrie and elected the following jurors, who are accordingly to be considered as being without interest in any of the designs:—MM. Guadet, Coquart, Pascal, Laloux, Moyaux, Loviot, Sédille, Mayeux, Vaudremer, and Ginain. MM. Deslignères and Dutert were elected as supplementary jurors. The report of the jury must be presented before the end of the month.

TESSERÆ.

The Erection of the Parthenon.

SPEAKING of the Parthenon, a scholiast to Demosthenes tells us that "the Athenians, when they became more opulent, caused this third statue to be made of gold and ivory, in memory of the battle of Salamis, and on a scale proportionate to the importance of that battle." It is needless to say that the purpose of the statue determined that of the temple, which, therefore, must have been a monument of victory, in fact, a trophy. The above testimony is one of Wachsmuth's "popular legends and fables," which he supposes to have arisen, in some unexplained way, in late times. He does not seem to have taken the trouble to read the passage in Demosthenes to which the scholiast refers, else he would have seen that the "fable," as he calls it, is as old at least as the orator, who was born during the lifetime of many thousands of persons who saw the Parthenon built. The passage in question occurs in the speech against Androtion, in which Demosthenes, endeavouring to prove to the Athenians the value of a navy, says, "Those earlier men built the Propylæa and the Parthenon and adorned the other temples at the expense of the barbarians, temples of which we are justly proud; left their city, as you know, at least by hearsay, and having shut themselves up in Salamis, were able, from having triremes, to conquer in the naval battle, and so not only to rescue their own property and political institutions, but also to confer upon the rest of Greece many great blessings, of which time can never obliterate the memory." Here is direct evidence, if any evidence is direct, that the Parthenon was considered to have been built with money derived from the share of Persian spoil vowed by the Athenians to the gods. Instead of presenting the share of the booty directly, the Athenians waited until they were in easy circumstances, and then applied a sum of money, equivalent to said share, to erecting and adorning monuments fit for the acceptance of the gods. This is the plain sense of Demosthenes's words, which does not in the least conflict with the well-known fact that the money with which the Parthenon was built was immediately derived from the treasury of the league of which Athens was the head. For some time after the Persian wars the Athenians were in such straits that they doubtless felt themselves justified in borrowing, and applying to the fortification of their city, the share of booty that belonged to the gods. It did not, on that account, cease to belong to the gods, and the Athenians took the first opportunity of paying it back to them, which opportunity occurred in the time of Pericles. When, therefore, Wachsmuth makes the scholiast say that the Parthenon was constructed from the booty taken at Salamis, he puts a forced meaning upon his words, in order to find him in error. These words imply the very reverse, for they tell us that the image was not erected until the Athenians were in easy circumstances. It is hardly necessary to mention the fact that the Athenians habitually borrowed from their goddess, and, like many other borrowers, were often unable to repay. It follows from this that there is no ground whatever for asserting that the Parthenon was less closely connected with the Persian wars than any of the buildings of Themistocles or Kimon. Indeed, in a certain sense it was more closely connected with these than any other building in Athens, for its opisthodomos was used as the treasure-house of the league of which Athens held the hegemony, and both league and hegemony were direct results of these wars. Unless Demosthenes's words are mere impertinent platitudes, they mean that both the Propylæa and the Parthenon were directly connected with the results of the battle of Salamis.

Twelfth-Century Houses.

It is probable the Normans after their arrival in England adopted the dwellings they found in existence until the necessity of their removal, through decay, induced the re-erection of the buildings in an improved and more commodious form, and it began to be found that the repeated destruction by fire of the frail tenements of their predecessors induced the necessity of a change in the material of the houses. Accordingly, in the twelfth century stone with shingle or thatch as a roof covering began to be employed by those who had the means of doing so. This of course tended to confine the ravages of fire to the building where it originated, but the houses thus erected were comparatively few in number, and it is to be remarked that in the decrees of the Assize of London, in the first year of Richard I.'s reign, no provision is made for chimneys. Richard's ordination says the walls were to be 3 feet thick, 16 feet high and of hewn stone; upon these were built wooden gables of heights irregular, and instead of thatch they were to be slated or covered with brent tile. But this material must have been very sparingly used, as we find, so late as 1472, the buildings were remaining uncovered for want of the article, there being "none to get for no money;" so that probably, notwithstanding the royal command, thatch was extensively used interspersed with wooden shingle, and in a few cases lead

was adopted. This is a very curious document, containing much valuable detail respecting town houses in the twelfth century—among the rest, the privileges accorded to all who should rebuild their timber buildings more substantially in stone with tile roofs; regulations as to party walls (the *avant courier* of a Building Act) are inserted, together with some instructions as to drains, cesspools, &c.

Dates on Bells.

It is difficult to guess the exact date of the oldest bells that have come down to our times. Dates there are none at that early period, rarely even the founder's mark or lettering, which may give the exact cue. In bells of the fourteenth and fifteenth centuries there is not this difficulty; for, though they are rarely dated, they invariably have shields, lettering and other architectural devices which enable us to form a tolerably correct guess at their date. These marks, however, are by no means infallible guides to the uninitiated in such matters; for foundries often went on for generations, and marks and stamps were handed down from father to son, often for a century or more. A little close inspection, however, will usually afford some slight addition, either in the stopping or moulding, which decides against the hoped-for antiquity. Mediæval shields and lettering are to be seen upon bells only dating early in the seventeenth century; a date in Arabic numerals often unravels the mystery. Dates came in about 1570 in England, and have been continued ever since. In foreign countries they are met with much earlier. The earliest known dated bell is at Freibourg. Its diameter at the mouth, according to Mr. Tyssen, is 57 inches; height, 5 feet 5 inches; weight, about 2 tons. The inscription is, "O Rex Glorie veni cum pace,—me resonante pia populo succurre Maria, A.D. 1258." At Dunston, in Sussex, is a bell which Mr. Tyssen supposes to be the earliest dated bell in England. The date on this is 1319. This also is of foreign manufacture. At All Hallows Staining is another, with an inscription in honour of St. Martin, dated 1458.

Greek Vases.

When we regard those ancient works in the early purity and youthful freshness of the Greek style, the beauty that pervades those insignificant objects of the potter's art appears truly surprising. It would be difficult to illustrate the power of art more forcibly than by contrasting the exquisite outlines of that very early Greek earthenware with the pots and pans of this vulgar modern world. There is perhaps no greater manual dexterity, no more mechanical skill shown in one than in the other; there may indeed be less exactness of execution in the old than in the new works, but the one has those peculiar qualities which the educated eye at once recognises as the elements of beauty, whilst the other lays claim to no attention and has no æsthetic merit. Certainly it is a phenomenon that would be very surprising, were not the fact so familiar to us, that during the two thousand four hundred or two thousand five hundred years that have passed since the best of those fictile works were produced—a period which comprehends the whole history of human civilisation from the period of primæval simplicity down to the vulgarities of the nineteenth century—there has been an unceasing struggle to alter, vary and improve; after indulgence in every species of novelty, excess and caprice, we have never succeeded so nearly in producing forms beautiful in shape and colour as when we have copied the old Greek type. Beautiful things of this nature have been found in Oriental art; beautiful in Mediæval art; beautiful, too, in the age of the Renaissance; but analyse those several beauties, and you will find that those please us most in proportion as they approach the nearest to that wonderful type. This is not encouraging to modern invention; it is not gratifying to modern vanity; but it is true, and therefore demands our observation. At all events it should teach us modesty, and stimulate us to respect and to study those examples which our earliest teachers have set before us. Whatever may be the cause, the fact is undeniable that though the arts and sciences are usually regarded as kindred pursuits, and are supposed to be intimately associated, they are in truth widely different in their history and destiny. Science has been progressive; step by step men have advanced in the knowledge of the exact sciences as time has advanced. The step of to-day helps us on to the acquirement of a further step to-morrow, and the horizon is thus ever widening as we advance. Quite otherwise seems the destiny of art. The small objects of art illustrate this anomalous fact, and so perhaps may be said of almost every other object of design in the sister arts as well as in architecture. Has Raphael yet been surpassed? Have the works of Phidias yet been rivalled?

Absorption of Water.

The amount of rain capable of being absorbed by the surface upon which it falls depends in a great measure upon the temperature, the geological construction and the physical outline of the district. In making calculations as to the amount absorbed, we must bear in mind that the area of the surface is

the only constant quantity we have to deal with, as its condition and capability for absorbing water vary considerably with the seasons of the year. Under such varying conditions the amount of water absorbed and capable afterwards of being used, when issuing from springs or by sinking wells, is extremely capricious. The greater the quantity of water evaporated or retained by vegetation, the less will remain to be absorbed. Rain descending upon a dry and parched surface in the heat of summer or during the occurrence of drying winds will be nearly all evaporated, so that the rate and amount of absorption depends materially upon the absorbent properties of the soil. Thus in the sands of the red sandstone formation the rainfall is absorbed as fast as it touches the surface, and the same may be said of the rain falling in many places on the chalk formation, while upon the clay soils, or impervious formation, the greatest part of the rain would generally be directly conveyed away by surface streams. The contour of a country in a measure affects the rate of absorption, as the rainfall on mountains or hilly districts has a greater tendency to gravitate rapidly to the rivers, while on table-lands the rainfall lingers, and consequently such lands are favourable to absorption. Experiments made by Dr. Dalton extending over three years on the new red sandstone formation show that 25 per cent. of the whole rainfall percolated to a depth of 3 feet. Experiments made at Fernbridge, in Wiltshire, by Mr. Charnock, on the magnesian limestone formation resulted in giving but 19.6 per cent. of rain percolating to a depth of 3 feet; and a like experiment made by Messrs. Dickenson and Evans on the sandy gravelly loam which covers the chalk about Watford gave as much as 30 per cent. of the rainfall percolating to a depth of 3 feet. In this experiment the average rainfall was found to be 26.33 inches per annum, and the average mean filtration 7.92 inches per annum. Of this quantity 7.34 inches were absorbed between October and March inclusive, which was at the rate of 55½ per cent. on the rainfall of that period, while between April and September inclusive only 5.8 inches of rainfall were absorbed, which was at the rate of 43 per cent. of the rainfall of that period. From this latter experiment it appears that the largest amount of rainfall is absorbed during the months of November, December and January, when practically all may be said to have been absorbed, and that the least amount at any time absorbed was in the month of August, when practically it was nothing. It has been calculated by Beardmore that of the rainfall absorbed in winter 60.7 per cent. is carried off directly at the time of the rainfall, leaving 39.3 per cent. to supply rivers and wells, and of his probably only 33 per cent. of the rainfall absorbed really goes to furnish a supply for wells, which in a measure will account for the failing of many ordinary wells in certain seasons of the year.

Building Materials in Ceylon.

The habitations of the lower class of natives are formed of a rude framework of stout bamboos, the sides and roofs consist of reeds, closed in with the interwoven leaves of the cocoanut palm, the latter being washed over with the slimy juice of a native fruit, which, when dry, resembles copal varnish. In the huts built of "wattle and dab," the framework is made of roughly squared jungle trees, the space between being filled, and both the inside and the outside of the hut being covered with clay and sand well kneaded, afterwards plastered over with earth thrown up by the white ants, mixed with a powerful binding substance produced by the ants. Superior houses are built of "cabook," a soft kind of rock, found at a few feet below the surface. This material has the appearance of a coarse sponge, the interstices being filled with soft clay. Before being used the blocks should be exposed to the rain, to allow some of the clay to be washed out. Cabook requires to be protected from the weather, but if covered with a thin coating of lime plaster it will last for years. Hard kinds of stone are not much used owing to the expense of working them, and rubble masonry is not approved, as there is difficulty in obtaining even beds and good bond. Bricks as a rule are so badly burnt and the clay is so badly pugged that brickwork in exposed situations and unprotected will perish very rapidly. It is advisable that should in all cases be well plastered with lime mortar. Two or three coats of boiled linseed oil will preserve brickwork without hiding it, but the expense prevents its general use. Coal tar is an excellent preservative, but on account of its unsightly appearance it cannot be often employed. Lime is generally made by calcining white coral. When taken from the kiln it is in a fine white powder fit for immediate use, after being mixed with twice its own bulk of sand and water. It sets so rapidly that in the Public Works Department it is the practice to keep the lime under water for two days before using it. This has the effect of making it longer in setting, but it is more easily worked and eventually makes better work, equal in fact to the best blue lias lime. Well-seasoned timber, with free ventilation, will endure for many years if the white ants are kept away, without any precautions being taken to preserve it. In exposed situations and where subject to the attacks of the white ant, Stockholm tar is the best preservative, while

creosoted timber is free from their ravages. In sea water and even in fresh water lakes and canals, timber is speedily attacked by worms, notwithstanding that it is painted, oiled, or tarred. Iron exposed to the influence of the varying weather speedily oxidises, but oil applied hot is a good preventive. Coal tar is, however, the best covering applied either cold or hot, or before or after oxidation has commenced. Ordinary galvanised sheet-iron does not last many years unless protected with good red lead paint frequently renewed, but zinc will last for many years with little or no decay.

Church Bells.

Most, if not all, of our ordinary sound-producers send forth waves which are not of uniform intensity throughout. A trumpet is loudest in the direction of its axis. The same is true of a gun. A bell, with its mouth pointed upwards or downwards, sends forth waves far denser in the horizontal plane passing through the bell than at an angular distance of 90 deg. from that plane. The oldest bellhangers must have been aware of the fact that the sides of the bell, and not its mouth, emitted the strongest sound, their practice being probably determined by this knowledge.

Positive and Relative Beauty.

In architecture, however, as in the highest and most complicated works of nature, two distinct properties of beauty are found to exist—the one is "the positive," or beauty of individual parts; the other (and this by far the most important in respect to architecture) is "the relative beauty" of individual parts to each other, and their connection in an uniform, consistent and harmonious whole. Now, it must be perfectly evident to any observer of nature, that harmonious relationship of parts is the most essential concomitant of beauty and perfection in all constructions which involve plurality and variety of parts. No one could imagine the legs of the elephant to have as good an effect if surmounted by a body of the proportions of the race-horse, as by the huge and solid mass which nature designed them to sustain; or that the delicate head and neck of the giraffe, or the soft and downy wing of the ostrich, could be transferred to bodies of an opposite character to their own, without the most offensive results as regards the laws of proportion, fitness and just relationship of parts, without which excellence, in any complicated production, can never be attained.

Cicero's Tusculum Villa.

If the summit of the Palatine had been selected to keep the memory of its occupant ever fresh in the minds of his countrymen, his villa at Tusculum was his chosen spot for retirement and study. Here, also, though too far removed from Rome to be himself an object of observation, his porticoes opened upon the full view of his beloved city, from which he could never long bear to take off his eyes. From the hill on which this villa stood the spectator surveyed a wide and varied prospect, rich at once in natural beauty and historic associations. The plain at his feet was the battlefield of the Roman kings and of the infant commonwealth; it was strewn with the marble sepulchres of patricians and consuls; across it stretched the long straight lines of the military ways which transported the ensigns of conquest to Parthia and Arabia. On the right, over meadow and woodland lucid with rivulets, he beheld the white turrets of Tibur, Æsula, Praeneste, strung like a row of pearls on the bosom of the Sabine mountains; on the left, the glistening waves of Alba sunk in their green crater, the towering cone of the Latian Jupiter, the oaks of Aricia and the pines of Laurentum, and the sea, bearing sails of every nation to the strand of Ostia. Before him lay far outspread the mighty city, mistress of the world, gleaming in the sun with its panoply of roofs, and flashing brightness into the blue vault above it. The ancient city presented few towers, spires, or domes, such as now arrest the eye from a distant eminence; but the hills within its walls were more distinctly marked, and the statues of its gods—exalted on pillars, or soaring above the peaks of its innumerable temples—seemed an army of immortals arrayed in defence of their eternal abodes. From the bank of Lake Regillus to the gates of Tusculum the acclivity was studded with the pleasure-houses of the noblest families of Rome. The pages of Cicero commemorate the villas of Balbus, of Brutus, of Julius Caesar; of Catullus, Metellus, Crassus and Pompeius; of Gabinius, Lucullus, Lentulus and Varro. Accordingly, the retreat of the literary statesman gazed upon the centre of his dearest interests, and was surrounded by the haunts of his friends and rivals. It was here that, at a later period, when his fortunes were re-established, he composed some of the most abstract of his philosophical speculations; but even these, too, partook of the air of the city and the tone of practical life. The interlocutors of his dialogues were the same men whom he had just left behind at Rome, or whom he might encounter among the shady walks around him; the subject of their conversations never wandered so far from their daily concerns as not to admit of constant applications to the times and constant illustration from them.

NOTES AND COMMENTS.

IT is evidently an expectation in the Scottish Courts that an architect must be always in a serious mood and is not to attempt a joke, although he may be courting. Mr. MACLEAN, of Edinburgh, has suffered because he displayed a weakness of that kind. He sought the recovery of 118*l.* 13*s.* for preparing plans for a hotel at Glenfarg and other professional services. The defendant's version was that in March, 1893, Mr. MACLEAN, who had a short time previously been introduced to his daughter, asked permission to pay his addresses to her on the representation that he was successful in business, possessed of means and of good position. The permission was granted, and the happy pair some time afterwards became engaged. In order to do the plaintiff a good turn defendant introduced him to the proprietor of Glenfarg. The plaintiff knowing that defendant was looking out for a hotel, suggested that he should erect one at Glenfarg. By request Mr. MACLEAN prepared plans for the hotel, which, he said, could be erected for 600*l.* When tenders were received for the building it was found that the cost of erecting it would be 2,000*l.*, and defendant declined to go on further. Without admitting liability, he offered 10*l.* 10*s.* in full of the architect's claim, and maintained that the remainder of the account was unwarrantably incurred by the pursuer. Lord STORMONTH DARLING, who heard the case, said he held it to be proved that the plaintiff undertook to give his services gratuitously, the reason being that he was then the accepted suitor of the defendant's daughter, and said "he would take it out in live stock." His engagement was broken off, and it was creditable to the defendant that he afterwards agreed to pay him professional fees. In his lordship's opinion the authority which the plaintiff got was not to accept estimates except to the extent of testing his opinion that the hotel could be erected for 1,500*l.* He should give decree for the 10*l.* 10*s.*, and should find plaintiff entitled to commission at the rate of 2½ per cent. on the 1,500*l.*, and the decree would therefore be for 48*l.*, with half the costs. Although not half the claim, 48*l.* is better than 10*l.* 10*s.* The unlucky joke about live stock evidently was prejudicial to the architect, for "whigmaleeries" of that kind are not supposed to become a professional noddle.

In another case for the recovery of fees and in which the fall of a gable was pleaded as an excuse for nonpayment, the architect was not suspected of humour and he gained his money. Mr. DAVID FRAZER was the plaintiff. He claimed 3½ per cent. on 1,800*l.*, cost of extension of an hotel, besides other fees. The defence was that the gable fell because it was wrongly designed. The Sheriff who heard the case said the defendant failed to prove that the gable fell through the fault of the plaintiff, or that it was proved to have fallen because it had been newly built, and not because of a strong wind blowing at the rate of about fifty-five miles an hour. The extra claims were disallowed because they were presumed to be either for work that the defendant did not employ the architect to do, or they were covered by his commission of 3½ per cent., which was allowed with a sum for alterations. In a note the Sheriff said a host of small questions had been dragged into the case; but there was only one question of cardinal importance, and that was whether the gable in question fell through the fault of the plaintiff. In its strictly professional aspect, the accusation of fault took the form of an assertion that the gable fell because it was badly designed, and in particular because of the weight of the chimney over the building; and that plaintiff connived at bad mortar, either because of corrupt partiality to the builder, or because of offended pride because defendant appointed an inspector of works without consulting him. The only spark of truth the Sheriff saw in that part of the defence was that plaintiff's feelings had been hurt by the appointment of an inspector without communicating with him. He did not in the least believe that plaintiff betrayed defendant's interest. The fall of the gable was an inevitable accident, what lawyers called a *damnum fatale*. No practical man, he concluded, ever propped up such a gable, and to urge that this might have been done was absurd. This judgment is the more satis-

factory, as the defendant evidently mistrusted the architect and set a watch upon him, an act which deserved a heavier penalty than the payment of ordinary fees.

THE timber spire of the cathedral of Dijon was considered to be the most characteristic part of the building. In 1885, owing to its defective condition, it had to be demolished. It was not, however, the earliest example, for it had two predecessors. The spire or *fèche* was about 300 feet high, and from the smallness of the base presented a very acute appearance against the sky. Soon after the demolition M. SUISSÉ, the diocesan architect, prepared designs for a new spire, and after operations which have occupied seven years, and cost nearly 400,000 francs, it has been completed to the satisfaction of the inhabitants. The primary cause of the failure of preceding spires, it was conjectured, arose from a settlement of the piers rather than from a decay of the timber. It was accordingly decided to fill them with *béton*. No less than seven months were devoted to that part of the work, and about ninety tons of *béton* were laid. The spire has been carefully calculated in order that all the timbers will be of adequate strength. They form a series of triangles with horizontal bracing at regular intervals. The timber is covered with slates, with occasional openings for tracery, and near the roof slates are introduced. In its appearance the new spire surpasses its predecessor, and from the care taken with the foundations and carpentry we may assume that it is destined to have a longer duration. M. BILLETTE was the contractor under M. SUISSÉ, and he has been enabled to complete a most dangerous work without any accidents.

THE Hen and Chickens Hotel, in Birmingham, was not a picturesque building, but it dated from the early part of the eighteenth century, and it afforded shelter to actors, singers and agitators, with an occasional poet and man of letters. In his whimsical but ultra-logical way DE QUINCEY compared it with a more modern American hotel. He granted that "the Birmingham Hen and Chickens undoubtedly had slight pretensions by the side of these Behemoths and mammoths. And yet," he added, "as a street in a very little town may happen to be quite as noisy as a street in London, I can testify that any single gallery in this Birmingham hotel, if measured in importance by the elements of discomfort which it could develop, was entitled to an American rating." Birmingham has been changing, and the Opium Eater's adjectives, "gloomy, noisy and dirty," are no longer applicable to it. Examples of a new class of hotel were raised, with which the Hen and Chickens could not compare. It is about to pass away in order to afford a site for the new King Edward VI.'s High School for Girls, which it is anticipated will uphold the reputation of the town equally with the famous school for boys.

ANOTHER edition of the Building Act has appeared. It is edited by Mr. W. F. CRAIES, a barrister, and published by SWEET & MAXWELL, Limited. The notes are numerous and acute. Anomalies are not ignored. Thus, in one place it is pointed out that "new building seems to include stables pulled down and re-erected with the old materials, and houses erected without foundations." Another note calls attention to the fact that the materials specified in the second schedule as "fire resisting" are not specifically declared to be "incombustible" or "fireproof" within the meaning of the Act. Apropos of section 107, it is suggested that London county justices appear to have jurisdiction under the Act. Doubt is expressed whether section 138 does not include internal fittings and partitions in buildings as among the work that is subject to the supervision of the district surveyor. Novices who obey section 187 may not be aware that notices which "shall be in writing" may be printed, lithographed, photographed or produced by any other mode of representing words in a visible form. It is anticipated that most readers will be familiar with the former Acts. Accordingly the repeated sections are indicated as well as all matter which is new. It is essentially a lawyer's edition, but architects, surveyors and builders can also make use of it with advantage to themselves and their clients.

MINERVA VISITING THE MUSES.

SOLICITORS TO THE SUPREME COURT LIBRARY, EDINBURGH.

NO. 1 HOLLAND PARK, W. RESIDENCE OF MR. VAL PRINSEP, R.A.

A DOORWAY BY GRINLING GIBBONS.

THE drawing, of which an illustration was published last week, forms the entrance to what is said to have once been the Spanish Ambassador's residence, and dates from about 1680. It is now the entrance to No. 33 Mark Lane, which is let as offices. It is a fine piece of work, executed by GRINLING GIBBONS, one of the first wood-carvers of his time, but, like all good things, has to be sought out, for it is comparatively hidden at the end of a court out of Mark Lane, in the City, and access to it has to be obtained through an archway, under Nos. 31 and 34, before you can approach near enough to see its beauties.

The mansion originally included Nos. 31 and 34, and the front and back arches to this archway through these premises contained some more of what is doubtless GIBBONS's work, being formed with broken pediments, and entablature supported in one case on fluted Corinthian columns, and all mouldings enriched and the spandrels carved. These arches were purchased on the report of

MARK LANE

Mr. PULLEN and Mr. CLARKE by the South Kensington Museum from Mr. PERY STANDISH, the owner of the property, when the front portion was pulled down and rebuilt in 1884, and they may be seen in the South Galleries of the exhibition buildings used for the Educational Museum of Building Construction and Machinery, an inappropriate place for a work of art; but Mr. CLARKE informs me he waits for a public demand for the study of such work before he can put them in their proper place in the museum. Shall we not raise the cry? Like the doorway, the carving to these arches was much choked with the paint of generations, but this was pickled, and the carving now stands out in all its sharpness.

Entering the passage through the doorway of No. 33, with the aid of a light can be seen paintings of heads in conventional shields on the raised panels of the old doors to the offices, now darkened with age, and still more with varnish.

The staircase at the end of the passage to the left is

good, and has alternate fluted and twisted balusters and carved spandrel ends to the treads.

In two of the offices there still exist good examples of enriched plaster ceilings, through which glazed screens have been ruthlessly cut.

At the back of the mansion, the tenants inform me, was originally a court-yard, with a fountain, foreign trees, and steps up to the different entrances; but now all is gone, and the space occupied by one-storey buildings used as offices, the only vestige of the old work being a good doorway, and an enriched cornice to the upper portion.

There are also said to have been two wrought-iron gates at the Mark Lane entrance, but no trace is left of these. Some also say that the house dates from ELIZABETH's time, and that the red-brick gauged work is merely a casing against the old.

A. H. BELCHER.

ARCHITECTURAL BOOKS.*

By HERBERT BATSFORD.

(Concluded from last week.)

ALTHOUGH it will be something of a departure from chronological order, I think it will be a convenient arrangement if I now deal with books illustrating the architecture of our own land and then with those illustrating the different countries of Europe, omitting altogether books dealing with the art of the primitive races of these islands. I think the place of honour is due to those of John Carter, the pioneer of the Gothic revival. They are entitled "Ancient Sculpture in England" and "Ancient Architecture in England," and were first published in 1780 and 1795 respectively, but the later editions have notes by John Britton, that grand archaeologist, who published upwards of fifty volumes devoted to the archaeology of his country. I will not weary you with a catalogue of the literature of the Gothic revival, but a few of the books which greatly influenced it must be mentioned in the order in which they appeared, and first must be reckoned the works of John Britton before alluded to. In 1804 he commenced his "Architectural Antiquities of Great Britain," and between 1814 and 1832 he published his celebrated illustrations of fourteen of our English cathedrals, a series of fourteen volumes which still remain the finest of their kind issued in any land. The difficulties he met with in obtaining permission to draw in some of these buildings are recounted with something of bitterness in his autobiography. Britton was ably seconded in his illustrations by the celebrated engraver Le Keux, whose name is found on so many of the fine engravings of architectural subjects published at this period. With these of Britton's should be added Wild's illustrations of Lincoln Cathedral, which he adopted, and the Durham and Carlisle Cathedrals of that charming draughtsman and archaeologist, Robert W. Billings. At the same time that Britton was placing before the public his splendid series of illustrations, that remarkable father of a yet more remarkable son, Pugin, was working upon more strictly architectural lines, and published in 1821 his "Specimens of Gothic Architecture," two volumes, which contains the first exact illustrations of English Gothic; in 1831 he published "Gothic Stone Ornaments," which is beautifully drawn on stone by J. D. Harding, and in the same year commenced his "Examples of Gothic Architecture." Of this the second volume, published about 1835, bears, jointly with his own, the name of his talented son Augustus Welby, the architectural genius of the century, of whom Mr. Eastlake wrote, "His name marks an epoch in the history of art which, while art exists at all, can never be forgotten." In 1836 appeared that bitter satire upon the architecture of the day, entitled "Contrasts," or a parallel between the noble edifices of the Middle Ages and corresponding buildings of the present, showing the present decay of taste, the appearance of which made him many enemies, and a few years afterwards he essayed to mollify them by the issue of a small brochure, under the title of "An Apology for 'Contrasts,'" which is very scarce indeed.

In quick succession followed his "True Principles of Gothic Architecture" and "An Apology for the Revival of Christian Architecture," with, in 1844, his remarkable book, considering the date of its production, the "Glossary of Ecclesiastical Ornament and Costume." I need hardly say that all these works of the Pugins, with others of less importance, which I need not mention, should be included in our library. Proceeding to notice further works upon ecclesiastical buildings before dealing with those more especially devoted to domestic, I would mention one which should have found an earlier place, Cottingham's large monograph on Henry VII.'s Chapel, West-

* A paper read before the Society of Architects on Tuesday, December 11, the president, Mr. E. J. Hamilton, in the chair.

minster, which is of great value for the study of Perpendicular work, notwithstanding the rough production of the drawings by lithography in its early days (1822). Soon after the appearance of the later works by Pugin came those well-known volumes of the Brandons, "Analysis of Gothic Architecture," two volumes, "Open Timber Roofs of the Middle Ages," in one volume, and "Views and Plans of Parish Churches." Almost simultaneously appeared Mr. Sharpe's magnificent folio "Architectural Parallels," illustrating the progress of ecclesiastical architecture in England and Wales through the twelfth and thirteenth centuries, of which Professor Roger Smith says:—"Here a certain number of Gothic abbey churches, chiefly those of Yorkshire, are anatomised, compared and contrasted in the most thorough and interesting manner, and the student cannot do better than turn to it constantly whilst making his way through Rickman's 'Gothic Architecture.'" A supplement to the "Parallels" was published, giving the mouldings of these abbey churches drawn full size. I will here briefly mention the "Seven Periods of English Architecture," the "Ornamentation of the Transitional Period," "Mouldings of the Six Periods," which he unhappily left incomplete, and his smaller book, "Window Tracery in England," all excellent books on their subjects.

Then close along followed Mr. Colling, who, I am happy to say, is still amongst us, with his beautifully-drawn works, "Gothic Ornaments," containing 200 plates of stone carving, with a few examples of Mediæval coloured decoration, and "Details of Gothic Architecture," two volumes, intended to further elucidate such features as were only partially developed in Brandon's "Analysis." These two works of Mr. Colling are, I think, unsurpassed by any illustrating English architecture, both for the amount of work put into them and the correctness and beauty of the drawings, which were mostly made on the spot by the author from his own measurements. I fear that he has never received the recognition due to him for their production, and I regret to add that he has derived no pecuniary benefit whatever from their publication.

In 1857 Messrs. Bowman & Crowther, the Manchester architects, published an important work, "Churches of the Middle Ages," being selected "Specimens of Early and Pointed Structures, with a few of the purest late Pointed Examples," two folio volumes, giving what may be termed a series of working drawings of examples of church construction in these different periods. To these I must add Wickes's highly artistic, yet correct, drawings, entitled "Spires and Towers of the Churches of England," "Churches of the Nene Valley," the drawings for which were made by Messrs. J. Johnson and W. H. Kersey, under the direction of Mr. Sharpe, by whom the accounts of the churches were written. Mr. James Neale's carefully-drawn monograph of the Abbey Church of St. Albans before its restoration and Mr. Gilbert Scott's most valuable "Essay on English Church Architecture" prior to the separation of England from the Roman obedience. Other minor works are Sir G. Gilbert Scott's "Rise and Development of Mediæval Architecture," Rickman's "Gothic Architecture," Wallcott's "Church and Conventional Arrangement," Paley's "Gothic Mouldings" and "Baptismal Fonts," Wollmann's "Examples of Ancient Pulpits," Bury's "Ecclesiastical Woodwork," Bloxam's "Principles of Gothic Architecture," Professor Willis's paper on the "Vaults of the Middle Ages."

Turning now to the works illustrating the domestic architecture of own country, and taking them in chronological order of the periods they illustrate, I must place first Britton's "Architectural Antiquities of Great Britain," already mentioned; next, Hudson, Turner and Parker's "Domestic Architecture of the Middle Ages"; Mr. F. T. Dollmann's "Analysis of Ancient Domestic Architecture," two volumes, containing 160 excellent plates, certainly a unique work illustrating domestic buildings down to the sixteenth century in a thoroughly practical manner; and Pugin's "Examples," three volumes, already referred to and which is too well known to need comment. Of half-timbered work some of the best examples are illustrated in Clayton's "Timber Edifices of England," a very scarce folio, and Habershon's "Half-timbered Houses of England." Nash's "Mansions of England in the Olden Time" needs but a passing mention; it is known to all in its original or smaller edition, and I need only say, get the former if you can. Richardson's "Studies from Old English Mansions," if not so widely known as it deserves, certainly for the architect for whom it was more particularly prepared and to whom it is more useful, contains a variety of details of all descriptions. Of a much later production, "Architecture of the Renaissance in England," by Mr. Gotch, I shall not express an opinion; most of you have, doubtless, some knowledge of it. I should add that two lesser works by Richardson, and "Details of Elizabethan Architecture" by Henry Shaw, are worthy of notice, and that, in my opinion, the whole of the volumes of the "Architectural Association Sketch Book" are of the utmost importance in a good architectural library, both on account of the large amount of English work illustrated in them, and for the variety and charm of the draughtsmanship.

They contain a large amount of excellent work not illustrated elsewhere, and include valuable details in wood and metal-work.

For illustrations of the later Renaissance and Classic revival in England the best works are the following:—Inigo Jones's "Designs for Public and Private Buildings," which includes most of his executed works; Clayton's "Large Drawings of the Churches of Sir Christopher Wren," which illustrate them all except his masterpiece, St. Paul's; "Vitruvius Britannicus," started by Colin Campbell and finished by Woolfe and Gandon, illustrating the public buildings and private mansions designed by Inigo Jones, Sir Christopher Wren, Sir J. Vanbrugh, and other celebrated architects of the time. Gibbs's "Book of Architecture," which includes illustrations of St. Martin's Church, and the "Works in Architecture, Decoration and Furniture" of those prolific architects, the Brothers Adam, of Adelphi fame, a rare work, consisting of beautiful engravings of the most important works carried out by them.

The earlier architecture of Scotland is most delightfully illustrated in Billings's "Baronial and Ecclesiastical Antiquities of Scotland," four volumes, which contain 250 engravings. For further illustration MacGibbon and Ross's very voluminous large octavo volumes on the "Castellated and Domestic Architecture of Scotland," and the sketch book of the Edinburgh Architectural Association should be consulted. Many of the Classic buildings erected in the eighteenth century will be found in "Vitruvius Scoticus," a bulky volume by William Adam, father of the celebrated brothers just mentioned.

I must not be guilty of "one more injustice to Ireland" by omitting to tell you that her ancient architecture has been well illustrated in the comprehensive work, "Notes on Irish Architecture," in two volumes, folio, by the Earl of Dunraven, but I need hardly add the subjects illustrated are rather archæological in their interest.

Dealing next with French architecture and commencing with the Gothic, as I have already dealt with the Romanesque period, we find an early English authority in John Sell Cotman, whose "Architectural Antiquities of Normandy," two volumes, published in 1822, vividly portrays, in a series of vigorous etchings, the beauties of Norman architecture. These were accompanied by historical notices by Dawson Turner. I may here mention that the elder Pugin published his "Architectural Antiquities of Normandy," with beautifully detailed plates, in 1828. A very complete book on this period of architecture, "L'Architecture Normande," by Ruprich-Robert has been issued. It illustrates in a most thorough manner architectural remains both in Normandy and England. But French Gothic architecture is insuperably associated with the name of M. Viollet-le-Duc, who in 1854 commenced the publication of his famous "Dictionnaire Raisonné," with its 3,500 illustrations drawn by his own hand. It may be remarked that the publication of this remarkable work came at a time when English architects were turning towards French Gothic, and its influence, together with that of his companion work the "Dictionnaire du Mobilier," greatly spread that taste for French Mediæval art which held its sway in this country for so many years, only to be followed by the introduction of French Renaissance, for which purpose "Sauvageot" and other works were already in existence.

But I am anticipating somewhat: other English books illustrating French Gothic rapidly followed and led to its general adaptation. Amongst the first of these I must name "Mediæval Architecture of France," by Henry Clutton, published as early as 1853, and Mr. Norman Shaw's "Sketches from the Continent" (1858), illustrating many of the French cathedrals, and the companion work, "Specimens of Mediæval Architecture," by Eden Nesfield, which appeared in 1862. These two works are well-known; yet I cannot refrain from quoting Mr. Eastlake's words, that "the skill, the delicacy of touch, the attention to perspective and the knowledge of detail which they exhibit is worthy of all praise." Then, in 1864, one of the most valuable volumes of masterly geometrical drawings and perspectives, "Specimens of Early French Architecture," by the late R. J. Johnson, which was much appreciated, and quickly went "out of print." In his preface the author says, "The examples have been selected to display that nobleness, simplicity and masculine vigour so strikingly characteristic of the period in France, and it is believed that those who are studying Christian architecture will find the results of a laboriously measured series of 'specimens' of the utmost value." In 1865 were published two volumes of photographs of 500 delightful sketches, made by the younger Pugin during his continental tours, between 1836 and 1847. These little sketches, whether representing in a most minute manner some continental building, or depicting, in a few lines, some detail of stone, wood, or metal, seem to present the object with a force and fulness quite out of proportion with the scale of the drawing. In 1870 William Burges published his "Architectural Drawings," a folio volume of plates, which represented in a bold manner some striking features of construction and early French details, mostly of the thirteenth

entury. This is the last English book devoted to French Gothic, and is in some respects the most remarkable.

There is another fine book by M. Jules Gailhabaud, whose name I have already mentioned, in five volumes, entitled *L'Architecture du V. au XVII. Siècle, et les Arts qui en dépendent*, and much of it is devoted to illustrating the French cathedrals. Two works devoted to French Gothic architecture are Adams's "Recueil de Sculptures Gothiques" and Baudot's "La Sculpture Française," a beautiful work issued some four years since. I am anxious to draw your attention to a work issued some three years ago by Gelis-Didot & Laffillé, entitled "La Peinture Décorative en France," which gives the most perfect series of reproductions of ecclesiastical mural decorations ever issued, from water-colour drawings specially made. I should like to see a similar work illustrating English examples in so fitting a manner.

German Gothic architecture is well illustrated in Förster's *Monuments de l'Architecture*, &c., eight volumes, quarto, and I must here speak of two favourite books which give examples of both French and German Gothic; the first is by one of the greatest archæologists we have ever had, T. H. King. The title of the book so well explains its scope that I give it in full, "The Study Book of Mediæval Architecture and Art, being a series of working drawings of the principal monuments of the Middle Ages, whereof the plans, sections and details are drawn to uniform scales." In the four volumes we have mostly drawings of some hundred different churches, and examples of metal-work, stained-glass, &c. The other is Verdier et Cattois's "Architecture Civile et Domestique," published in 1857, which contains over 100 engravings, illustrating many charming examples of Gothic domestic buildings in Italy and France.

For Italian Gothic architecture we must go to Ruskin's "Stones of Venice," and his "Examples of the Architecture of Venice," Street's "Gothic Architecture in North Italy," second edition published in 1874; Dr. Rowand Anderson's "Examples of the Municipal and Street Architecture of France and Italy," Gruner's "Terra-cotta Architecture of North Italy," which has coloured plates, published in 1867; and Rohault de Fleury's "Toscane au Moyen Age," two volumes, folio, of most delightful drawings in the Mediæval spirit, published in Paris in 1873.

Spanish Gothic has not been well illustrated in an architectural manner, but we get a comprehensive review of it in Street's "Gothic Architecture in Spain," an octavo, published in 1865. Many exceedingly artistic and picturesque drawings, including illustrations of the cathedrals, are given in "España Artística y Monumental," three volumes, folio, published between 1842 and 1850. Notwithstanding that Spain cannot be regarded as one of the wealthiest of nations, it is refreshing to know that for many years past the Government has contributed towards publishing a suitable record of the architectural and art wealth of the country. But for want of support the publication had to be discontinued before the work they had set themselves to do was accomplished. The result of their support is seen in six very large folio volumes, which are on the table, from which you will be able to judge of the grandeur both of the work itself and the monuments it illustrates.

We now reach the Renaissance period, and we naturally must in the first place take those books which illustrate the beautiful examples of the land of its birth, and I think I may first name Palladio's "Architecture," the best of the English translations of which is that by Leoni, as it gives a good number of Palladio's pure designs. Then I will remind you of those two remarkable works, the result of years of labour and study, that make us freely translate and paraphrase the celebrated "Wren epitaph" and say of the authors, "If you seek a monument of them, look at their works." Letarouilly's "Edifices de Rome Moderne," three volumes, folio, containing 335 engraved plates of measured drawings of the famous palaces and churches. It is said the author devoted thirty years of unceasing labour to this monumental work; still his energy was far from being exhausted, for he spent the remaining years of his life in preparing drawings for a rich monograph in two volumes, on the Vatican and St. Peter's, entitled "Le Vatican et la Basilique de Saint-Pierre de Rome." It is much to be regretted that the author did not live to witness the publication of these volumes some twelve years since. You are all, I am sure, aware of the great aid that photography has been to us in representing architecture, and in some recent years the excellent methods of permanent printed reproductions, showing detail perfectly, have led to many works being published that could not have been otherwise. One of these, entitled "Baudenkmäler Roms," is a volume, I fear, but little known, although it should certainly be found in every library which possesses a copy of Letarouilly's "Rome." It contains one hundred photographic plates, consisting of views of façades, &c., and is intended to extra illustrate Letarouilly's drawings.

This combination of photographs and measured drawings should, I think, make the perfect architectural book. There is a magnificent volume of engravings by Volpato, illustrating

Raphael's arabesques of the Vatican, a copy of which is here, and will well repay inspection. Herr Schutz's comprehensive series of 330 plates, reproduced from photographs, entitled "Die Renaissance in Italien," thoroughly illustrates the Renaissance architecture, sculpture and ornament of Italy. There remains Nicolai's "Das Ornament der italienischen Kunst," consisting of 100 phototypes, illustrating the delicate architectural ornament of the fifteenth century. It is a very fine and useful work. There remains now to be mentioned Cicognara's "Le Fabriche di Venezia," which, in a series of 257 line engravings, illustrates Venetian architecture, chiefly of the Renaissance period; it is regarded as the companion to Letarouilly, though it is to be regretted that the quality of the drawings are not of equal merit. Signor Ongania has recently given us a charming series of 100 views, reproduced in photogravure, in his "Streets and Canals in Venice," a copy of which is here for your inspection. Other works that cannot be omitted from my list are Gruner's "Fresco Decorations of the Churches and Palaces of Italy," containing fifty-six minute engravings, which is most valuable for Italian interiors and has some coloured plates. The same author's "Specimens of Ornamental Art," another large folio issued in 1850, containing fifty plates mostly in colour, depicting to a large scale various Italian ceilings, decorations and ornaments. "Architectural Art in Italy and Spain," by Waring and Macquoid, large folio, published in 1850, and containing a good collection of Italian palatial architecture and details. It is interesting to note that they were pioneers in drawing attention to some beauties of the Renaissance architecture of Spain.

The next books which call for our attention are those illustrating the Renaissance in France, and a most reliable series of illustrations is to be found in a work no doubt familiar to many of you, Sauvageot's "Palais, Châteaux et Maisons de France," four volumes, small folio. In its series of nearly 300 engraved plates the work gives monographs of French châteaux illustrating various phases of the later Renaissance. For further details the library should possess César Daly's "Motifs Historiques d'Architecture et de Sculpture." The first series, in two volumes, folio, has 200 engraved plates of exterior architectural details and ornaments, and the second series, also in two volumes, contains 250 similar plates, illustrating interior decorations. A few of these plates are printed in colours. But side by side with these must be placed Victor Petit's splendid series of 100 folio plates, drawn on stone by the author, illustrating the châteaux of the Loire Valley. Issued in Paris in 1861, it will ever remain one of the best productions of its time. A very interesting work, illustrating the interior decoration and woodwork of the early Renaissance, is Rouyer's "Décorations Intérieures de la Renaissance," published a few years since, and invaluable books to refer to for information and illustrations concerning every branch of French decorative art are Viollet-le-Duc's "Dictionnaire du Mobilier Français," six volumes, octavo, and Havard's "Dictionnaire de l'Ameublement et de Décoration," four volumes, quarto. The first of these deals exhaustively with French Gothic art, and the second is rich in its treatment of the later periods.

There are various monographs on special châteaux, notably one on the "Château de Blois," illustrated by permanent photographs and coloured plates, and Pfnor's "Palais de Fontainebleau," forming, with its later volume illustrating the rich interior, three volumes, folio.

The works in Belgian, Dutch and German Renaissance must now be briefly considered, and here the first place must be given to that surprising testimony of the power of one indefatigable worker to make the art of his country known. I refer to the volumes entitled "Documents classés de l'Art dans les Pays-Bas," published by M. Van Ysendyck, an architect living in Brussels. Here are to be found 700 folio plates, chiefly collotypes, and, as one of his critics truly said, doing for the art of the Low Countries what Viollet-le-Duc had done for the Mediæval art of France. I suppose that we must say that further credit is due to the author's energy in issuing his work without the aid of a publisher. Yet even with this extraordinary series of illustrations we cannot dispense with Proert's "Sketches in Flanders and Germany," fifty beautiful drawings most delicately reproduced by lithography, and Louis Haghe's three folios of sketches in Belgium and Germany, also reproduced by lithography, which works picturesquely and vividly bring before us the quaint architectural beauties, both exterior and interior, to be found in these countries. Then there is a capital collection of 300 phototypes, known to many of you, I think, entitled Fritsch's "Denkmäler deutscher Baukunst." These well illustrate the architecture in the old towns of Germany. The last book to mention is "La Renaissance en Belgique et en Hollande." It comprises nearly 500 lithographed drawings, chiefly of architectural details, and is most suggestive, and well supplements Fritsch's volumes, which depict but views and façades.

The buildings of the Spanish Renaissance are illustrated in the Government publication I have previously spoken of, in Sir M. Digby Wyatt's volume of clever impressionist sketches

entitled "An Architect's Note-book in Spain," and in Mr. A. N. Prentice's recent volume "Renaissance Architecture and Ornament in Spain," for which I am pleased to say the author has received his meed of praise.

As I have already mentioned the principal authorities on the interior decoration of the various historic periods, there remain but few others for me to particularise on this and some special arts as applied to architecture. For examples of historic ornament our library must possess Owen Jones's "Grammar of Ornament," the original folio edition of which was published in 1856, and a smaller edition, the plates being reduced, in 1865. To this may well be added the two series of Racinet's "L'Ornement polychrome," which give some 3,500 fresh examples. I would certainly include César Daly's "Décorations intérieures peintes," two volumes, folio. The examples shown in this book are all printed in colours and are copies of decorations which were carried out in Paris about fifteen years since; no work has ever appeared which sets before us so truthfully and artistically complete schemes of colour decoration. The books on furniture and woodwork which I would put on our library shelves in addition to those previously mentioned are Marshall's "Specimens of Antique Carved Furniture and Woodwork;" Small's "Scottish Woodwork of the Sixteenth and Seventeenth Centuries;" Shaw's "Specimens of Ancient Furniture;" and for the later styles, Heaton's "Furniture and Decoration in England during the Eighteenth Century," a work which gives 200 selected plates of reproductions from the scarce works by Sheraton, Hepplewhite, Chippendale, the Brothers Adam, Pergolesi and others. Copies of the original books can be added later if the library is so disposed.

The volumes which I should place in the library on constructive metal-work are Mr. Starkie Gardner's little handbook—and I hope to see a more important work from him on this art, to which he is so devoted; Heftner Alteneck's two volumes on the metal-work of the Middle Ages and Renaissance, entitled "Eisenwerke-Ornamentik der Schmiedekunst des Mittelalters und der Renaissance;" and D. J. Ebbett's "Decorative Wrought Ironwork of the Seventeenth and Eighteenth Centuries."

For examples of monuments from the Celtic times to the eighteenth century, we need only have Brindley and Weatherley's "Ancient Sepulchral Monuments," which has 600 specimens selected from all authorities, and to help us in the designing of stained-glass we need place in the library Winston's "Hints on Glass-Painting," two volumes, octavo, published in 1867; Diver's "Works of Early Masters," two volumes, folio, containing many coloured plates of Belgian, Dutch and English examples; and above all Mr. Westlake's most painstaking and scholarly work on the "History of Design in Stained-Glass," the fourth and concluding volume of which has just appeared.

Now I think you will agree with me that, with few exceptions, we do not want to study modern continental architecture except for suggestions of construction and planning. The books which I consider worth a place in our library are Daly's "L'Architecture privée aux XIX. siècle," first and second series, in six volumes, folio, containing 450 engraved plates, ennobling the principal mansions, hotels, shops, restaurants, &c., erected in Paris and the suburbs during the reign of Napoleon III., and under the control of Baron Haussmann; a later book in four volumes, folio, by M. Narjoux, entitled "Paris: Monuments élevés par la Ville," the seventy-eight monographs in which describe town halls, markets, schools, hospitals, work-houses, abattoirs, morgues, &c.; then the elaborate monograph illustrating M. Garnier's magnificent building, the new Opera House at Paris, in two volumes, large folio and quarto text, and the equally extravagantly produced works on the Opera House and the Palace of Justice at Vienna. But when we come to consider modern architecture in England we have to confess that there is no book illustrating it—something to be deplored when we know the admirable work which has been designed by our leading architects, and the value of it for study by all. Mr. Mountford, in the course of his recent interesting address to the Architectural Association, said, "The one and only way to learn how to design is by the constant study of existing work, I say existing work advisedly, because it is my belief that the study of modern work is as necessary, and more useful, perhaps, than that of old work. Of course we must study old work, that goes without saying, but by all means study modern buildings as well." For illustrations of this modern work we have to turn to the architectural journals. You know them well, but let me just mention them, and the year of their first publication. *The Builder* was commenced in 1843, *The Building News* in 1857, *The Architect* in 1869 and *The British Architect* in 1874; and with sets of these Journals should be included a set of the "Transactions of the Royal Institute of British Architects," the later volumes of which are splendidly produced. In these five sets we shall not only find modern

work illustrated, but, to quote Professor Roger Smith's words "Papers on and illustrations of almost every subject that you can think of. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded." To make the library complete must be added, when they can be met with, sets of the "Sketch Books" issued by private societies, all illustrating examples of ancient architecture, and many interesting details of wood and metal-work. The chief of these are "The Architectural Association Sketch Book," of which, since 1867, twenty-four volumes have been issued, containing over 1,700 plates; "The Spring Gardens Sketch Book," commenced in 1866 at the suggestion of Sir G. Gilbert Scott and Mr. J. T. Micklethwaite, and finished in 1891, the result being eight large folio volumes, containing nearly 600 plates, naturally mostly illustrating Gothic work. Not more than seventy-two copies of any volume were published. Then there is "The Abbey Square Sketch Book," initiated by Mr. John Douglas, at Chester, and of which three volumes have appeared; and lastly "The Edinburgh Architectural Association Sketch Book," of which five volumes have been issued.

There are many points which I have not been able to touch upon, and the subject has not been treated as it deserves, partly on account of want of time on my part in preparing my notes, due to the very limited leisure I have been able to allow myself, and further, owing to the short period given me in which to present my paper to you. But I trust I have shown you that upon the history of architecture a noble series of volumes exists, and although many of the authors mentioned are foreign, I think we, as Englishmen, may justly pride ourselves not only on the part our countrymen have played in forming the history of art, but especially so for the valuable works they have produced illustrating the architecture of the past, especially of their own land.

I thank you for the kind attention you have given to my paper, and should time permit I shall be pleased to listen to any criticisms you may make upon it. If I have made any of you feel an increased interest for architectural books, my paper will indeed have not been read in vain.

THE MODERN THEATRE OF THE CONTINENT.

By EDWIN O. SACHS.

(Continued from page 381.)

THE BUILDING.

THE theatres of our country are built to fulfil the prosy requirements of the investors or ambitious actors, who cater for the pleasure and sensation seekers of a people practically devoid of any feeling for architecture. They are essentially utilitarian structures, with a little art thrown in occasionally for advertisement. The modern theatre of every class on the Continent is always intended to figure as a fitting home of the ever popular invigorating and revered dramatic art of nations who have a *bona fide* interest in architecture and who wish to see their hobby and pride housed in appropriate surroundings. Thus it comes that our English theatres, as a rule, simply require architects who are clever planners, good constructionists and business men. It is a minor consideration if there is art feeling in the architecture, if he have an art ghost, or simply relies on some fibrous plaster manufacturer for his so-called art. If anything, it is more important that he should have the talents and facilities of a financial agent or company promoter. Abroad, on the contrary, theatres must have architects who are really architects in the best sense, and who, if anything, attach the greatest importance to the art side of their profession. They are allowed to have ghosts, but these phantoms must only belong to the species that revels in specifications, sanitation, warming and ventilation, stresses and strains. The theatre architect must have real interest in the essentially technical side of his work, but as an architect, and not as a mere financial agent, or as an engineer. He must be conversant with the art of planning, but not necessarily be expert in the details of stage machinery, of electric lighting, &c. In short, practical artists have the jobs, not what we would term surveyor-architects. This is only as it should be, too, for work where questions of finance and time need seldom influence the erection.

A modern continental theatre, to my mind, is the most difficult object an architect can have to tackle, and requires every atom of that what may be described as the true spirit of an architect; a maximum amount of real beauty is required, including the most careful blending of architecture, sculpture and painting, and this where all the practical requirements are

generally against the realisation of perfection, and where the requirements are more complicated, more numerous and more essentially technical than in any other class of work.

The architects who have been able to satisfactorily complete a modern theatre abroad have necessarily at once ranked among the first, if not as leaders, in their profession. Let me mention names—the deceased Gottfried Semper in Germany, Baron Hasenauer in Austria, Von Ihyl in Hungary, Basile in Italy, and then there are among the living Garnier of Paris, Anderberg of Stockholm, Schroeter of St. Petersburg, Messrs. Fellner & Helmer of Vienna, and Seeling of Berlin. Absolute perfection has scarcely been reached, but something very near it. Maybe we cannot hear in some parts of the auditorium of the beautiful Vienna Hofburg Theatre, or maybe we complain of the heavy interior decoration of the so-practically arranged Buda-Pesth Opera House; but taken as a whole, and as a whole it is that architects must learn to judge, there are few buildings, old or new, that can be said to surpass the great continental theatres of to-day. The pessimist or revolutionists of Mr. Pite's school may say differently, but I am unfortunately an admirer of this age of architectural variation and adaptation, in which, to my mind, an immense amount of originality and true art is shown. I am fully convinced that the good examples of the work of this period which are bound to live will not be considered the mere copies so many of the discontented are afraid of. Of course there is many an eyesore among the modern theatres abroad, and many that do not fulfil the requirements of their owners; but in what class of building, and at what period have there not been some failures?—though we do not like to think so when gaping at some monstrosity labelled old, very old, say even real Greek or real Roman. Where the conception, the practical arrangement and the architectural rendering are expressive, serviceable and pleasing to a cultured majority, perfection is not very far off. I should be pleased to hear why Messrs. Semper and Hasenauer's Hofburg Theatre, of which illustrations are shown, is not very near perfection, and what more, full of originality.

General.

Taken generally, continental theatres are oblong in plan. In some cases the front is rounded, showing the outline of the auditorium, and in some instances there are wings on either side of the main block. The audience is always above street level, and the building is always distinctly divided into two parts—the so-called front and back of the house. As the modern continental stage requires great height, the grouping of the block generally shows this part of the building taken up separately as the prominent feature. There is seldom any attempt nowadays to put the whole of the building under one roof. Continental theatres all show symmetrical planning and ample dimensions, and there are few to my knowledge that appear structurally badly built. The buildings have all been put up under watchful permanent authorities, who are guided by well-considered regulations and have ample powers. They have not been subject to the fads and fancies of ever-changing popularly-elected bodies. They have also nearly all been erected by men who have a horror of running the risk of a repetition of the Ring Theatre fire. Architects have but seldom opposed safety legislation or tried to avoid its requirements. The so-called front of the house is generally distinctly palatial in feeling, whilst the back has always a thoroughly utilitarian look about it. I would here point out that I hold many of the municipal and subscription theatres to be too palatial and too luxurious for the audiences they are intended to hold. I do not want to pick out any one town or country, but I must really say that there are some very luxurious playhouses where the ill-dressed, ill-kempt and often vulgar audience looks entirely out of place. Why give such audiences surroundings that do not suit them? Surely a building can be simple and yet beautiful. Architects should not forget that a badly attired crowd can spoil their finest colour study, whilst even Hungarian and Polish magnates in full national attire will lose much of their splendour in inappropriate though perhaps quite classical surroundings.

Site.

There are few modern theatres abroad that do not stand perfectly isolated; public squares are the favourite sites. Isolation is undoubtedly necessary where the maximum safety against the risks of panic and fire is desired, but I would point out that an audience can be already well cared for if only two sides of the block face thoroughfares. Symmetrical planning is to my mind the first necessity for a theatre that is intended to be a safe one. The position of all passages and staircases on outside walls is the second essential, and the possibility of approach to every part of the building from outside is the third. Now all this is only possible where at least two sides of the block are perfectly free. To have the front of the site as well as the two sides looking on the thoroughfares is of course a great advantage, but to have the main front, one side and the back open would be far worse than to have only the two sides free. Remember the plans of the Ring Theatre, the Exeter Theatre,

and other scenes of fearful catastrophes. Legislators abroad require complete isolation, but I will not go so far for London. Our own by-laws, however, only say, "That is not quite sufficient." The two sides of the building as seen when facing the stage must at least be free from end to end, and that generally means more than half the boundary. I am not going to dwell on the many technical advantages of isolation so ably described in Mr. Woodrow's paper. The risk of panics through accidents in neighbouring premises, the advantages of cleanliness, and the facilities for the working of the firemen in case of an emergency, are points which should not be underrated. The safety of human life is a major interest, and the safety of property of minor consideration. As soon as the audience are out of the theatre, treat the building according to the custom of the country. It is not usual in this country to protect neighbours from one another to any appreciable extent, or to prevent a large risk that catches fire from being entirely gutted by enforcing such protective measures as those required by continental fire Acts. This may be wrong or right; I hold it to be wrong, but in any case, why make an exception to theatre property? In a town where timber storage is allowed next to valuable warehouses, why protect, say, a public house from the fire risk of a neighbouring stage? Abroad, of course, all this is different. The requirements for the isolation of theatres are no more stringent than the various measures in force for other classes of property.

The chief advantages of placing a theatre in an open square are the greater facilities for the approach and distribution of crowds, and easier manœuvring for the fire brigade in case of need. Where buildings are really public institutions it greatly adds to their dignity to be well situated. By-the-by, speaking of the position of theatres abroad, I would observe the great importance the owners of private theatres attach to first-class and conspicuous sites as an advertisement for their enterprise. They will go to any length to have an open site.

Approaches, Entrances and Exits.

Great care is taken on the Continent to facilitate the approach of the audience. That part of the audience which arrives by carriage is nearly always able to enter the building under cover, without being disturbed by the inquisitive or having to feel the effects of inclement weather. The patrons who arrive on foot generally have numerous entrances from at least two sides of the building. Great care is taken abroad to avoid draughts by having double or even treble sets of swing doors. Excepting in the grandest houses, all playgoers must pass the main vestibule, where the box-office is situated, and this also refers to the visitors who take unnumbered seats. Speaking generally, there are few seats abroad for which one cannot book in advance, and hence the number of tickets sold on the night of the performance is comparatively small. There are also very few unnumbered seats, so that the first come, first served system of procuring seats at the last moment does not allow the same scope to the energetic as in this country. If a queue has to be formed at all of an evening for tickets, the expectant of all classes generally pass the same counter to ask for whatever kind of seat they may require. Two counters to the same box-office are an exception, and separate box-offices for different parts of the house are only very rarely found. Where a queue has to be formed the crowd is generally well cared for and put under cover in an outer lobby or passage, and much attention is given to the arrangement of barriers so that there need be no unnecessary fatigue.

The symmetrical planning of the Continent allows for the nominal division of the building into "The Right of the House" and "The Left of the House," as seen when facing the stage. Tickets are issued for the right and left of the auditorium, and all passages and staircases will be found to be labelled on this principle. All passages and staircases can be used freely, and the visitor naturally takes the route which leads him quickest into his seat. Besides facilitating the finding of seats, the audience thus gets to know the nearest exits at their disposal in case of an emergency. The system common in London, which only allows for one approach to each tier, whatever the number of exits may be, is radically wrong as far as the safety of the audience is concerned, although no doubt the theatre lessee will be able to run his house with a smaller staff of ticket collectors this way. Though all staircases and passages are approached from the main vestibule, they all have separate exits leading direct into the open without the vestibule having to be passed. In this way but few of the audience would pass the vestibule in case of a panic. By-the-by, clear planning is favoured abroad as distinct from intricate and tricky planning, and this even at the cost of much valuable space. It is considered all-important that the dullest and most excited persons should be able to remember the route by which they reached their seats.

Passages.

One of the chief features of continental planning is the broad passages and corridors, and the fact that with few exceptions these passages run round the two sides and back of

the auditorium. The continental theatre-goer has generally to give up his wraps before taking his seat, and it is a favourite plan to provide long counters off the passages behind which there is ample storage room. The counters should, however, be recessed so that they do not obstruct the passages. I would here remark that the storage of hats and coats is very important for the safety of the audience. A wrap or a stick dropped during a panic may cause the first fatal stumble. Though it is difficult to regulate this matter, the prohibition has been enforced in several continental countries, and where ample cloak-room accommodation has been provided, the custom has generally become very popular. As to the actual storage of the apparel, the bin system is the best. As to the cloak-room tickets, the plan of allowing a bin for each seat and then giving the bins the same numbers as the seats has been found very practical. Speaking of cloak-room accommodation, I will at once add that the ladies are by no means so particular abroad as to their retiring-rooms as in this country, and there is no objection to their being in a conspicuous position. The position of lavatories off main passages which we would consider faulty is hence also quite *en règle* abroad.

As you will see from these plans, the passages generally have direct light, and are well ventilated. This is essential for the audience, to my mind. By opening or breaking the windows on the passage, the noxious gas and smoke which has been known to frequently find its way from a burning stage to the open doors of the auditorium can escape. A crowd will always feel safer as soon as it is near the open air, and in case of the lights going out the window openings even on a dark night—more especially if there are some lamps in the streets or courtyards without—will give some light, and with it more assurance. Here I would at once suggest that where passages or staircases look on to the open a few strong lights outside in no way connected with the service of the theatre will form the best kind of emergency lighting that can be provided. Of course, there must not then be any blinds or shutters.

Staircases.

The grand staircase, the great feature of the old continental theatre, is gradually disappearing abroad, and where we yet find it its *raison d'être* is generally partly lost through there being quite sufficient staircase accommodation provided independent of its existence. The grand staircase is recognised as dangerous for the rapid exit of the crowd, as its pretension and architectural treatment generally necessitates arranging it in broad flights. Flights of staircases which allow more than four persons to ascend abreast create, as has been often explained, a danger to fall or to stumble. Of course there is the make-shift of a light iron railing running up the centre of a broad flight and thus affording a hold, but I am afraid these iron bars will generally spoil the design of any staircase. At Copenhagen I constantly came across this class of railing, as the theatre regulations require the possibility of a hold for every person ascending stairs. They always looked atrocious.

The continental architect of to-day has three systems for the arrangement of his staircase. I will call them the central system, the radial system and the corner system. The former allows of a grand central staircase, generally without direct light, or at the most a top light and hence without the possibility of natural ventilation. On either side of this grand staircase the minor stairs are grouped. The Stockholm Theatre, as you will see, and the Frankfurt Opera House are examples of this system. The radial system allows of the arrangement of the staircases in a row, concentric with a back wall of the auditorium. The staircases to the first tier are then generally on either flank and are frequently treated as minor grand staircases. The Dresden Opera House and the Odessa Municipal Theatre are examples of two variations of this system—the one with direct lighting, and the other without. The Lessing Theatre at Berlin is an example of the former system: as you will see, the staircases have simply been grouped on either side of the main vestibule, so as to have direct light. There is no grand staircase, and the stairs leading to the best seats only show a slightly superior architectural treatment. Staircases in the same way as passages should always have windows looking into the open. The advantages of the outside emergency lighting, as well as the other points to which I have referred when speaking of passages, hold good as regards the advantages of having staircases on outside walls.

Speaking from experience, I consider that the more persons in sight of one another in case of an emergency, the better the behaviour of the individual. I would hence suggest that where possible stairs should be so arranged as to allow a maximum view. I do not approve of the building up of surrounding walls of staircases in the way that limits the view. Being penned in and descending into a well, if I may call it so, creates a feeling of uneasiness.

As an architect, I certainly much regret the disappearance of the grand staircase. This feature lends itself particularly well to an elaborate treatment. I hold it should be retained at any cost in the court and municipal theatres, which, as I

explained, frequently serve as assembly halls. There must, however, be sufficient staircase accommodation independent of the grand staircase, and no doubt some day a skilful architect will find some pleasing way of overcoming the dangers of broad flights. The radial system of staircases is rapidly gaining ground abroad, and I consider it the best for the quick distribution of an audience. It would, however, be difficult indeed to combine this system with the arrangement of a grand staircase. You will see in the plans of the new St. Petersburg Opera House an attempt is, however, already being made to combine the two.

Foyers, Crush-rooms.

Perhaps the feature of a modern continental theatre is its foyer or crush-room. We find what I will call the "hall foyer," the "group of rooms" foyer and the "promenade" foyer. The first is generally a spacious rectangular hall situated over the main vestibule. It serves as the assembly-room for the patrons of the better seats, who stand about and chat during the long entr'actes mostly allowed abroad. The hall is often used for the receptions I spoke of and frequently also for concerts. No concert would, however, be given at the same time as the performance on the stage, as the staircase and passage accommodation would not be sufficient. Where there are groups of rooms the smaller ones are, as a rule, provided with chairs and lounges arranged drawing-room fashion, whilst the larger one is used as a kind of miniature promenade, the visitors walking round in a circle. This becomes very monotonous. Foyers arranged on these lines cannot well be used for concerts, but small receptions can of course be held in them. The Schwerin Theatre affords an example of the large "hall" foyer. The Buda-Pesth Opera House shows a set of crush-rooms. The "promenade" foyer is, to my mind, the most satisfactory one; it best fulfils the requirements of those who wish to easily stretch their limbs and meet their friends between the acts. A stroll will greatly refresh the playgoer, especially if he is attending a lengthy Wagner opera or a Shakespearian play. The stroll must, however, not be a monotonous one. There must be a change of scene. The long narrow foyers of the Paris or Vienna opera houses are already very satisfactory, but the curved promenades of the Dresden Opera House, the Vienna Hofburg Theatre or the Odessa Theatre stand first. The curved foyer goes hand in hand with the radial staircase system I spoke of. Most of the curved foyers have a roomy lobby at either end, where one can step aside for conversation or to watch the scene without creating a block. Speaking of the scene, I would here remark in the countries I am speaking of the audience unfortunately is not as a rule "dressed" to see a play, not even the patrons of the best part of the house. This should be taken into consideration when decorating the foyers.

The foyers abroad nearly all have balconies or terraces connected with them, and these are much used in the summer. Doors from the foyers generally lead directly on to them, and the absence of any lobby has unfortunately caused many a chill. I consider the advantage of being able to step out into the open very great, and this not only for the refreshment of the audience, but also in case of emergencies. Great care should, however, be taken to prevent draughts. In court theatres there is often a small central balcony or open loggia. I spoke of royalty using their playhouses for ceremonies. It is necessary to have some suitable, prominent point from which any demonstration outside the building can be duly acknowledged.

I must now refer to the refreshment-rooms or bars in connection with the crush-rooms. They are of the most harmless kind, and would even meet with Mrs. Ormiston Chant's full approval, as the contractor need generally only keep a good store of lemon squash, ice creams and cake to fully satisfy his customers. The liquor license for the refreshment-room exists, but it is scarcely made use of. Light German beer can be had, but its consumption is comparatively small. The bar, as a rule, is generally only a kind of provisional table at the end of the crush-room, around which perhaps a few tables and chairs are arranged, as in a confectioner's shop. There is one thing I would here remark—I do not remember ever having seen a refreshment served in the auditorium. If refreshment is wanted the visitor is expected to leave his seat.

Auditorium.

The principal feature of a modern auditorium abroad is the absence of any boxes in our sense. The balcony arrangement has almost become universal, and though there are nominally boxes which allow parties of four, six, or more persons to form a group for themselves, they are not shut-off pigeon-hole fashion as formerly. The ante-room for the box is also fast disappearing. The only boxes, in our sense, are generally the large open ones on either side of the proscenium opening, in what I will term the great proscenium frame. These are generally reserved for dignitaries or distinguished strangers. The other so-called boxes are simply formed by dividing up the balconies with low

partitions and giving each division its own door. A compromise arrangement will be found in Semper's work. The partitions between his boxes are carried up, but are so cut away as to prevent the disadvantages of the pigeon-hole system without completely destroying all privacy. I show an illustration taken from one of the working drawings of the Dresden Opera House.

The large boxes on either side of the proscenium to which I have just referred would, in the case of a court theatre, be reserved for royalty, but the court would also have a large open central box on the first tier. The side boxes are used for private visits and the central box on State occasions only. These grand court boxes are frequently most curious mechanical contrivances, which can be enlarged or made smaller at will. They generally cut through two tiers and are covered with a baldachin. I might here remark that the auditorium is frequently turned into a ball-room abroad by putting in a temporary parquet floor on tressels level with the first tier. At times this floor is even extended right over the stage, which is then decorated as a kind of bower. Small courts give their name to the theatre if the palaces do not afford sufficient accommodation. As a rule the theatre is, however, only the scene of so-called subscription balls for charitable purposes, royalty gracing the fête with its presence and serving as an attraction. But few architects have been able to design an auditorium so that the temporary floor does not make it appear a architectural monstrosity. The only one, in fact, that I remember looking well as a ball-room is in the old Berlin Opera House. I remember a subscription ball there when old Emperor William was celebrating his ninetieth birthday. The auditorium really looked better with the temporary floor, and the stage was a perfect piece of floral decoration.

When speaking of the arrangement of the auditorium abroad must point out the ample seating and gangway accommodation provided, and the great care that is always now taken to give every two or three rows of seats its own door. Herr Seeling, I believe, shows the best example of safe seating in the Halle Theatre. Here I must just allude to the advantages of school children learning to leave rooms on the "follow-my-leader" principle. Given a well-planned theatre, the inductive exit of the audience on the lines they learnt as children would do much to insure safety. I remember a notable demonstration of the advantages of follow-my-leader given by the late chief officer of the Berlin fire brigade at one of the theatres in his city.

He had the right half of the auditorium packed full with schoolmen; he then went into a box and gave a signal for them to stampede. None of the men had been on the same ground before, but they were all used to leaving their dormitories smartly and running down the staircases at their fire stations in good order. Well, gentlemen, they were out before one could literally say "Jack Robinson." It just took eighteen seconds to clear out about four or five hundred men. The same experiment was tried with 1,400 school children at the Forms Theatre, and they were out of the auditorium in forty seconds.

Referring to the construction of the auditorium, I would only point out that there is no such excellent cantilever work abroad as is to be found in our Palace of Varieties. The latest development of iron and steel construction abroad shows the surrounding wall of the auditorium entirely of girders and plates. This is on account of the large number of flues and ducts that have to be found room for in continental theatres. If you will examine the work in the drawings of the Hofburg Theatre you will find an example of this system. Of course, an auditorium of this construction ever does get well alight means the immediate collapse of the whole structure.

As to the architectural treatment of the auditorium, the ceilings are no longer designed so as to appear to be resting on nothing, but are visibly carried, preferably by Caryatides. The heavy columns in the French theatres are things of the past; almost invisible steel pencil columns without any architectural treatment are generally used where supports are necessary. The decorator and upholsterer are no longer permitted to use the stereotype red and gold. Blues and rich yellows are finding favour in the upholstery, and white picked out with gold in the walls and cornices. The ceilings are kept quite light, preferably white, picked out to match the upholstery. As to the furniture, the tip-up seat with a small side arm has almost become universal. It is well padded in the better parts of the house, but a bent-wood is a favourite for the cheaper seats. As in buildings abroad are only licensed to hold a certain number of seats and this condition is very stringently enforced, benches which can be crowded are of no use to the manager even in the cheap parts of his building. As I said, hats and coats are mostly left outside, so that no provision need be made for these. As to the numbering of seats it is always in plain block letters, and even numbers to the left and right of the house respectively.

(To be concluded.)

IRISH ART.

A LECTURE on Irish art, as seen in Irish crosses, was delivered by the Rev. Denis Murphy, under the auspices of the local branch of the Archæological Society, in the Town Hall, Waterford. The lecturer said he would ask two questions which he would strive to answer satisfactorily, for there might be some amongst them, he would say without any breach of charity, who might not be acquainted with these matters, having other and more important duties of life which kept them fast in their ordinary avocations. He would ask, first of all, Is there such a thing as Irish art? The answer was, There is such a thing as Irish art; as well defined as Grecian, Persian, Egyptian or Moorish art, or the art of any other nation in the world. He claimed for Ireland that it was the cradle and the source of the beautiful work of which he would show them specimens that evening. There were Celts in Wales, Celts in Cornwall, in Brittany and in France. He would ask what has Wales, Brittany or Cornwall done for this special style of art? He would go no further than Scotland. What they have done in this way they have borrowed and taken from Ireland. With regard to Scotland it would be a rash statement if he had not the authority of Dr. Anderson, curator of the Edinburgh Museum, for the assertion. Dr. Anderson says that the source and cradle of this art is Ireland and Ireland alone and other authors, like Weston, in later times, state positively and without any kind of doubt that Ireland is the cradle and source of this art. This Irish art may be coveted by others but not originated by them. Gothic art is produced by leaf-work. There was nothing of that kind in Irish work, although they had nature exuberant in many ways. But, instead of that, they had serpents introduced in the most curious fashion, with all manner of creeping things and human beings, sometimes twisted and gnarled together in a most curious and extraordinary way. If ever leaf-work is seen, except, perhaps, the shamrock, it is Gothic, it is post-Norman—anything but Irish work. The second characteristic of this work is its amazing variety. The first specimen of this kind of work he would show them would be the title of the Book of Kells. It was called the Book of Kells because it was, most probably, written by St. Columba, who lived in Iona a great part of his life. It is the most beautiful page of the most beautiful book in the world. They would see it to-night without its colours, but it was as beautiful and as perfect as when it was first written in the year 600 A.D. How the human eye, unaided, could have introduced such amazing and such perfection of minuteness was to him and others a great mystery. There was no simple twist or turn that had a flaw; no failure of any curve or line that should be parallel. Mr. Weston counted on one of the pages 158 lines within the space of 1 inch. This extraordinary beauty, delicacy and perfection of details is singular and peculiar, and it belongs singularly and peculiarly to Irish art. Illustrations of nearly a hundred Irish crosses were exhibited.

ARCHITECTURE AND INDUSTRIALISM.

A MEETING of the Northern Architectural Association was held on the 12th inst. in the Art Gallery Lecture Room, Newcastle, when a paper by Mr. H. Barnes on "The Economies of Architecture" was read. The paper stated there were two distinct periods, each marked by a well-defined growth, perfection and dissolution. They were the Classic and the Gothic. What were the conditions which, in the fifth century B.C., and in the thirteenth century A.D., gave opportunity and provided scope for the highest expressions of architecture the world had yet seen? And why did they not exert their power to-day? The hope of any true growth had almost died out, and they had nearly persuaded themselves that the *summum bonum* of all architecture was to rigidly adhere to and successfully imitate some bygone style. One of the answers given was that the existing methods of construction had been played out. The writer thought they could hardly accept that. Along certain lines they had attained great perfection, but there was nothing to show that it was impossible for them to develop on other lines. A second answer was that the public controlled art and that the public taste was depraved. That was far from a final solution. The Athenian architecture reached its perfection under the most democratic and complete control of affairs by any people the world had yet seen. But even admitting that the public taste was depraved, how was it that this depravity was considered sufficient explanation for a state of architecture to which the last days of the Roman Empire alone could offer a parallel? The paper proceeded to draw attention to the circumstances which evoked in a high degree the sentiment of nationality in the height of the classic period of Greece, and the deep religious feeling in the best days of the Gothic period. With this was contrasted the different state of feeling produced by the keen industrial competition of to-day. The writer concluded from these historic examples that the

only hope for architecture was the revival of her two great inspirers—social and religious feeling. It was necessary that industry should be so administered that it should cease to be a source of national discord and become a fruitful source of social and religious unity. How this was to be done was another story, and not part of his paper.

THE RUINS OF NIFFER.

THE United States Minister in Constantinople, reporting recently to the Department of State on the exploration of the ruins of Niffer, near ancient Babylon, mentions that the work is undertaken at the cost of an association in Philadelphia, which was formed in 1888 and is called the Babylonian Exploration Fund. Some 200 Arabs are constantly employed under the direction of Dr. Peters, of the University of Philadelphia, and the Minister says that "in the number of tablets, brick, inscribed vases and in the value of the cuneiform texts found, this American enterprise rivals, if it does not excel, the explorations of Layard at Nineveh and Rassam's excavations at Abu Habba." Dr. Hilprich, also of the University of Pennsylvania, who was originally connected with the exploration, remains in Constantinople at the request of the Turkish Government, to translate the inscriptions and arrange the tablets and other objects excavated. Many tons of these, including tablets, vases, inscribed brick and sarcophagi, have arrived at the Constantinople Museum, and the Sultan has promised that Pennsylvania shall receive one of all duplicate antiques. So far, 20,000 tablets of clay and stone have been discovered, on which are inscribed promises to pay, deeds, contracts and other records of public and private events. "About 150 Hebrew, Arabic and Syrian inscribed bowls have been dug up. These are more than all the museums in the world possessed before. They have also found hundreds of Babylonian seal cylinders. About 1,000 vases of alabaster, marble and other stone have been discovered, with votive offerings of lapis-lazuli, magnesite and agate. Many hundred vases, toys, weapons, instruments and household objects in iron, bronze and clay were discovered." The Temple of Bél is being dug out, and the Minister says that when finished it will be the first Temple of Bél ever systematically excavated. The excavation was carried down 42 feet below the foundation of the immense temple.

THE GHIZEH MUSEUM.

SPECIAL measures have been adopted to diminish the danger of fire occurring in the Ghizeh Museum. The Public Works and Police Departments have for a long time been considering what steps were best for this purpose, and the result is the completion of abundant water supply, with a special canal and a new system of hydrants round the building, and a complete system of electrical communication from all parts of the building to the fire-brigade station and Ghizeh waterworks. The museum authorities have removed all perishable objects into the Selamlık, which is fireproof, and this portion of the building is now separated from the remainder by iron doors. These precautions, together with certain changes in the composition of the special fire brigade attached to the museum will minimise as far as possible the damage to the priceless collection from fire. In March next the Government will have to select from amongst the numerous plans expected to be sent in by European and American architects the one most suitable for a new building to be erected on a site already appropriated within easy access from the city, and Egyptologists may then feel assured that the Government spares neither pains nor money for the preservation of its collection of antiquities and for affording facility for their study by scientists.

THE ROMAN VILLA AT DARENTH.

AS was anticipated, the exploration at the site of the settlements at Darenth has demonstrated that the buildings extend far beyond the apparent limits shown by the first diggings. The area to be enclosed for excavation will be doubled in size, as the foundations have been traced for some distance beyond the present fence. The feature that excites most interest is the elaborate system of warming by heated air, and in several places the arrangement of flues is in a perfect condition. On the east side is a small room about 12 feet by 7 feet, in which the rows of piles, each formed of tiles laid one upon another, are clearly defined. Upon these piles the floor of the room rested, and the hot air from the adjacent furnace was introduced into the space beneath the floor and circulating round the piles thoroughly warmed the room. Not only was the floor warmed by the heat beneath, but the flues ran up the walls also, perhaps to warm an upper floor, as well as to keep

the walls of the lower rooms warm. Like many other Roman villas in Britain, this one was provided with glazed windows and one large pane has been found in addition to many fragments. The most imposing room yet uncovered is the large bath, on the west side of the house. It is some 3 feet below the general level of the other rooms, and measured originally about 50 feet long by about 20 feet in width, with a descent of cemented steps at one end. Although no pavements of ornamental design have yet been found, the villa was evidently the property of some man of fairly good means, from the painting of the walls and the solidity as well as the size of the structure. A vast quantity of animal bones have been turned out by the men, including a number of worked deer-horn objects, apparently picks, handles of tools, &c.; but the only object that can be called a work of art is a small bronze plate with the design filled in with coloured enamel, which may well be of native manufacture.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

AT the last meeting of this Association, the president (Mr. Wm. Henman) in the chair, and present Messrs. Bidlake Harrison, Scruton, Edwards, Percival, Prichard, H. Buckland and others, after the election of new members, Mr. F. R. Farrow, F.R.I.B.A., of London, read a paper on "Preparation for the Examinations held by the Royal Institute of British Architects." He said for the future all desirous of attaining the distinction of an associate of the Institute would have to pass through three progressive stages of examination, of which he gave details, together with hints as to the best books to study. The final examination of the new course had not yet been held, so that they were rather in the dark as to what form it would take, but one thing was certain, that it would be much more difficult than the qualifying examination in the past, as the intermediate examination must be considered about equivalent to that; and he advised students to make the most of what Mr. Bidlake and the Birmingham Association had to teach them, and said he did not doubt that if candidates would take advantage of these and other facilities provided for the education of architects in Birmingham, they would have no difficulty in getting through. Thanks were voted to Mr. Farrow for his paper.

GENERAL.

The Italian Government have offered a prize of 120 sterling for the best essay on the technique of painting frescoes, encaustic painting, distemper and oil-painting, with suggestions for the preservation of ancient paintings. The essays may be written in English, and foreigners may compete. Manuscripts are to be delivered to the Minister of Public Education not later than June 30 next. The essays will be adjudged by a special commission assisted by scientific experts.

A Banquet is to be offered in Paris to M. Puvion de Chavannes, to signalise his attainment of his seventieth birthday.

An Exhibition has been held in the Public Library, Cologne of maps and other works relating to Mercator, who died at Duisburg in December 1594.

Mr. B. P. Shires, in concluding a course of lectures on architecture at Plymouth, referred to the late Mr. Gribble as a local architect, and his two principal works, the Oratory and the Armada Memorial.

The Earl of Derby intends to renew the monuments and brasses of the Stanley family in Ormskirk Church.

Mr. Wm. Taylor, president, at the meeting of the Royal Scottish Society of Arts, has called attention to the apathy which was displayed in connection with their business meetings. For himself and the other office-bearers, he said, he had to thank the Society for the confidence bestowed upon them, but when he mentioned that the office-bearers met and elected themselves it would show that the interest taken in the business by the Fellows was not great.

An Exhibition of work by members of the Sketching Club of the Manchester School of Art has taken place in that city. The pictures are nearly all in water-colour and are mainly landscape.

Mr. Ernest Runtz is deserving the utmost credit for the very effective manner in which, as architect, he has carried out in the short period of three months the rebuilding of the Pavilion Theatre, Whitechapel Road, E. The house is spacious and well planned, while the decorations are fully equal to some of the best of the West End theatres. The façade, a beautifully designed structure built by Messrs. Doulton & Co., of terracotta, is quite dwarfed in comparison with the handsome spacious interior, and the convenient appointments for visitors and artists, and there is no possibility of a complaint of insufficiency of exits being raised, as these are abundantly provided.

The Architect.

THE WEEK.

MANCHESTER has lost one of its most prominent architects by the death of Mr. JAMES MURGATROYD. To his firm—MILLS & MURGATROYD—many large works were entrusted, the most important being probably the Royal Exchange, which forms a prominent feature in Manchester and is known to all visitors. Mr. MURGATROYD was an active member of the committee of the Jubilee Exhibition and, we believe, was mainly responsible for the arrangement of the architectural section. He was also of great service in aiding in the arrangements for the technical school, and to obtain information he visited several of the technical schools on the Continent. Mr. MURGATROYD possessed much energy and business capacity, and there is no doubt he was one of the most efficient citizens in Manchester.

It is to be hoped we have heard the last of the Kensington Court case, which is not creditable to the tact of the London County Council. It was known when the proceedings were commenced there was uncertainty whether the building abutting on two streets should have the height determined by the wider or the narrower of the two, and it had been decided to apply to Parliament for authority to have the height calculated according to the wider street. But because the parties connected with the houses in question had, according to their legal rights, adopted the height of Kensington as a standard instead of the narrower entrance to Kensington Court, no effort was left untried by the Council to put them to inconvenience. The amount of ratepayers' money expended to bolster up a principle that the Council had doomed to extinction has been large and the outlay has only served to show with what ease despotic acts can be executed. On Saturday the case, which had been remitted to the magistrate at the West London Police Court, came up for settlement, and he was asked to impose substantial penalties for sixty-seven days, namely, from December 31, 1893, to March 7, 1894. Mr. CURTIS BENNETT, in giving his decision, called attention to the new Act consolidating the Building Acts, which had been obtained by the County Council since the commencement of the proceedings. He said the Act really dealt with the question raised in the case. The Judges had agreed that it was a hard law, and Parliament had apparently come to the same conclusion, for in the Act it was provided that, where the building was on a corner plot and abutted on two streets, the height should be regulated by the wider of the streets. That made the law clear, and removed the hardship. He thought, under the circumstances, that a penalty of 3s. a day would be adequate. It was a case in which some arrangement might be come to between the owner and the County Council. The owner of the buildings was ordered to pay 10*l.* 1*s.* with five guineas costs. The punishment is not as grievous as the County Council desired, but it is difficult to see what real advantage the inhabitants of the Metropolis have gained by the imposition of such a penalty or by the expensive proceedings which have had so insignificant a result.

THE parties in the building case, BRITTON v. VEALE, that was heard a few days ago in the Queen's Bench Division, do not appear to have profited by departing from the established custom, and allowing an official referee to decide on their differences instead of the architect for the building. Mr. VEALE, the defendant, owned land at Lfracombe, and recently erected an hotel on his property at a cost of about 10,985*l.* The original contract was for 14,75*l.*, but as the works were progressing the advantages of increased accommodation were recognised and additions were undertaken. The owner was not satisfied when the building was completed, as he believed there were considerable omissions from the contract. Accordingly the plaintiffs, Messrs. BRITTON & Co., in January found it necessary to bring an action to recover a balance of 1,087*l.* The case was referred, and the amount was reduced to 552*l.* in the report of the official referee. Mr. VEALE objected to the report, mainly on the ground that the referee had refused

to enter into any matters which might have been brought before the architect and had been neglected, which, it was said, shut out most of the defence, though, in truth, both parties had tacitly agreed to discard the architect, neither of them having appealed to him. Mr. VEALE's counsel urged that, as in fact the parties had not appealed to the architect, it was for the referee to enter into the matters in dispute and decide them—the omissions, for instance, which were serious—instead of which he had virtually avoided determining them, and had thus, in fact, excluded the employer from his defence. Because the employer had not appealed to the architect, was he to pay for work not done? There were manifest omissions—for instance, of concrete in the foundations, of drains, of water-closets, &c. For all these the employer was to pay, merely because he had not appealed to the architect and got his decision. The defence had, in truth, never been gone into, and he asked the Court, therefore, to send the case back to the referee. Baron POLLOCK said the architect had power to decide all points in dispute between the parties who, however, "gave him the go-by," and neither of them resorted to him. The case, therefore, was sent to the official referee, who entered into all the matters in dispute and heard evidence, only taking the architect's estimates as to prices and values. There appeared to be no ground for disturbing or sending back the report, and the application must be refused with costs. With that judgment Mr. Justice GRANTHAM concurred. An application for leave to appeal to the higher Court was refused. In settling his next building contract, we hope Mr. VEALE will remember the lesson he has received, for he will find it is economical to allow his architect to determine all claims.

THERE can be no doubt that a great many of the tall chimneys throughout the country are a source of danger. In the last gale, while jerry-built houses defied the storm, many factory chimneys succumbed. Apparently there is no authority to look after structures of the kind, and there is no code of rules which is accepted as applicable to them. The defects are sometimes so notorious, the coroners cannot be silent about them. On Monday, in Keighley, at an inquest on a victim who was crushed by the fall of a mill chimney which was partly attached to a building, and was of the same section throughout, the coroner remarked that a fixed side is a danger to a chimney. That was demonstrated in a very thorough investigation that was made at Cleckheaton or Heckmondwike, and Mr. WAUGH distinctly said that a fixed side was a danger in that case. The coroner could not well appear to be one-sided, and he said it was a very wide question, and very possibly the gale was of such violence that it might have happened in any event. The jury found that death had occurred by misadventure.

AT Leeds on the same day another inquest was held. The chimney which was the cause of the accident was described as always rocking when there was a great wind. The owner considered that probably the chimney was rocked by the wind, and that before it could get back to its original position it was met by another gust of wind, which broke it. If the chimney had collapsed at the foundations the loss of life and damage to property in the neighbourhood would have been very serious. A chimney, he considered, might rock and still be safe. There are, however, many degrees of rocking, and it is time that an examination of existing structures by specialists should be enforced throughout the country.

In preparing their architects' and builders' diaries and date-indicating blotting-pads for the New Year, Messrs. HUDSON & KEARNS have wisely acted on the principle of letting well enough alone. Their productions have acquired so much success during several years, innovations might not be advantageous, for the use of the diaries has become part of an established system in well regulated offices, and nobody cares to abandon forms with which they have become familiar and the utility of which is uncontroverted. We therefore recommend Messrs. HUDSON & KEARNS's aids in business to our readers with satisfaction, for it is well to find that one class of annuals has not degenerated.

ARABESQUES AND GROTESQUES.

THE distinction between ornament made up of arabesque and of grotesque elements is not universally accepted. In many cases a *motif* that would be described by some as arabesque would to others exemplify grotesque. LITTRÉ, who always endeavoured to be precise, defined grotesques in the first place as "arabesques imitated from those which were found in ancient edifices buried underground," and, secondly, as "figures which excite laughter by going beyond nature, or which counterfeit nature in a bizarre manner." The meaning he gives for arabesque is "ornament which is made up by the interlacing of leaves, flowers and animals." Both words arose out of associations, and are consequently inadequate. Eastern ornament, with its interlaced and lifeless conventions, might give rise to "arabesque," although the word would inadequately describe Renaissance arabesque in which animal life is freely introduced. In the same way the Roman and Greco-Roman ornament, which was discovered in grottos or buried chambers, might be confounded with one variety of it, and the grotesque be accepted as the bizarre.

It would be an advantage if the two words, in common with many used in speaking and writing about art, could be set aside and supplanted by others which would be more rational. They are inconvenient in giving rise to erroneous notions. For it is an error to suppose that the Eastern or Arab treatment of ornament corresponded with Roman or Renaissance, and it is, moreover, wrong to assume that bizarre or unnatural figures are the genuine elements of interlaced ornament.

That figures which were not imitated from anything existing in the universe have been used as long as men have been employing ornament is unquestionable, and it was from Roman rather than from Egyptian or Assyrian examples that modern types of grotesque were derived. It is evident, however, that the best judges in Rome were at first opposed to the exercise of invention in that way. There was nothing which to HORACE appeared more absurd than one of those decorative compounds. Who could refrain from laughter, he asks, on seeing a representation of a mermaid or of a figure made up of a human head, the neck of a horse, and winged with a variety of feathers? He expressed the good sense of the cultivated Romans. VITRUVIUS, who was apparently a contemporary of HORACE, was no less emphatic in condemning the practice of introducing mongrel figures. In his seventh book he says:—"I cannot tell by what caprice it is that artists no longer follow the rule of the ancients, to take for their models only real things, for now they paint on the walls extravagant monsters instead of veritable and regular figures. For columns we have bundles of reeds, with contorted heads, or plants with the leaves awry and twisted into volutes. We see candelabra which sustain little villas, with branches of trees on which figures are seated. Others have branches from which flowers spring, with small figures issuing from the buds, some with human faces, while others have heads of animals. All these things are contrary to nature, but while they are approved there is no chance for anything that is good in art. For how can reeds be able to sustain the weight of a roof, or a candelabrum carry a villa and so on? But nobody rebukes such impertinences or asks whether what is represented is a possibility? For my part, I maintain that a painting should not be esteemed unless it represents the truth, besides being rational in the composition, while everything is excluded that would shock good sense."

VITRUVIUS and HORACE applied severe rules of logic to decoration. It was not perceived by them that art does not need to be as correct as mathematics. They ignored the advantages which grotesque figures possessed in allowing an almost infinite variety of contours.

On the other hand, many antique Romans must have found a relief from stern care when they gazed on decoration which might be supposed to have been painted by children for children. The numerous wall-paintings which are found in Pompeii, where amorini are depicted as engaged in chariot races, festivals and ordinary occupations, or in which pigmies are the actors, the incidents with baccantes and centaurs, the comic figures and caricatures, are a revelation of lighter moods in Roman breasts which it was necessary to gratify. They were disciplined until they were hard

and cruel, but nature could not be withheld from asserting its rights. The man who designed the scene in the studio of the portrait-painter that was discovered in the Casa Carolina must have calculated on the prevalence of a sense of humour in Pompeii. Critics like VITRUVIUS could not esteem it, but that sense was not an unmanly quality, and a moralist would be more satisfied when he saw men enjoying ludicrous pictures than affecting an admiration for the tragic *Medea* or the *Perseus and Andromeda*, or the *Achilles and Briseis*.

RAPHAEL, who was the earliest to revive the imitation of the Roman figures, realised their suitability to serve as a foil to his great pictures which were intended to appear as warrants for the claims of the Popes. The variety of scales, the absence of relation between the figures, the general playfulness of the groups of men, children and animals, and the apparent absence of all purpose but that of pleasing the simplest people, which can be seen in the decorative work of the Loggie of the Vatican, combine to form as wonderful a contrast as could well be devised to the biblical scenes above them. We may grant that the quantity of elements in the decoration is in excess and that more unpainted parts would give repose, but an objection of that kind does not diminish the value of the arabesques. We can only guess at the character of the work in the Baths of TITUS which inspired RAPHAEL, and in his experiment he may not have made sufficient allowance for the smallness of the galleries when compared with the halls of the ancient building.

The extraordinary variety of the subjects introduced in the Loggie is as surprising as the execution. We can hardly imagine that RAPHAEL prepared a schedule of the different figures that were to be employed in the panels, and it would be no less difficult for one of his assistants to make the attempt. We see a heterogeneous collection of objects, and although there is more or less correspondence between the panels in the disposition—that is to say, large figures, cameos and gems will occupy similar positions—there is no relation between those which are introduced on the majority of panels. Admirers of the Roman school will not, we hope, be offended when we say that the Loggie recall NICHOLAS BOTTOM'S account of his dream, "I have had a dream—past the wit of man to say what dream it was. Man is but an ass if he go about to expound this dream." There is no profit in attempting to analyse what RAPHAEL has collected. If we can find pleasure in the variety, that should be enough to explain the reasons for their adoption. They form, as it were, a dream-fugue, and it is sufficient if they combine in leaving a delightful memory in the mind.

It would be an error to believe that RAPHAEL'S decoration can be imitated by representing subjects in such a way as to make them appear as a fortuitous collection. That course would be taken as no more than a parody. On the other hand, a deliberate effort to treat arabesque according to the usual canons of art rarely succeeds. The arabesque frieze which WILHELM VON KAULBACH introduced as subordinate to his great paintings in the Berlin Museum is now admired by everybody. The idea is ingenious, for it suggests the development of man, which is the object of the larger works. But in the frieze the characters are children and animals that are combined in a sort of running ornament. The whole is humouristic but subtle. Visitors object to the frieze because they consider it is more difficult to interpret than the series of paintings which are crowded with figures, for the frieze can only be suggestive of children's games which adults do not always comprehend, while every one of the paintings expresses its meaning to all. KAULBACH'S frieze is, however, as perfect as we can ever expect from a historical painter. Men of his eminence do readily lay aside their lofty manner. Their efforts will correspond with GOLDSMITH'S description of what JOHNSON would do if he attempted to write fables—the fishes would all talk like whales.

If we take it for granted that arabesque should be a representation of something that, while delicate, graceful and pleasing, does not suggest too much deliberation, it must be confessed that very few ancient or modern examples exist which will serve as models. The paintings by MM. GUFFENS and SWERTZ, which we reproduced several years ago, are of the same species as KAULBACH'S. Children appear as representatives of the different regions of the

lobe, but the humour consists in their acting exactly as their seniors would do under similar circumstances. If the faces could be made to appear older and the contours were lightly altered of the nude figures, the scenes would become representations of the lives of men and women in Europe, Asia, Africa and America. There is no suggestion of childishness anywhere, and without that quality there is no true arabesque. RAPHAEL proved by his single figures in the Farnesina how much could be done in making children types of great powers without ceasing to be natural, and it must always be regretted that the world is not enriched by compositions from his hand in which several of them could appear. He was the only great master who appears to have been competent to undertake the painting of arabesques, or the simple was to him as easily produced as the sublime. It was probably owing to the difficulty of employing natural forms that so many chimeras were introduced in the composition of arabesque. The criticism to which a frieze like KAULBACH's would be subjected would have no avail of centaurs, sphinxes, syrens, dryads, fauns and winged genii were liberally introduced. A piece of decoration in which they were employed could not be judged by the canons that are applicable to paintings from the life. It is possible to obtain with the aid of imaginary figures a variety of lines which could only be gained with the human figure by subjecting it to processes of distortion. Beside, when humanity is imitated, it is not easy to bring the composition into subordination to more important works of a similar class. There are, for instance, figures in the panels of the Loggia which are as finished in detail as any of the sculptural characters above them, which form RAPHAEL'S "Bible." It must be allowed that the copies of cameos, gems, vessels, armour, trophies, &c., on the panels are compensation for the elaborateness of the human figures and subdue their prominence; but something else is needed to bring the ornamentation of the panels into the objection that is needed.

With figures that are only creations of the fancy, the lightest treatment is allowable. It was probably from seeing painted decoration which did not suggest high relief that PETRONIUS applied the term *compendiariam* to designate the character of the painting of his time. Painting, according to the satirist, had arrived at a state of decadence, for the audacity of the Egyptians had caused the art to become only an abridgment of itself. In other words, the figures were made almost as flat and symbolic as the hieroglyphics of Egypt, and that sort of treatment PETRONIUS could not understand. But his words are a testimony that in the time of NERO the principles of decoration were more rational than is commonly supposed.

In Pompeii, in imperial palaces, in the Vatican and elsewhere the style of arabesques and grotesques is of less importance than their signification. When used as the decoration of an architectural work, are they not expressive of a revolt against an excess of seriousness? The spirit which was exhibited in the Roman catacombs at a time of persecution, when most peaceful Pagan scenes were presented to the gaze of neophytes, which was exhibited in Gothic churches when flowers and birds were introduced and the whole officialism of religion was ridiculed by caricatures on stone that were more galling than any seen in Pompeii, still survives. It asserted itself lately in Paris, not only when pleasing subjects were introduced in some of the panels of the new Hôtel de Ville, but when artists who were established "comic designers" were commissioned to paint scenes in the styles that were familiar to them. In England we are supposed to take our pleasures sadly, and whenever a chance is offered, committees and councils will prescribe that public buildings must be embellished with pictures of the grimmest subjects that can be discovered in local or general histories. But can anyone believe there would be so much indifference about the decay of the rescues in the Houses of Parliament if they depicted scenes that could excite some pleasure, instead of executions, expulsions, exilings, partings and burials? If we must have tragedy let it at least be accompanied by other work that will suggest it has been fleeting in its effects.

Mr. Robert Woolfenden, of the firm of Messrs. Woolfenden, Thompson & Co., has joined the head office board of the London and Lancashire Fire Insurance Company at Liverpool.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary meeting of the Institute of Architects (Mr. Penrose, president, in the chair) the death was announced of Mr. H. A. K. Gribble; also of Mr. W. G. Coward, of New South Wales, killed in a railway accident.

Mr. WOODWARD alluded to the loss of Mr. Gribble, and expressed a wish that a message of condolence should be sent to his family.

The PRESIDENT announced the results of the recent examinations, and also announced Mr. W. E. P. Crompton as the Ashpitel prizeman.

Mr. BANISTER FLETCHER then read a paper on

The London Building Act, 1894.

Mr. Fletcher said the promoters of the Act, the County Council, had modified the original draft to meet the wishes of the public as put forward by the Institute of Architects. Definitions were stumbling-blocks. Lawyers shirked clear definitions, and in interpreting Acts, laymen had to fight these indefinite expressions in the Law Courts. Mr. Fletcher found fault with minor details of the Act, but commended its general stipulations. He called attention to the permissive clauses giving latitude to the County Council to select and vary rules under special circumstances, but he objected to such permissive powers. In criticising the regulations in regard of structural details he dealt among other matters with brestrummers, projections, areas, roofs, party structures, chambers, one-storey buildings, chimneys, flues and shafts, hollow walls, recesses and openings, hoardings, sheds, dwelling-houses, lantern lights and windows, yard spaces, &c.

Professor T. ROGER SMITH considered that the Act made no radical changes. The changes regarded rather minutiae and details. If in some cases the new Act might prove troublesome, it would be found to have cleared many difficulties away. The district surveyor's work was lightened by being enabled to secure that the spirit of the law was carried out rather than having to enforce the letter of the law. The relaxation from certain restrictions allowed architects to use their discretion in introducing architectural features that contributed picturesque to buildings.

Mr. H. H. COLLINS commended the new Act, but found fault with some of the minor details, and objected that there was no definition of the terms "habitable room in a basement" and "working class," and that the word "length" should have been "width," and *vice versa*.

Mr. JOHN SLATER praised the new Act. On one point he disagreed with Mr. Fletcher, as he thought the permissive powers under the Act were very valuable.

Dr. LONGSTAFF said strong arguments had been brought forward both for and against the permissive powers in the Act, but he believed in the necessity of permissive powers.

A vote of thanks, on the motion of Mr. C. Fowler, seconded by Mr. Blashill, was passed to Mr. Fletcher for his paper.

EMOTIONAL ARCHITECTURE AS COMPARED WITH CLASSICAL.*

(Concluded from last week.)

WHEN, therefore, turning from this our contemplation we compare the outworking of the vital processes of nature with the so-called creative activity of the average man of education and culture, we wonder at the disparity, we seek its cause. When, after having with joy observed the quality of identity and singleness that nature imparts to her offspring, when with aroused expectancy, with a glowing sense of the richness, fulness and variety that might and should come from the man's brain with the impulse of nature's fecundity flowing through it, we seek—we are amazed to find in this man's work no such thing. When we, in place of a fertile unity which we had hoped for, come suddenly upon miscellany and barrenness, we are deeply mortified, we are rudely shocked.

We are dismayed at this. That man, nature's highest product, should alone have gone awry, that with remarkable perversity he should have strayed; that for the simple and obvious he should substitute the factitious, the artificial.

The cause needs not a long searching, it is near at hand. It lies precisely in that much-glorified, much-abused word, "education."

To my view no word in the entire vocabulary of the English language contains so much of pathos, so much of tragedy, as this one pitiful word, "education," for it typifies a fundamental perversity of the human soul, a wilful blindness of the mind, a poverty of the heart.

For one brain that education has stimulated and strengthened, it has malformed, stupefied and discouraged

* A paper read by Mr. Louis H. Sullivan at the Convention of the American Institute of Architects.

thousands. Only the strongest, only the masterful can dominate it and return to the ownership of their souls. For it is education's crime that it has removed us from nature. As tender children it took us harshly away with stern words, and the sweet face of our natural mother has faded in the unspeakable past, whence it regards us at times, dimly and flittingly, causing in us uneasy and disturbing emotion.

And thus it is through a brutish and mean system of guidance, through the density of atmosphere that we have breathed, that we are not what our successors may easily become, a race filled with spiritual riches in addition to vast material wealth.

That in place of a happy people, open-eyed children of nature teaming with beautiful impulses, we are a people lost in darkness, groping under a sooty and lurid sky sinister with clouds that shut out the sunshine and the clear blue heavens. Yet the murky materialism—the fierce objectivity, the fanatical selfishness—of this dark age of ours, in this sense the darkest of all dark ages, is so prodigious, so grotesque, so monstrous, that in its very self it contains the elements of change; from its own intensity, its own excess, its complex striving, it predetermines the golden age of the world.

The human mind in all countries having gone to the uttermost limit of its own capacity, flushed with its conquests, haughty after its self-assertion upon emerging from the prior dark age, is now nearing a new phase, a phase inherent in the nature and destiny of things. The human mind, like the silkworm oppressed with the fulness of its own accumulation, has spun about itself gradually and slowly a cocoon that at last has shut out the light of the world from which it drew the substance of its thread. But this darkness has produced the chrysalis, and we within the darkness feel the beginning of our throes. The inevitable change, after centuries of preparation, is about to begin.

Human development, through a series of vast attractions and perturbations, has now arrived at a materialism so profound, so exalted, as to prove the fittest basis for a coming era of spiritual splendour. To foresee this necessity, consider but a moment the richness of our heritage from the past, its orderly sequence, its uplifting wave of power, its conservation of force.

Think of the Hindoo, with folded hands, soaring in contemplation thousands of years ago—think of what he has left to us. Think of the Hebrew man coming out of Ur, of the Chaldees, to find for us the One Great Spirit. Think of the sombre Egyptians, those giants who struggled so grimly with fate—think of the stability they have given to us. Think of the stars of Israel singing in the morning's dawn. Think of the lonely man of Nazareth breathing a spirit of gentleness of which the world had never heard before. Think of the delicately objective Greeks, lovers of the physical, accurate thinkers, the worshippers of beauty. Think that in them the Orient, sleeping, was born anew. Think of the Goth, and with him the birth of emotion as we know it. Think of modern science which has taught us not to fear. Think of modern music, arising in glory as the heart took wings—a new thing under the sun. Think deeply of the French Revolution and democracy—the utterance of freedom, the beginning of the individual man. Think now of our own age with its machinery, its steam power, its means of communication, its annihilation of distance. Think of the humanitarianism of our day. Think, as we stand here now, in a new land, a promised land that at last is ours, think how passionately latent, how marvellous to contemplate is America, our country. Think that here destiny has decreed there shall be enacted the final part in the drama of man's emancipation, the redemption of his soul.

Think of these things—think of what they signify, of what they promise for us, and think then that as architects it peculiarly behoves us to review our own special past, to forecast our future, to realise somewhat our present status.

Summoned to answer before an enlightened judgment-seat, how shall we now give other, alas! than a wretched accounting of our stewardship? How shall we excuse our sterility? We surely need to inquire, for we must need explain the emaciation of our art in the midst of plenty, its weakness in the midst of strength, its beggarly poverty in the midst of abundance.

By what glamour or speciousness of words shall we persuade a wrathful judgment toward kindness? How can our vapid record be made to plead for us?

Shall we summon the clear-eyed intellectual Greek or the emotional and introspective Goth to bear witness that we stand as ambassadors in their names? We would surely be repudiated.

Shall we call to the fateful Egyptian or the dashing, polished Assyrian? One would scorn us, the other would flout us.

Who are we, then, what are we, and how shall we explain our sinister condition, our mere existence?

Shall we claim second cousinship to Europe, or must we, before we can ourselves behold the truth, so far abase our heads as to acknowledge that we of this great and glorious ending of the nineteenth century have not a characteristic nobility in our

art, that we are merely lineal descendants of the original bastards and indiscretions of architecture?

Or, still seeking excuses in our *fin-de-siècle* pocket, shall we plead in the language of myth that our art, like Brunehilde, lies sleeping; that she awaits a son of nature, one without fear, to penetrate the wall of flame, to lift her helmet's vizor?

Dreading the storm, shall we seek shelter under the spreading plea that poets are born, not made; that if nature for all these centuries has not brought forth a great master-spirit in the architectural art, it must be for very good reasons of her own, for reasons definitely interwrought with the beneficence of her own rhythmical movements. That with her endless fecundity there must be a profoundly significant reason for this barrenness.

Or, perhaps, shall we simply say that men have now turned to other gods, that they have forgotten the ancient deities?

That there has arisen in our land a new king who knows not Joseph; that he has set over us taskmasters to afflict us with burdens?

All these pleadings may be true, yet after all they do not explain why we make easy things very difficult, why we employ artificial instead of natural processes, why we walk backward instead of forward, why we see cross-eyed instead of straight-eyed, why we turn our minds inside out instead of letting them alone; they do not explain why we are so vulgarly self-conscious, so pitifully bashful, so awkward in our art, so explanatory, so uncertain that we know anything at all or are anybody in particular, so characterless, so insipid, so utterly without savour. They do not explain why the intellectual and emotional phases of the architectural mind do precisely the wrong thing when the right thing is now quite as attainable as ever.

No. I pretend to advocate the real, the true cause of my generation, of my art. I do not wish to abase them except in so far as he who loveth chasteneth. I know that the secret of our weakness lies not only in our plethoric dyspepsia, in our lack of desire, in our deficiency of gumption and moral courage, but that it lies primarily in the utterly purposeless education we have received.

I know that the architectural schools teach a certain art or method of study in which one is made partly familiar with the objective aspects and forms of architecture. I know that this, as far as it goes, is conscientiously and thoroughly done. But I also know that it is doubtful, in my mind, if one student in a thousand emerges from his school possessed of a fine conception of what architecture really is in form, in spirit and in truth; and I say this is not primarily the student's fault. I know that before entering his architectural school he has passed through other schools, and that they began the mischief; that they had told him grammar was a book, algebra was a book, geometry another book, geography, chemistry, physics, still others; they never told him, never permitted him to guess for himself how these things were actually intense symbols, complex ratios, representing man's relation to nature and his fellow-man; they never told him that his mathematics, &c., came into being in response to a desire in the human breast to come nearer to nature; that the full moon looked round to the human eye ages before the circle was dreamed of.

Our student knows to be sure, as a result of his teaching that the Greeks built certain shaped buildings, that the Goths built certain shaped buildings and that other peoples built other buildings of still other shapes. He knows, moreover, if he has been a conscientious hewer of wood and drawer of water, a thousand and one specific facts concerning the shapes and measurements and ratios of the whole and the parts of said buildings, and can neatly and deftly draw and colour them to scale. He, moreover, has read in the philosophies or heard at lectures that the architecture of a given time gives one an excellent idea of the civilisation of that time.

This, roughly speaking, is the sum total of his education, and he takes his architectural instruction literally, just as he has taken every other form of instruction literally from the time he was a child—because he has been told to do so; because he has been told that architecture is a fixed, a real, a specific, a definite thing, that it is all done, that it is all known, arranged, tabulated and put away neatly in handy packages called books. He is allowed to believe, though perhaps not distinctly so taught, that, to all intents and purposes, when his turn comes, if he wishes to make some architecture for Americans or for this generation at large, he can dip it out of his books with the same facility that dubs a grocer dipping beans out of a bin. He is taught by the logic of events that architecture in practice easily becomes a commercial article, like a patent medicine, unknown in its mixture and sold to the public exclusively on the brand.

He has seriously been told at the school and has been encouraged in this belief by the endorsement of people of so-called culture, that he can learn all about architecture if he but possess the attributes of scholarship and industry. That architecture is the name of a system of accredited, historical facts as useful, as available and as susceptible to inspection as the books of a mercantile house.

Everything literal, formal and smart in his nature has been encouraged, the early and plastic glow of emotion and sensibility has been ignored.

He has been taught many cold, many dead things, but the one warm living thing that he has not been taught and apparently never will be taught, is the stately and all-comprehending truth that architecture, wherever it has appeared and reached a spontaneous culmination, is not at all what we so rashly call a reality, but, on the contrary, it is a most complex, a glowing and gloriously wrought metaphor, embodying as no other form of language under the sun can do the pure, clean and deep inspiration of the race flowing as a stream of living water from its well-spring to the sea.

He has not been taught that an architect, to be a true exponent of his people, of his time, must possess first, last and always the sympathy, the intuition of a poet; that this is the one real, vital principle that survives through all places and all times.

This seeking for a natural expression of our lives, of our thoughts, our meditations, our feelings, is the architectural art as I understand it, and it is because I so understand it that, ignoring the viciousness of the past, I gladly make an appeal to the good that is in human nature—that goodness of heart and soundness of head, that ready and natural response of the soul in which I have always trusted and shall always trust. It is to this sane and wholesome quality that I plead for the abiding sincerity and nobility of our art. It is to this manliness that I call to come before the judgment-seat and make an answer for us.

I know very well that our country will in due time possess the most interesting, varied, characteristic and beautiful architecture; that the time will begin whenever we take as our point of the departure the few and simple elements of architecture and not its complex forms. That this time will come just so soon as the young are relieved of the depressing weight of a factitious education, the benumbing influence of an instruction that insulates them from the vitalising currents of nature. Just so soon as those having them in charge, coming to the full sense of the fact, realising how truly dangerous a thing is a little knowledge, a partial knowledge, dreading to resume the responsibility for stunted, for imperfectly developed natures, feeling how deeply necessary it is that a technical or intellectual training be supplemented by a full, a rich, a chaste development of the emotions, shall say to the young that they are free, that from the musty school they may fly to the open air, to the unshined, to the birds, the flowers, and wanton and joyous in their own fancies, face to face with the integrity of nature, they shall substitute for the arbitrary discipline of the school the natural, the easy self-control of a dignified manhood, to the end that not books, but personal feeling, personal character and personal responsibility shall form the true foundation of their art.

It has, alas! for centuries been taught that the intellect and the emotions were two separate and antagonistic things. This teaching has been firmly believed, cruelly lived up to.

How depressing it is to realise that it might have been taught that they are two beautifully congenial and harmonious phases of that single and integral essence that we call the soul, that no nature in which the development of either is wanting can be called a completely rounded nature.

That, therefore, Classical architecture, so-called (meaning the Greek), was one-sided and incomplete because it was almost exclusively intellectual. That the emotional architecture (meaning especially the Gothic) was likewise one-sided and incomplete, however great and beautiful its development of feeling, because of the almost total absence of mentality. That a complete architecture has not yet appeared in the history of the world because men, in this form of art alone, have obstinately sought to express themselves solely in terms either of the head or of the heart.

I hold that architectural art, thus far, has failed to reach its highest development, its fullest capability of imagination, of thought and expression because it has not yet found a way to become truly plastic. It does not yet respond to the poet's touch. That it is to-day the only art for which the multitudinous rhythms of outward nature, the manifold fluctuations of man's inner being, have no significance, no place.

That the Greek architecture, unerring as far as it went—and it went very far indeed in one direction—was but one radius within the field of a possible circle of expression. That, though perfect in its eyesight, definite in its desires, clear in its purpose, it was not resourceful in forms; that it lacked the flexibility and the humanity to respond to the varied and constantly-shifting desires of the heart.

It was a pure, it was a noble art, wherefore we call it classic, but after all it was an apologetic art, for while possessing serenity it lacked the divinely human element of mobility; the Greek never caught the secret of the changing of the seasons, the orderly and complete sequence of their rhythms within the calmly moving year. Nor did this self-same Greek know what we now know of nature's bounty, for music in those

days had not been born; this lovely friend approaching man to man had not yet begun to bloom as a rose, to exhale its wondrous perfume.

That the Gothic architecture with sombre, ecstatic eye, with its thought far above with Christ in the heavens, seeing but little here below, feverish and overwrought, taking comfort in gardening and plant life, sympathising deeply with nature's visible forms, evolved a copious and rich variety of incidental expressions but lacked the unitary comprehension, the absolute consciousness and mastery of pure form that can come alone of unclouded and serene contemplation, of perfect repose and peace of mind.

I believe, in other words, that the Greek knew the statics, the Goth the dynamics of the art, but that neither of them suspected the mobile equilibrium of it—neither of them divined the movement and the stability of nature. Failing in this, both have for ever fallen short and must pass away when the true, the poetic architecture shall arise—that architecture which shall speak with clearness, with eloquence and with warmth of the fulness, the completeness of man's intercourse with nature and with his fellow men.

Moreover, we know, or should by this time know, that human nature has now become too rich in possessions, too well equipped, too magnificently endowed that any hitherto architecture can be said to have hinted at its resources, much less to have exhausted them by anticipation.

It is this consciousness, this pride that shall be our motive, our friend, philosopher and guide in the beautiful country that stretches so invitingly before us.

In that land, the schools, having found the object of their long, blind searching, shall teach directness, simplicity, naturalness; they shall protect the young against palpable illusion. They shall teach that, while man once invented a process called composition, nature has for ever brought forth organisms. They shall encourage the love of nature that wells up in every childish heart and shall not suppress, shall not stifle the teeming imagination of the young.

They shall teach, as the result of their own bitter experience, that conscious mental effort, that conscious emotionality are poor mates to breed from, and that true parturition comes of a deep instinctive subconscious desire. That true art, springing fresh from nature, must have in it, to live, much of the glance of an eye, much of the sound of a voice, much of the life of a life. That nature is strong, generous, comprehensive, fecund, subtle; that in growth and decadence she continually sets forth the drama of man's life. That through the rotating seasons, through the procession of the years, through the march of the centuries, permeating all, sustaining all, there murmurs the still, small voice of a Power that holds us in the hollow of its hand.

TESSERÆ.

Microscopic Examination of Stone.

THE practical value of microscopical examinations of stone is much greater than that of ordinary metallurgical productions. In the one case we have a natural production about which we can do nothing without an investigation. In the other case we have an artificial material made for a distinct and definite purpose, to effect which we must needs know more or less of the characteristics and relative reactions of the individual elements constituting the desired compound. The tests ordinarily applied to building stone to determine its physical proportions, although few in number, are in some instances rather complicated and often unreliable. The first and most essential is to determine the structure and character of a stone, to know whether it be granite, sandstone, quartzite, or something else. Although an expert can usually determine at a glance to which, if any, of these groups a particular stone belongs, it is frequently possible to determine the precise lithological character only by a microscopical examination. Thus, for instance, there is a class of Cambrian rocks commonly called sandstones (Potsdam?) that are not sandstones at all, but are hard, compact rocks known as quartzites, which have been derived from sandstones by metamorphic action. The essential difference between a sandstone and a quartzite lies in the presence of secondary silica between the quartz granules comprising the latter; the presence of this secondary silica or quartz can be determined for a certainty only by microscopical means. The microscope is not only useful in determining the structure of a stone, but it has an even greater practical value in making it possible to detect the presence of deleterious substances such as pyrite and marcasite (iron sulphides) or other minerals whose chemical composition is affected by atmospheric agencies and thus exert a deleterious effect upon the stone. The application of the microscope to this, as to every purpose, requires some skill and training, which may, however, be readily acquired by any one to whom the subject is of sufficient interest, microlithology being thoroughly treated in standard works available to all.

Hangings in English Houses.

We are told that the Saxons had their rough and unsightly walls hidden by wall cloths, and that in a Saxon monarch's palace they were purple dyed; but tapestry or hallings, as such luxurious hangings were called, were only partially used in the kingdom until the thirteenth century, but in the succeeding centuries they were universal in the halls of the wealthy, and the richly-worked stuffs of Arras and Brabant were greatly in demand, and large sums were paid for them. They were worked in gold and colour, and enriched with incidents from sacred history or scenes from ancient romance exhibiting chivalric exploits; these were frequently rendered explicit by sayings and mottoes, streaming on scrolls from the mouths of the principal personages, such explanations becoming household words, and hence originating much proverbial wisdom. Simpler and less costly hangings were patterned over with fleur-de-lis, roses and heraldic insignia; and in the fourteenth century, if not earlier, the village of Worsted, in Norfolk, produced a fabric that yielded comfort to the living chamber of the middle classes—the manufacture taking the name of the place from whence it originated. Though the tapestry was often surpassingly rich, yet the choicest piece was displayed behind the seat of the owner of the hall—it was called the dorsel or dorser. The embellishments figured upon it were either arms, monograms or damask patterns, as may be seen in illuminated MSS.

Sketching from Nature.

Drawing has a great charm for hundreds who never desire to exhibit their pictures in public, and who do not even care for fame of a humbler sort amongst their friends and acquaintances. Quiet, self-withdrawn, observant seekers of the beautiful and the good, it is enough for them that the dew glistens on the grass, that the sun shines, that the sky is blue. Their pleasures are simple and therefore their pleasures are continuous. A weed gives them enough matter for meditation. Nature is one vast harmony and their ears are never closed; a gallery full of the most brilliant tints, and they go in and out as they list and see with keener eyes than their fellows. The simplest curves of a leaf or the bloom of a petal gives them as much pleasure as most men would experience in the Trosachs or amongst the Devonshire valleys. The purple of the horizon in the flattest country, the dash of shadow upon the meadow, or glow of sunshine upon distant hills—these, amongst the commonest sights of the commonest landscape, fill them with joy. And withal, the current of their lives runs so calmly, so peacefully, one might almost be tempted to apply to them the Psalmist's words, "They come not into misfortune like other folk, neither are they plagued like other men." The keenest thrusts of trouble never seem to strike them down. The arrows of envy or malice glance off from them, harmless. The little annoyances of daily life do not annoy them. And in great trials, too, they show bravely. Their grief is less petulant than the grief of others. Is it that they feel less deeply? No, it is because (strange as the paradox may seem) they feel more deeply that they sorrow less. Living much amongst realities, they are less amazed when they stand face to face with real trouble and affliction, with the last great reality—death—than those who live with the phantoms of the world and are ever chasing phantoms of fashion and wealth and pleasure. In their solitary communings with nature they have learnt deeper lessons than those merely of the palette and the brush; they have seen fairer visions than of green leaf or purple tree-trunk; have heard finer harmonies than the rising wind makes, or the restless surge, or singing bird of sweetest note. There are, it may be, so many kinds of voices in the world and none of them without signification to the attentive ear. And in these men the imagination is generally healthy and strong. Their eye stops not at the outer husk and sensuous appearance, but pierces through and through, observing all, taking note of all. And while fancy's idle dart glances off from the hard armour of seeming in which all things are wrapt, for disguise or for security, the weapon of imagination is of the finest temper and can penetrate to their heart, to the root and origin of their being. At any rate, the true lover of nature, the naturalist, the sketcher, finds somewhere a charm, cradled in the heart of creation, which is of mighty force to assuage vain regrets for the past, to drive away the small troubles of daily life, and to throw a brilliant lustre upon the hopes and the aspirations of the future.

Architecture and Nature.

Not nature but industry taught man to model the uncouth and misshapen stump which in primitive times supported the roof of his habitation, and industry at length gave birth to that art which introduced magnificence of design, uniformity of structure and elegance of execution, and prescribed the form of those different orders of architecture upon which the eye of taste loves to dwell with so much pleasure and delight. In order, however, to decide whether architecture be not rather an invention of art than an imitation of nature, we need only glance at a few of those leading acquisitions upon which depend

the skill of the architect. He must, in the first place, be versed principally in mathematical knowledge; secondly, physics, or rather that part of it which regards the action of bodies operating relatively by their mutual weight and pressure, must also form no contemptible branch of his attainment; and from the combination of these two sciences there must result a third, technically termed "construction," which constitutes the principal part of the builder's skill, and consists in executing with exactness and solidity whatever projection may be delineated upon paper. Guided by the rules which result from this threefold knowledge have such stupendous fabrics been erected as have for past ages been co-existent nearly with the world itself. Nature furnished us with the quarry, but industry extracted from it the materials with which art constructed the immense pyramids of Egypt. We must not here omit to notice how much we are indebted to art for the invention of the numerous mechanical powers which enable the workman to elevate huge masses of stone to a considerable height. Having noticed these and acknowledging them to be the result of human art and ingenuity, how can we consider architecture to be an imitative art? Whether any mischiefs have arisen by a deviation from pristine nature need not now be inquired into; the uninformed and savage man might still, it is true, have continued to erect his humble habitations of repose, and have been indebted to no projections of art for ease and comfort. Nature would have sufficed for that. But it is conclusive that without the assistance of the arts and the sciences the chieftains of ancient Rome would have wanted triumphal arches to record their victories, her citizens would have had no amphitheatres, her emperors no palaces, her gods no temples. Indeed, the more we examine in how very few particulars we are indebted to nature for models of imitation, and what a considerable accession of strength, beauty and elegance has been derived from art, the less we shall hesitate in determining that architecture is not (like the art of drawing, for instance) an imitative art, but rather an original discovery of human ingenuity, or at any rate that its imitations of nature (if any) are so very faint and far removed from the original that it may safely be pronounced to have been an art invented.

Wayside Chapels.

Wayside chapels are much more frequent in continental countries than in our own. Indeed, in travelling abroad, the pretty wayside chapels and crosses, with peasants kneeling serve more than most other things to remind us that we are away from home. In Switzerland the shingled spires of roadside chapels built on the central piers of bridges cast their shadows into many a snow stream. In France and Italy they are equally numerous. They are of much diversity of form, some being square or oblong, whilst others are built upon triangular, hexagonal and circular plans. There are numerous examples of chapels built of two storeys in height, as at the gorgeous Sainte-Chapelle at Paris. In these instances the upper chapel, which was on a level with the principal floor of the palaces, contained the precious relics and a gallery for the royal family to pay their devotions in; the lower was appropriated to public worship. When a chapel was built over a crypt this disposition was reversed; the crypt contained the relics, and the chapel was devoted to worship. A singular example exists, about six kilometres from Mont Louis, called La Chapelle de Planès, composed of a cupola carried upon a triangular base, having a large semicircular niche thrown out from each plane. This eccentric plan is assumed by M. Viollet le-Duc to be emblematical of its dedication to the Trinity. Another curious example of an isolated chapel exists in a cemetery within the precincts of the abbey of Mont Major, near Arles. This is built upon a quatrefoil-formed plan, having a porch thrown out from one of the semicircles to form an entrance; it is surmounted by a bell turret. The most recent of French wayside chapels is that built upon the spot on which the Duke of Orleans, eldest son of Louis Philippe, met with the accident that occasioned his death. The most remarkable of the ancient continental wayside chapels, however, is that dedicated to Santa Maria de l'Epina, built upon the approach to Ponte Nuovo over the Arno, at Pisa. It is built of the rich materials of the locality, and is elaborately ornamented with niches containing statues. Those who have seen it radiant with sunshine will need no reminder of its many graces. It was erected circa A.D. 1230. Alterations and renovations, rendered necessary by its decay or destruction, have been made in successive centuries. A single thorn, said to be from the Holy Crown of Thorns, was enshrined in it, and the wayside chapel of St. Mary of the Thorn became the object of prayer and pilgrimage.

Figure Painting.

Painting conveys ideas by form, colour and light and shadow, but colour and light and shadow without form can do little; an exact knowledge of the forms of things is therefore necessary to express ideas clearly, and the power of representing things exactly as they are, or ought to be on canvas,

constitutes the painter. We all know how many fancies and visions, how many beautiful arrangements and refined expressions pass into oblivion in our youth from the want of this power; it is this power we lag for, not ideas; the sooner it is acquired the happier and greater is the artist; yet it cannot be acquired but by never suffering an atom to remain uninvestigated and unresearched, till at last all nature is laid open, all animated being is at his disposal and under his control. The moderns equal the ancients in facility, but do not so steep it in science that it is thrown away. Facility will come from mere mechanical repetition; the great principle is so to educate your mind that when execution rushes on your hand from habitual exercise your mind may know exactly where to direct the fury of your hand. This is the great principle of art, these are the moments of rapture every man of genius sees at the end of his labours; till this delightful, stupendous power is acquired, what miseries, what checks, what struggles must he not undergo, but if he have but the resolution to proceed firmly through them, then indeed will his reward be great; then indeed will his mind, impregnated with science, and his hand, fearless by practice, be enabled as fast as visions float on his fancy to shower them on his canvas with inspired profusion. Let the rising students on whom the reputation of this country for greatness of art depends recollect that this power cannot be acquired but by acting on the same principle, from the first dawning of a wish to be an artist to the last moment of life. In the first years of study let them consider every figure they draw, as if their existence depended on its excellence, let them look and compare, scrutinise and alter; what they cannot see distinctly in shadow let them carefully examine and ascertain; let them draw exactly what they see and nothing more or less; let them get a perfect knowledge of things as they are before they presume to alter the model before them, if but the thousandth part of a hair's point.

Roman Collectors.

That so little of the wonderful accumulation of precious objects with which Rome overflowed has come down to our time—that the gold and silver, and even the bronze, should have been melted and transformed into other shapes—is not surprising, but how few examples remain of the vessels of agate, onyx, crystal and the precious murrhine which so abounded in the Roman palaces. Mithridates is said to have possessed 2,000 vases of precious materials. According to tradition, the "coupe des Ptolémées" in the Bibliothèque Nationale formed a part of this collection, but where are the 999? The consular personage of whom, without naming him, Pliny tells the odd story that he showed his affection for a murrhine bowl which had cost him a sum equal to about 5,000*l.* by gnawing its rim, possessed such a quantity of vessels made of that precious material that they filled the private theatre which Nero had constructed in his gardens beyond the Tiber. Yet not one solitary vessel has come down to our times which has a fair claim to be deemed an example of "murrhine," as corresponding with the minute description of that substance by Pliny. The great naturalist and others tell us that murrhine was imitated in glass, and fragments of glass vessels are found near Rome which correspond very fairly with Pliny's description. Mr. Story-Maskelyne has shown very conclusively that murrhine was in all probability agate brought from India, the colour of which had been reddened by the application of heat, as is now actually done in that country. Among the Roman collectors, the line between those who collected rarities of nature, and those to whom art was everything, was much less sharply drawn than is usually the case at the present day. This seems to characterise a primitive era of collecting. We find the same thing in the collections of the sixteenth and seventeenth centuries; and still more among the Chinese, of many of whose most valued works of art it may not unfairly be said, "Materies superabat opus." The Romans vinced this propensity to value an object more for the rarity of its material than for the art which it evinced, by the extravagant prices which they gave for objects of precious material when they were of more than common size or beauty. Petronius is said to have given a sum of more than 60,000*l.* for a single cup of murrhine, which he broke to pieces at his death in order to disappoint Nero of its possession. From 10,000*l.* to 10,000*l.* was no uncommon price for a table of thuya of large size and perfect in its markings, or as our upholsterers now say, pattern. These sums would seem incredible, but the statements are so frequently made, and by so many authors, that it seems impossible to doubt their substantial truth. It must, however, be owned that many among them paid most handsomely for works in which, on the contrary, "materiem superabat opus;" for although Roman silver plate was much more solid and heavy in proportion to size than that of our day, 100 sesterces (say 50*l.*) was about the price of a pound of melted silver; and Pytheas sold his work at the apparently fabulous price of 50*l.* per ounce. Doubtless none of the finest samples of silver work have reached us, but those which do

survive enable us to judge how admirable Roman plate often was, both in design and execution.

The Collection of Charles I.

After the death of Charles I. foreign princes were eager to enrich their cabinets with the works which his superior taste had selected. The pictures which formed that part of the royal gallery called the Mantua collection alone cost the King 80,000*l.* The Lord Abbot Montagu, almoner to Queen Henrietta, and many other noblemen and gentlemen, had presented the King with paintings. One of the first acts of Oliver Cromwell and his adherents after the death of the King was the disposal of the pictures, statues, tapestry hangings and other splendid ornaments of the royal palaces. Among the distinguished purchasers of this valuable plunder was the Cardinal Mazarin. The ambassador from Spain, Don Alonzo de Cardenas, purchased a number of the finest pictures in the royal collection, and sent them to Madrid, where they now remain within the walls of the Escorial. Christina, Queen of Sweden, purchased several pictures of great price, and many of the choicest medals and jewels. The Archduke Leopold expended large sums for many of the best pictures, which were sent into Germany. Some splendid and rich tapestry, wrought for Charles when Prince of Wales, was also purchased by Leopold, which found its way again into England, being repurchased at Brussels for the sum of 3,000*l.* by Frederick Prince of Wales. The greater part of the royal collection was appraised and sold by order of the Parliament, several paintings belonging to which produced higher sums than those at which they were valued. The pictures at Wimbledon and Greenwich, amounting to 143 in number, were appraised at 1,709*l.* 19*s.* Pictures at the Bear Gallery and some in the privy lodgings at Whitehall, in number sixty-one, appraised at 2,291*l.* 10*s.*; among these were the Cartoons by Raphael, which sold for only 300*l.*, when a picture of the "Nativity" by Giulio Romano, fetched 500*l.* Pictures at Oatlands, in number eighty-one, appraised at 733*l.* 18*s.* Pictures at Nonsuch House, in number thirty-three, appraised at 282*l.* Pictures in Somerset House, with those which came from Whitehall and St. James's, in number 447, appraised at 10,052*l.* 11*s.* Among these a "Sleeping Venus" by Titian sold for 1,000*l.* and a "Madonna" by Raphael sold for 2,000*l.* "Venus de Pardo" by Titian sold for 600*l.*; it was appraised at 500*l.* This and a great number of the finest pictures sold in the same proportion. Pictures at Hampton Court, in number 332, appraised at 4,675*l.* 10*s.* In the committee-rooms at the Parliament House were pictures valued at 119*l.* Pictures at St. James's, in number 290, appraised at 12,049*l.* 4*s.* Among these two pictures of the same subject, "Playing a Satyr," sold for 1,000*l.* each. "Hercules and Cacus" by Guido Bolognese sold for 400*l.* The statues at Somerset House belonging to King Charles were appraised and sold by the council of state. In the gallery 120 pieces of sculpture, 2,387*l.* 3*s.* In the garden of Somerset House twenty sculptures, 1,165*l.* 14*s.* At Greenwich 230 statues, 13,780*l.* 13*s.* 6*d.* In the armoury of St. James's twenty-nine pieces of sculpture, 656*l.*

The Gothic Revival.

Mediæval art owes its revival to the labours of three individuals, viz. Rickman, Blore, and above all, Augustus Welby Pugin. The first did the great service of distinguishing the various styles and publishing books to guide researches. The second, who was one of the most minute and beautiful architectural draughtsmen the world has ever beheld, throughout a long and active practice erected numerous buildings with correct detail. But it was reserved to A. W. Pugin to wake up people by his enunciation of true principles; and although his sharp satire doubtless hurt the feelings of many, it did immeasurable good to everybody in the profession. But Pugin was only one man, and the most gifted can only do a certain amount of work. It was, therefore, lucky that the subject was taken up by the much-abused Cambridge Camden Society, and right well they did their work: by means of patient investigations of parish churches and by means of most unsparing sarcasm, they at last drilled architects into building churches by recipe. No one at the present day does build a bad church, such a church as was too often seen at the time, and therefore let all honour be given to the Camden Society. Rickman and Blore went in for Perpendicular. The majority of the Peel churches were built in Early English, because as Beresford Hope observed that style was supposed to survive more starvation than any other. Pugin practised in many styles, but his forte was in French Flamboyant. The Ecclesiological Society enjoined Decorated. Now all this was mere architecture, or rather the bones of the building without the flesh. Mr. Ruskin arrived to supply the deficiency and to point out the intimate connection between good sculpture and good architecture; he also directed people's attention to the beauties of Early French Gothic and afterwards to that of Italy, although his lessons in the latter have hardly been understood as they should have been.

NOTES AND COMMENTS.

THE valuation and assessment of house property in England cannot be considered as satisfactory, and a more equitable distribution of taxation would follow if the Irish precedent were imitated and a Government Valuation Department set up. An attempt is to be made in the next session to remedy some of the abuses which prevail in the Metropolis. A Bill has been lodged by the London County Council which proposes to repeal the London Assessment Acts of 1862, 1864, 1869 and 1884, and to re-enact some of the provisions of these Acts in an amended and codified form. The 126 clauses which are contained in the Bill comprise within them the whole of the clauses of the Valuation (Metropolis) Bill, which was introduced into Parliament last session as a Public Bill. It is proposed to establish a "London County Valuation Court," to consist of three members, one of whom shall be a barrister or solicitor of not less than ten years' standing, one a member of the Surveyors' Institution of not less than ten years' standing, and one shall be a person, not being a barrister, solicitor, or surveyor, who shall have some experience in the assessment of property. The members of the Court are to receive such a salary as the Local Government Board may decide, and are to be entitled to a Civil Service superannuation allowance. The duties of the Court will be to decide all questions of valuation, whether in the nature of appeals by the Council against the valuation list of any assessment committee, or appeals by ratepayers against their assessments.

THE Local Government Board have ordered an inquiry into the conditions of the water-supply of Downpatrick, which deserves the attention of other people besides sanitarians. Recently a very large sum of money was expended on the works. A large reservoir was constructed. When the water was supplied to the town it was not fit for drinking. People who made the experiment became very ill. Sir CHARLES CAMERON was asked to analyse the water and declared it to be dangerous. The medical officer of the district arrived at a similar conclusion. The evil was caused by a layer of peat at the bottom of the reservoir, which was not covered with cement, or rendered innocuous. It is remarkable that the engineering surveys, the public investigations by Government officers, and all the tests which are gone through before money is advanced for sanitary works, did not discover the existence of a square foot of peat. We must, therefore, suppose either that the investigations were conducted with culpable negligence, or that in the course of a year or two a stratum of peat 6 or 7 feet in depth and extending over the area of a large reservoir could be formed. According to geologists the change from wood into peat as into lignite and coal needs a long period of time. There are certainly no precedents to explain the expedition of the peat-forming process in the North of Ireland, but then the physical and moral laws which rule other countries have no power in the western isle. Some will say the affair is only another example of the want of foresight on the part of Irish engineers and contractors, through which so many millions of English money have been wasted in efforts to improve that country. The most remarkable fact connected with the case is that the Government inspector who reported in favour of the scheme has been deputed to investigate its break-down. When will a Chief Secretary be found with courage to overhaul the engineering arrangements which prevail in the Irish departments?

WE lately noticed the catalogue of the books on architecture in the public library of Liverpool. That collection, excellent as it is in quantity and quality, will not bear comparison with what is to be found in the public library of Boston, U.S., which requires a catalogue of three hundred closely-printed columns. The books are classed in twelve divisions, viz bibliography, biography, dictionaries, history and theory, periodicals, periods and styles, architecture of countries, illustrations of architecture, architectural details, technical details, building laws, contracts, &c. There are of course subdivisions; the eighth division, for example, relates to amphitheatres, asylums, baths, castles and palaces,

churches and cathedrals, commemorative monuments, commercial and public buildings, conservatories, domestic architecture, fountains, libraries, parks and gardens, prisons, railroad stations and buildings, schools, colleges, &c., stables and barns, theatres. The whereabouts of every book in the library is marked in the catalogue, and it is not necessary, as in so many English libraries, to waste time before an application for a book is handed in. There is also an index to authors and another to places and subjects. Suppose a student seeks examples of knockers. He can see at once that GRAVENBROCH'S "Raccolta di Battitori a Venezia" is in the library; or if he should be anxious to ascertain whether the qualities of sandstone were grappled with in days when chemists and geologists were unknown, he can at once lay his hand on OPDERBECKE'S "Die Bauformen des Mittelalters in Sandstein." Anyone who is thinking of a voyage to Europe or the East has only to look for the names of the towns he is likely to visit and he will find a list of books referring to them. Thus for Canterbury there are STANLEY'S, WILLIS'S, OWEN'S, besides DART'S and DRAKE'S and GOSTLING'S which were published in the last century. Not one of them, we believe, is to be found in the public library of Canterbury. In preparing the catalogue it is evident the principle that "Time is money" was observed. It would be a great advantage if our English librarians would condescend to take a hint from their brethren in Boston. Although so comprehensive a collection of English, French, German and Italian books is in this country only to be seen in the British Museum, yet with similar catalogues the books in English libraries could become more useful.

A NEW pulpit for the parish church of Framfield, Sussex, has been dedicated. It is designed in the style of the fifteenth century. On plan it is five sides of an octagon, and the upper portion is of wainscot oak, while each side has a moulded arched panel, the ornamented cusping springing from moulded capitals having circular shafts. Over each arch is a crocketed hood-mould with carved finial, the same moulding being carried round at the springing line as a connecting string to the composition. The hollow mouldings are enriched with pearl-like ornaments, and on either side of each panel is a small V-planned pinnacle having a floriated termination. At the five angles are detached pentagonal hollow-sided shafts with carved finials. The top of the pulpit is finished with a moulded cornice, enriched with a species of embattlement and by carved pateræ, the spandrels between the cornice and the arched panels having trefoil cusped perforations. The panels are filled with sculptured figures in high relief, i.e. OUR LORD in the act of teaching in the centre, flanked by the four Evangelists with their respective symbols, each standing on a moulded pedestal. The lower part of the oak portion of the pulpit is finished with a moulded plinth, carried round the detached shafts at the angles. The pedestal is of polished mottled alabaster, with a boldly moulded capital and base. The steps are of Portland stone. The whole of the oak is left clean from the tool. The pulpit is a gift of Mr. BARCLAY WATSON. The work has been executed by Mr. FORSYTH, from the designs of Mr. B. EDMUND FERREY, F.S.A., who carried out the recent extensive works to the church.

ALTHOUGH Mr. SEARLE'S new work on "Quantities" is not complete, yet the four parts which have appeared are enough to indicate its character. We may safely assume that it will surpass all the preceding works on the subject. The author has extraordinary analytical power, which he utilises in his exposition, and any ordinary student can follow the instruction without difficulty. As the pages are quarto in size they enable grouping to be effected, which permits a student, as it were, to perceive some of the most important relations of the subject at a glance. The varieties of type employed also facilitate the acquirement of knowledge and make reference much easier. If the treatise is completed in the style of the parts in print there is no doubt that Mr. SEARLE'S work will become the standard authority on the subject.

THE MODERN THEATRE OF THE CONTINENT.

By EDWIN O. SACHS.

(Concluded from page 401.)

Orchestra.

AS to the orchestra, of course the dimensions and position varies greatly according to circumstances. A small dramatic house I once noticed had a string orchestra stowed away behind a grille in one of the upper boxes at the side of the proscenium. These upper boxes are generally almost valueless to the manager, and hidden music is certainly always very fascinating. The grille should be of bamboo. Iron gratings would change the sound of the music. Speaking of grilles and gratings, gentlemen, I would just mention that theatres in Mohammedan countries require grilles to a certain number of the private boxes reserved for the native ladies. In the Khedive's Opera House at Cairo I noticed the architect had apparently forgotten these essentials, and some ugly makeshifts in the form of semi-transparent curtains were used. One could see the ladies quite well. We generally find it in its usual place abroad, just in front of the stage, though generally sunk deeper into the floor than in England. Wagner always made a point of having a sunk orchestra for his operas, and he built one on these lines in his Bayreuth Theatre. What is good for Wagner's music does not, however, hold good for a light opera by Strauss or Sullivan, and hence the new invention abroad of a movable orchestral floor regulated by hydraulics. The first movable floor was completed last month at the new Wiesbaden Theatre. Of course there was much witticism as to the new arrangement, and during a rehearsal a wag even pulled one of the levers so that the whole orchestra bodily rose while attempting to play a passage with a gradual crescendo. A spectator tells me the situation was rather comic. The idea of the movable orchestra is, however, very good, and there is little doubt that it will soon be introduced in all theatres which have the great variety of programme I explained. Most orchestra wells abroad can of course be made larger or smaller, to suit special requirements. An extra row of stalls is either put in or left out. Great care is taken to provide good exits for the orchestra, and no connection between the stage mezzanine and the orchestra well is allowed. It is necessary that the orchestra should be quite at ease as to its position, for by continuing to play, whatever may be happening on the stage, panics can be prevented.

Now, gentlemen, this finishes the "Front of the House" as far as I can refer to it to-night. The field is an enormous one, and I can only touch on its outskirts. There are numberless interesting details that I should like to speak about, but, as I said when I started, I must limit myself to the chief features. Before entering stageland I will just say a few words as to the safety of life in theatres.

Safety.

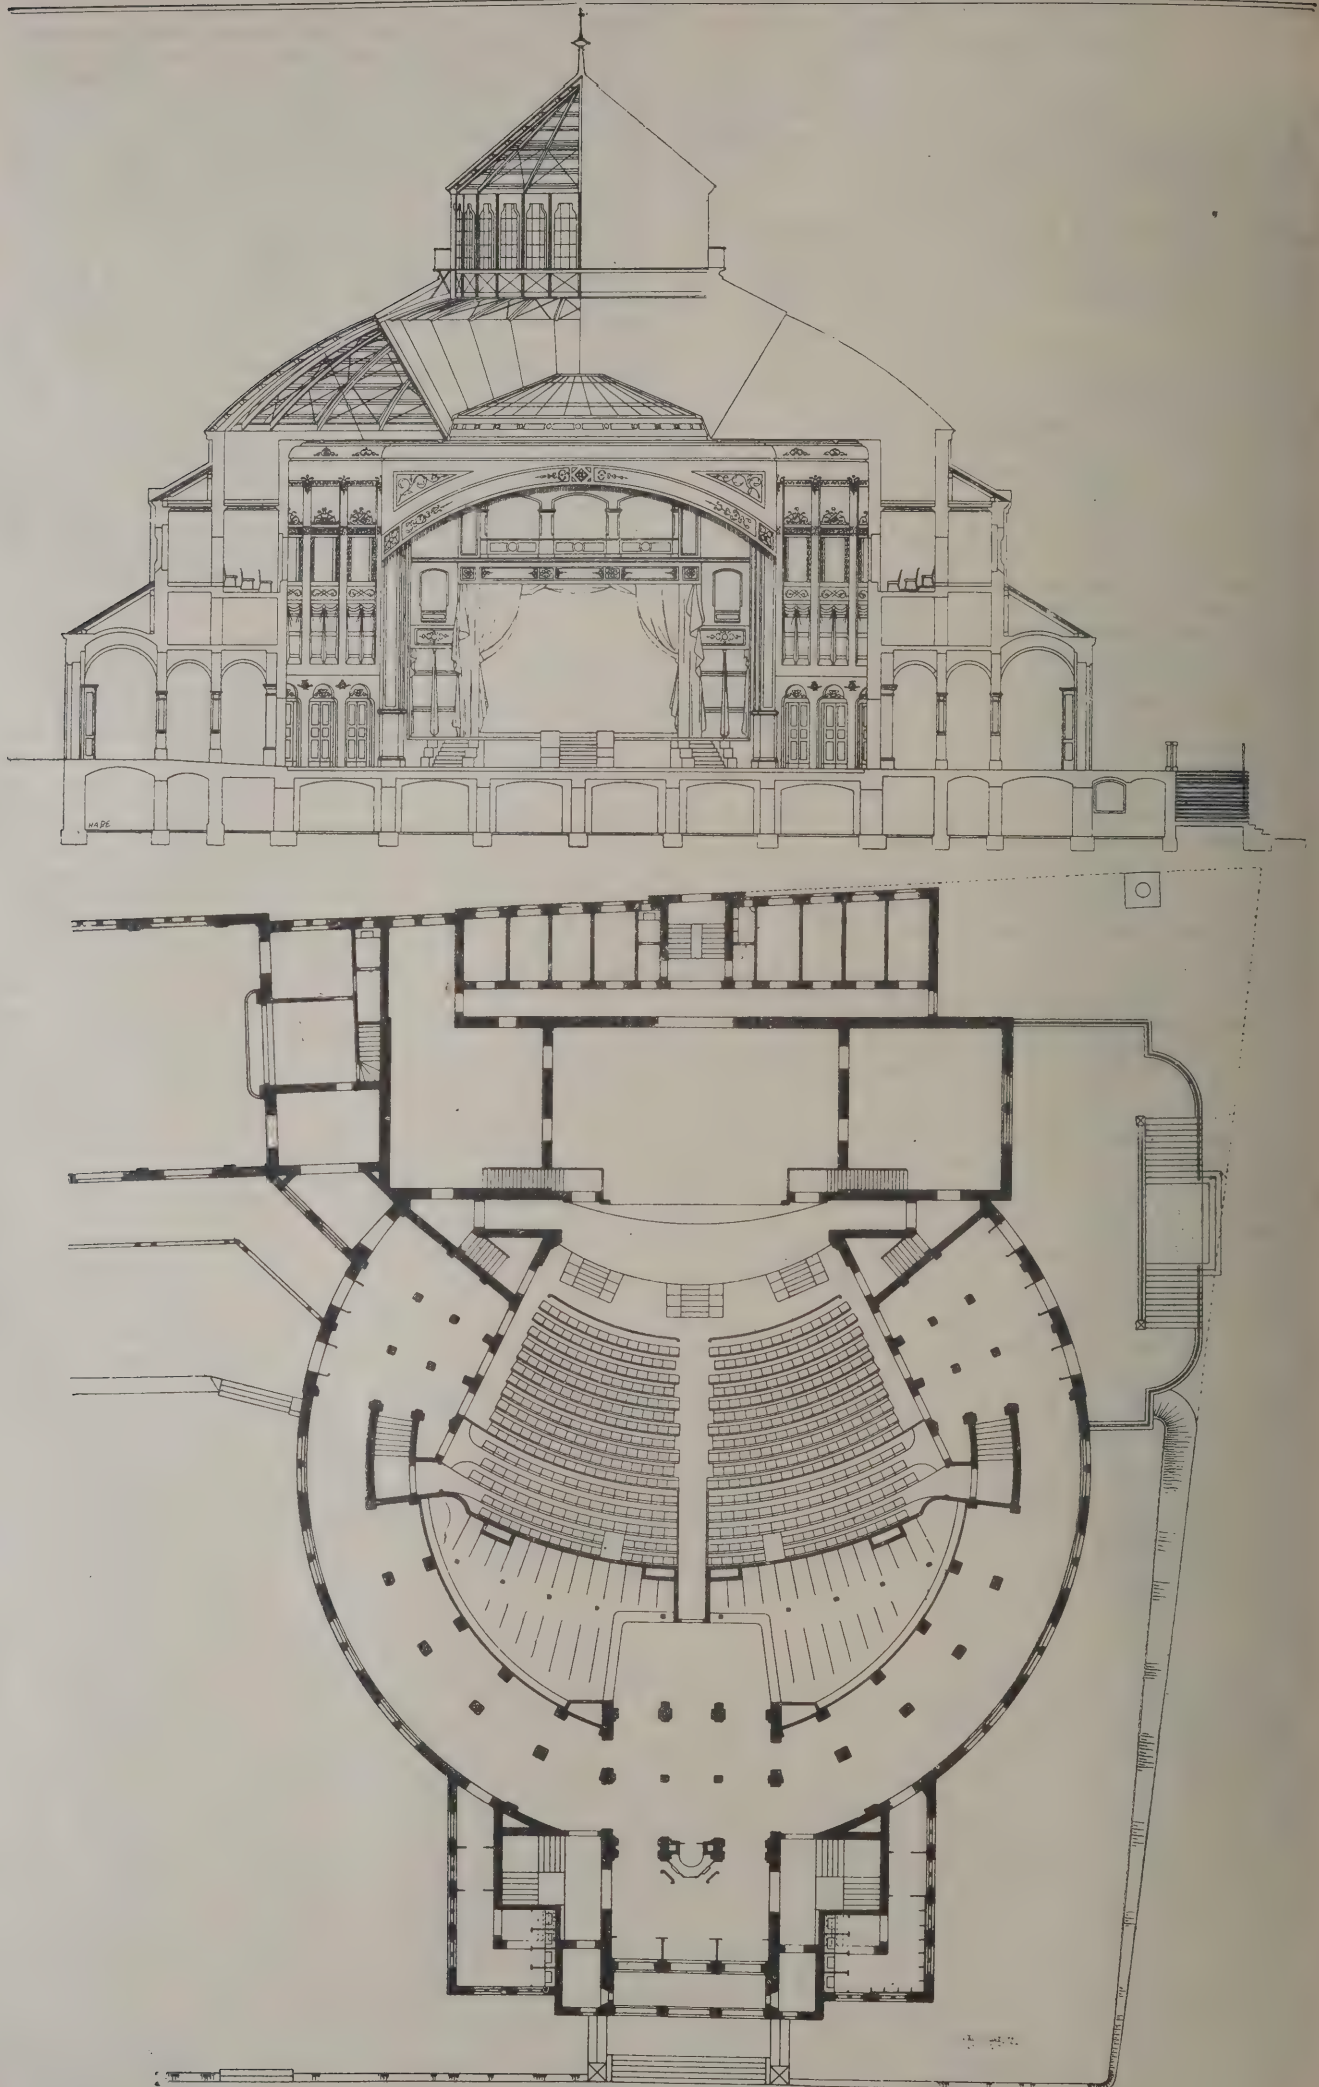

To my mind, as I said before, life is of major importance, and the building of minor consideration, and this especially holds good in this country, where losses by fire count for nothing, and fires are even considered to be good for trade. Where life is the only consideration, perfect means of exit in case of panic comes first, and then the reduction of the risk of panic caused by fire, by good lighting and warming appliances, cleanliness, careful stage management, slow combustion, stage plant, and perhaps the isolation of the building. As long as the staircases are well planned they can be of wood. Fire-extinguishing apparatus is almost superfluous. If the property is to be saved, the building must be divided into a number of "risks," both horizontally and vertically; it should be built of slow-combustion materials, should have its own well-manned, fire-extinguishing appliances, and not be too far from organised outside help. Whatever care be taken to save the audience it will, however, not count for much if they cannot help themselves by keeping their heads, and likewise whatever is done for the building, it is minimal compared to the advantages of the manager and his employes being practical men who are cool in

all emergencies. An authority asked, at a Parliamentary committee of inquiry, to explain London's immunity from theatre catastrophes, simply put it down to "luck." Nothing of the kind. Our immunity from catastrophes is due to the average Londoner's temperament and the clearheadedness of our workmen. The little flare we saw at a notable first night not many weeks ago close to the Strand would have caused a stampede in France or Italy. I remember seeing an audience up and partly off in panic on account of a few sparks off an electric contact in the auditorium. A limelight accident, as we had it at another theatre last winter, would, I regret to say, have made almost any continental stage carpenter leave his post. Our stage carpenter's pluck and smartness, his cap and coat, have saved hundreds of lives that must necessarily have been lost if we had a panic in one of our mouse-traps. Our bright sportsmen and athletes, who are at the most amused if something goes wrong on the stage, and our young ladies, who seem to keep their heads better in real emergencies than the so-called weaker sex of any other country, have almost saved as many. You will, perhaps, ask how I account for Germany's immunity. It is not clearheadedness there, but simply the continual careful plodding fire survey, and the custom of having strong fire watches of the picked men of the city fire brigade on the stage which prevents catastrophes. The German stage carpenter is not a smart man, and the audiences easily take fright.

Stage.

The most remarkable features of the continental stage are its appliances. Stage mechanism is being treated as a science. Capable, scientifically-trained engineers replace the stage carpenter of old. The only wood to be found on or about the modern stage is generally in the stage floor, and here hard oak or teak is used. The reform is a *bona fide* one, not merely an adaptation of the old stage to suit modern requirements. The monstrosity of rows of "flies," and footlights which throw their glare upwards on to the actor's chin instead of downwards on to his forehead, is gradually being done away with. The streak of limelight that used to follow the actor about will soon be forgotten. To illustrate the effects of our present ridiculous lighting arrangements, Professor Herkomer, R.A., has kindly put two interesting sketches at my disposal for the evening. Both vividly show us, if I may call it so, "reverse" lighting. There are two systems of *mis-en-scène*, the one requiring a possible imitation of nature, the other attempting the simplest indication of general surroundings. For the imitation of nature, the so-called "horizon," the careful grouping and the rational method of lighting are as essential as the scene-painter's handiwork. For the indication of surroundings all attempts at perspective should be avoided. A well-painted background and monochrome drapery instead of "flies" will suffice. The skill of the first-class engineer will, of course, only be wanted where the possible imitation of nature is required. With hydraulics at his disposal, he will be able to supply every want of the artist without any cumbersome crowding of the stage with all manner of platforms and supports. It is impossible for me to-night to enter into a description of modern stage appliances. I would only remark that the system of the Vienna "Asphaleia" Company, the first attempt at entire reform, is gradually being improved upon. The great reformers of the modern continental stage are the engineers Messrs. Brandt (Berlin), Christofani (Buda-Pesth), Bretschneider (Vienna), Lautenschlaeger (Munich), Richter (Darmstadt) and Rudolf (Vienna). As far as the risk of panic and fire is concerned, the iron stage does not perhaps have quite as many advantages as are generally ascribed to it. The canvas scenery always remains, and if it commences to burn the heat engendered will soon destroy everything and probably the iron roof first, thus soon causing a general collapse. I show a photograph of a fire at a panorama I saw at Vienna. The one large canvas sheet which caught fire almost immediately destroyed the roof. Canvas burns terribly rapidly and fiercely. Electric lighting is of course a great improvement as far as safety is concerned, but absolute reliance on immunity from fire on account of its introduction would be reckless indeed. Some authorities I know consider an iron stage lighted by electricity practically safe. At Warsaw, for instance, I visited the old opera house, which was being renovated regardless of expense, and found that the architect had purposely not allowed for an iron curtain on account of the electric light and modern stage machinery. Of the disadvantages of iron stages let me mention their effect on the acoustics of the building, the difficulty of giving the stage a comfortable temperature in winter time, and further, the greater risk of accidents to the employees. To improve the acoustics the top of the stage is generally kept full of canvas, and this of course means an extra risk. Sprinklers, for instance, cannot be as effective where the streams of water are constantly blocked by rolls of canvas.

This brings me to the protection of the stage in the case of a fire having broken out. Abroad, reliance is almost entirely placed on the firemen with their buckets of water and hydrants close at hand. Next come the sprinklers. The

THE PEOPLE'S THEATRE, WORMS.
Herr March, Architect.

ventilation flue over the stage and the great divisional iron curtain are to prevent the spread of fire in the direction of the auditorium. Hydrants with good reliable pressure, and hose and branch attached ready to be run out, are always provided in the continental theatre in great number, and I would here remark that the cock can generally be opened with one movement only. Of course the firemen belong to the local brigade and stand under the municipal officers. Sprinklers are very common abroad in the new theatres. I had little faith in them for theatre risks until May last, when I saw them tried at the Buda-Pesth Opera House. The stage was literally flooded; the first deluge was already sufficiently formidable to swamp the largest fire. The rows of sprinklers are generally divided into sections abroad, so that if necessary the force can be localised to one particular spot and the danger of unnecessary water damage avoided. The ventilation flue, which is nearly everywhere found over the stage and can be easily opened, is considered a safeguard for the audience in the case of hydrants and sprinklers failing. The smoke and the fumes will be drawn away from the auditorium. The danger of having ventilators is the possibility of their being opened too soon, say before any water has been brought to play on the fire. The flames would then be fanned and the spread facilitated. The divisional curtains are everywhere introduced abroad, and at present the only question ever raised is as to the advisability of having double curtains, either in form of second asbestos protector or a water sheet. Without a ventilation flue over the stage the curtain will be pressed into the auditorium by the expansion of air on the stage. To my mind it is almost useless to lower a curtain without having this flue. It is true that I have not seen a curtain "blown out," but experiments were made at Vienna with a model of the unfortunate Ring Theatre, and the "blowing out" repeatedly proved within about twenty seconds of the fire obtaining a hold. As in the case of stage appliances, I unfortunately cannot enter into detail as to the construction of iron curtains abroad, but those interested will find drawings of some of the latest examples. The following four stages are fully illustrated:—

Buda-Pesth National Opera House, engineers, The Asphaleia Co. (Vienna).

Halle Municipal Theatre, engineers, The Asphaleia Co. (Vienna).

Vienna Hofburg Theatre, engineer, Herr Brettschneider (Vienna).

Rotterdam Municipal Theatre, engineer, Herr Rosenthal (Cologne).

The first two show the original Asphaleia system, the third improvements by Herr Brettschneider, and the last a simple adaption of the old wooden stage to modern resources.

Stores and Dressing-rooms.—The only thing remarkable about the stores abroad is the ample space allowed, both where the main stores are in the same block as the audience, and where there is only a secondary store and the main storage is outside the building. Where main stores are inside there is always a double wall, some 4 feet apart, between the stage and the stores, to prevent spread. In some cities the main stores have to be outside the building. This, of course, means much wear and tear and extra labour for the management. The St. Petersburg and the Paris theatres have very extensive buildings for storage purposes only. You will find the plan of one of the St. Petersburg stores on these walls. Besides enormous quantities of scenery it holds some 135,000 costumes and 20,000 pieces of armour.

Dressing-rooms are generally well arranged on the Continent, but the absence of bath-rooms is remarkable. The lavatory accommodation does not come up to our requirements. One thing has always been forgotten in continental dressing-rooms as regards the safety of the employées, and this is the proper arrangement for heating curling-irons and paint, though very practical electric appliances have been invented. I remember a case at Berlin when a Gaiety Company was there. The young ladies had a special liking for antediluvian spirit-lamps, candles and other curious arrangements of the most dangerous kind, which in every way annulled the advantages of good construction, electric lighting and the absence of drapery in the dressing-rooms. The Gaiety girls would not listen to reason—in fact, whenever their dressing-rooms were inspected, they simply formed a ring and danced round and worried the officers, so that the latter were only too glad to let the matter drop. I should recommend the necessary electric appliances for curling-irons and paint to be provided as fixtures.

A PEOPLE'S THEATRE.

And now, gentlemen, I must close with a few remarks on a people's theatre. You see the drawings of the Worms Theatre, built from the designs of Herr March, of Berlin. When the building was put up Worms had 23,000 inhabitants; that is to say, as many as Winchester or Reigate of our provincial towns, or Gravesend and Richmond of our London suburbs. Worms wanted a theatre. Everybody in the town was ready to sub-

scribe and the Town Council also found that a little money could be taken from the rates. Everyone was satisfied if the playbill was limited to drama, and it was immaterial if the pieces were put on to the stage with a full *mis-en-scène* or only the indication of the surroundings I referred to. There is a good deal of democratic spirit in Worms, and hence a distinct division of an audience into sections would not have pleased the inhabitants. The best men of the town were to have the best seats, but they were not to be isolated. An assembly-hall was also required in the town, and as a combination of the two buildings meant a saving both of the initial outlay and the maintenance, a block not unsimilar to those of the national societies I just spoke of was decided on. The plans explain themselves. The Bayreuth system of seating was adopted, the lines only being more curved, which does not make it so oppressive for an audience as in the Wagner Theatre. The best seats have a central position. All use the same entrances, the same lobbies and the same cloak-rooms. The best seat costs 3s. 6d., and the front rows, which are rightly considered to be the worst, 6d. For chamber drama the stage is used with a simple indication of the surroundings; for grand drama there is a full *mis-en-scène*. The stage has a depth of 27 feet when measured from the front of the platform to the back wall, and its width is 48 feet. These dimensions will be found to be between those of the stages of our Haymarket and Daly's Theatres. There is no orchestra well. An organ has been placed at the back of the auditorium, where there is also a gallery for a band or a choir if necessary. Exclusive of the seating accommodation in the gallery, there is room for an audience of 1,200, or with it for 1,400. The auditorium already looks well filled with an audience of about 800 or 900. Again, I cannot go into detail, but I would mention that the audience has thirty-three exits at its disposal, and that the auditorium has a large central top-light, so that the hall can be used for public meetings in the daytime, and the cleaning is greatly facilitated.

As to the cost, the whole establishment, theatre, assembly-hall, restaurant and grounds, with all necessary furniture, fixtures, and a sufficient supply of scenery to start the management, would cost 610,000 marks, or 30,500*l.*, which, with the prices of labour and materials in this country and the higher value of ground, would mean about 40,000*l.* The 30,000*l.* were collected as follows:—First, there was mortgage money to the extent of 7,500*l.* on the property, lent by the Municipal Bank at 3½ per cent. The interest for this mortgage can be easily covered by the refreshment contractor's rentals, who has the monopoly of catering in the place. Then 11,500*l.* were collected by voluntary subscription; 5,000*l.* were allowed by the Town Council, and the remaining sum made up out of the proceeds of bazaars, lotteries and such like amusements. The Town Council undertook the maintenance of the property.

And now, gentlemen, that I have finished my paper, may I ask if municipal, subscription and people's theatres should not be encouraged by architects as buildings which lend themselves to architectural treatment in the best sense? Shall we really soon see this class of building in our country is a second question. Will institutions of this kind find favour? And lastly, gentlemen, can we structurally improve upon our private theatre of to-day by studying what has been done abroad under different circumstances?

Mr. R. ROBERTS expressed himself in favour of municipal theatres, but he doubted if English people, who were not an artistic people, were yet sufficiently educated to appreciate them. He thought the County Council would subsidise a scheme for municipal theatres. In theatre construction the first object should be the safety of the public. He preferred perfect isolation for theatres, but owing to expense of site, &c., that was not practicable.

Mr. MULHOLLAND also favoured the idea of municipal theatres. Something of the sort existed in the provinces, but they were, however, the worst managed theatres in the country.

Mr. LEON thought people would object to pay the necessary rates for municipal theatres on religious grounds.

Mr. BLASHILL alluded to the ordinary rule in Germany, even in villages, that theatres should be isolated.

Mr. W. D. CARÖE said he thought sites were cheaper in Germany than here.

The proceedings closed with a vote of thanks to Mr. Sachs for his paper.

EVOLUTION OF AMERICAN ARCHITECTURE.*

WHEREVER humanity has wanted a tenement, a temple or a tomb, the desire has developed into a feeling extending beyond absolute need and more profound than individual caprice. In all ages the expression of this feeling has been wrought upon the anvil of necessity with the hammer of

* A paper read by Mr. J. W. Yost at the Convention of the American Institute of Architects.

human sentiment. Its expression has ever been true to the impulses of the human heart and has developed a glorious architecture under the spur of human aspiration. Every nation of history has welded into forms of beauty and harmony a knowledge of the past and a capability of the present. In the evolution of architecture in its various phases that which a period provided was what the past had used, recast in a mould of the present. Thus architecture became an art of precedence and a science of necessity.

While every people has written its own feeling in its own lines, the abstract principles which govern all architectural expression are universal and unchangeable. Details change and compositions vary with every fancy of the designer, but the influence of a line, a form or a colour remains the same everywhere. A straight line never has the influence of a curve; a vertical line never produces the effect of a horizontal line; a sphere never the effect of a cube, and red never the effect of green. Each element of design preserves its own influence throughout all composition and under all circumstances, like the letters of the alphabet in every production of poetry and prose.

In the title of this paper I have purposely excluded the words "order" and "style," both being too narrow in their present signification to express my conception of what the architecture of this country will be when its evolution has produced a homogeneity of expression. If the law which has governed the production of every variety of architecture throughout history is not to be set aside in the development of the architecture of this country, its character, when compared with that of all historic work, will be as broad as our civilisation is broad when compared with the civilisation of historic times.

No nation has heretofore existed possessing the multiplicity of wants we have. No people ever before possessed the personal freedom of taste and the ability to provide an expression for it that we have. No style of architecture has ever been produced under such a variety of climatic influences as this country affords. Never have the designers and the builders of any country had at their control such a varied supply of building materials and building appliances. Never have a people of any age or clime possessed such a complete knowledge of what all previous periods have done, nor had at their command such ready means of full communication with each other and with everybody else. Probably no nation of people was ever made up of so great a variety of races, nationalities and antecedent conditions as exists with us.

Gather together people from every nation of the earth, with their inbred fancy for the work of the mother country, supply them with means of comparison of what each likes with what all the others like, and with what the ancestry of all have liked, and then set before them the variety of materials and building appliances that all the world can supply, and let them express all their wants under all the conditions the country develops; then crystallise the whole result into a distinctive expression, and the word "style" must be greatly broadened in its signification in order to truly define the production. If anybody has expected to see, or has expected our posterity to see, in the architecture of this country something so exclusive as the Greek orders or even the Gothic styles, his expectation will probably never be realised.

There has been some impatience expressed because there has not been a final acceptance by the profession of some historic style as the key or starting-point from which our future design must be developed. There seem to be those who think if the profession would only agree upon some style as the best one for our purposes it could be adopted as the "American style," and all future work made to follow its lines, at least sufficiently near to be considered its legitimate offspring. Some of our professional schools, while doing an excellent work, have in some way been led into the idea that some particular type of architecture from a foreign country or previous age is better than all others, and capable if adapted reasonably of answering all requirements as the antecedent type of American architecture—but not all of the schools agree which particular type of architecture it is which should be thus selected. The criticism of the times is largely based upon a preference for one or another style, and endeavours to measure the merits of all work according to the ideas the favoured style expresses—often condemning excellent work as meretricious, and singing high the praises of well-copied nonsense.

The impatient writers, the leaders of schools, and the self-appointed critics must all come to know that we cannot, and will not, marry our architecture—which will be vigorous, beautiful and glorious—to an architectural mummy from Egypt, France, Italy, or anywhere else, no matter in what excellent grave clothes the mummy may have been enshrouded. It has required much time for the world to grow up to an appreciation of our civilisation, and it may require much time for us to fully appreciate the fact that our architecture must grow, and cannot be imported by foreign junk dealers. We cannot, if we would, rush to a conclusion in immoderate haste. Our art must have its proper season of development

under the law of the survival of the fittest, and when it has come to full fruition it will be just as noble, when compared with former work, as our civilisation is noble—no more and no less. We will not have all of the good things that all the past styles contain, but will probably have many more good things than any one of them contains.

In determining at any time what to do, a thorough knowledge of what has been done will furnish and must furnish the surest foundation on which original thought and novelty of expression can rest, but whoever is satisfied to use what he can find, without earnest inquiry whether it is possible to do something better for the time and place, has reached the last stage of mental growth and has built a wall of enclosure about his skill as a designer. That which comes to his mind as novelty and that which comes to his eye from history must be scrutinised according to the same rule of appropriateness. The fact that one has a precedent and the other has not furnishes no reason sufficient why either should be adopted or rejected.

In the evolution of a national architecture under the law of natural selection by the survival of the fittest and under the conditions prevailing in this country, we begin by the use of first one style, then another, and then another, always terminating the experiment by softening the lines of demarcation between them, just as the settlement of the country began, first with a colony from one country, then a colony from another, and then from another. All these colonies mingle and soon the special characteristics of each begin to disappear. Then comes another colony and mingles with the others, the new immigrants having less and less influence upon the whole civilisation, in proportion as that which has come under the new environment becomes greater and greater in proportion to what comes from abroad, until by-and-by the volume of American civilisation will be so vast in proportion to the importation of foreign influences that the importation will cease to be, in any appreciable measure, a disturbing element. The peculiarities of all the races and nationalities will merge into a newly evolved human entity known as an American. If architecture is true to its principles as a delineator of ethnographic life it must follow this same process of accretion, assimilation, of elimination and crystallisation, until out of the architectural styles of all the world there will come in its own good time an expression composed of all, yet different from all, governed by new requirements and limitations, and it will be known as "American architecture."

Mr. Gothic lands upon our shores, but under a different environment from that under which "Gothic" was born and reared. He soon becomes a "Gothic American," the same as an English immigrant soon becomes an English American. Then comes Mr. Romanesque, say from France, and must pursue the same course as the Frenchman; the one becomes Romanesque American and the other a French American. The same is true with all other styles of architecture and nationalities of people. The one finally disappears in the ocean of American citizenship, and the other will disappear in the ocean of American architecture. Each is simply following the laws of evolution, the same as all civilisation and all architectural expression has done in all the past. Neither can change the inevitable course of events.

So that while we begin to form a national architecture by following the fancy from one style of historic work to another, being wonderfully particular to have each style pure, we will end—that is, our posterity will end—by practically forgetting that there ever was such a thing as an "order" or a "style." All that comes under the pencil must pass the scrutiny of the highest and best that is possible. The hand must be unshackled, the mind unfettered and free.

While none of us will live to see American architecture in its glory, while we must live out our days in the shadowed valley of the dawning of American art, yet we may see the golden glow of the morning sun as it kisses the tips of the highest specimens of art the genius of our generation can produce.

While the imagination of people and foreign ideas of art is still at flood tide, yet both have reached and passed the zenith of their influence, and henceforward from one decade to another, as the civic and artistic conditions of this country become nearer and nearer to those of other countries, these foreign influences will become less and less potential. If this be true we have reached the time when crystallisation must begin.

In one century we have grown, politically, from a provincial to a national estate, and although our civilisation presents innumerable problems and requirements in architecture, hitherto unsolved and unanswered, yet taking into account the facilities we have and the activity of our people, it is fair to presume that in one century from this time our architecture will be sufficiently differentiated from historic and contemporaneous work to form a separate chapter—we may fairly hope, a large and important chapter—in the world's book of design.

In the production of an architectural expression with sufficient breadth to answer all the requirements of our civilisation,

it will be necessary that the designer shall know not only what other countries and times have done, but he must learn the language of the elements of which all design in architecture is composed. He must also learn what sentiments can be properly written in each class of buildings; and finally he must learn what he may properly use from all the field of historic art and from all the unappropriated realm of material forms for the embellishment of any given building or any given part thereof. Here, then, are three things to learn—first, how to design; second, what to design; third, what may be used for ornament.

The three parts of which all architectural art is composed have their separate offices of varying relative importance in the various classes of buildings. As the æsthetic adds refinement to the purely technic, so again the phonetic may be considered a refinement of the æsthetic.

Naturally, in a country like ours, inhabited by a people of excessive acquisitiveness, in an age of practical things where everything is weighed in the scale of its capability of supplying human comfort, the technic or purely constructive element of our architecture will assume an importance not often if ever before reached. But this paper is not intended to discuss the purely mechanical side of the question. That only which arises above the plane of the merely necessary is now to be referred to.

That branch of art which so disposes of what is necessary as to make it ornamental—that which beautifies utility but does not reach the realm of the symbolic or ideal—I choose for present purposes to term the æsthetic branch of the subject. Inasmuch as only a small proportion of our buildings will ever rise beyond this second stage of artistic development, anything like an extended discussion of the phonetic may properly be deferred until another time. Before dismissing the technic and phonetic branches of the subject, however, it may be proper to say that the technic and æsthetic conception of any building cannot rise to the highest attainment until it takes such form and finish as to provide for the harmonious introduction of phonetic embellishment—that the highest development in the technic and æsthetic in building art will invariably lead in the direction of the greater and greater importance of the phonetic, until there comes that balance of the beautified useful and its poetic adornment which measures the zenith of possibility in plastic art. Also that the subjects of phonetic ornament may be realistic, allegorical or ideal, either in history, prophecy or contemporaneous life; but the realistic must never be a copy of nature to the extent of being an imitation, nor the allegorical and ideal so far removed as to need explanation to the average beholder, and that all subjects must have a well-known connection with the particular building, or its class, if it be other than of a private nature.

Then we face the three questions, how to speak, what to say, and with what tongues we shall speak in the æsthetic element of our designs. A comprehensive answer to either of these questions would reach far beyond the limits of this paper. It is something of an aggravation, therefore, to even suggest them under the circumstances. We pass, rather than answer, them in what follows.

A few simple entities are all that we have in which to express whatever sentiment we are to convey through the æsthetic branch of our art.

Lines, surfaces, points, volume, light and colour—these constitute the letters of our alphabet. With their infinite capacity for combination and variation they make up an inexhaustible language. Each letter of this alphabet is capable of being used in countless compositions. Each has its influence and its office, and always speaks in the same tone under the same circumstances—in the same atmosphere so to speak.

What is the meaning of a horizontal line? of a vertical line? a curved line? or a comparatively short line, or a comparatively long one, or a uniformity of lines, or a variation thereof? Each has the same influence in all possible phases of design. Each has a sentiment to express, from which it never varies. A horizontal line always expresses breadth, stability, repose. A vertical line, altitude, mobility, aspiration. A straight line, force and severity. A curved line, gentleness and submission. Long lines, sublimity and grandeur; short lines, action and intensity. A variety of lines, refinement and control; a uniformity of lines, mystery and indecision. And so on through the limitless combinations of lines which make up the inexhaustible wealth of possible design. All have their place and their purpose. Every combination will receive more or less influence from the other elements of the design, yet they never lose their significance, even when overshadowed in the picture by the power of other features.

As it is with lines, so with forms and light and colour, each one of which stands for a given sound in the harmony of the complete composition. While no complete catalogue or dictionary of this language has ever been or ever can be written, and while the subject is an unbounded field for inquiry, yet a moderate acquaintance with the general outlines of the subject lies at the foundation of any true scholarship in matters of design. And while it is the cold abstract side of the question

that is thus presented, it is in this heartless dissecting-room that we must learn the office of each component of that aggregation of entities which we call a design. It is the analysis, the taking apart of the flesh, bones and sinews, so to speak, of this thing which impresses us with its beauty, grandeur, refinement or devotion—that will give us a knowledge of how we may compose other designs to tell the same or any other story we may have to tell.

Having learned how to express any given feeling, we are next confronted with the question of what feeling to express in any given building or class. The answer to this question no man can give until he knows what feeling and sentiment surrounds the erection and use of any given building. It will vary with every change of public sentiment. In this branch of the subject the architect must be a student of the times, of the community in which he builds, of the persons for whom he builds. He must be one of the people and a leader of the people in these matters, but he must not be separate from the people.

His building must express the sentiment of those for whom it is built rather than of the architect who designs it. The highest results are only attainable, however, when the architect and his clients are in the fullest sympathy.

There next arises the question of what forms can be used to beautify that which necessity has commanded.

For the present we will do, in the matter of ornamentation, what we do in the matter of style—that is, do as we please, each one for himself—doubting the propriety of new things and continuing to copy the old, as a rule. But it is not the present only that is under consideration, and the unlimited liberty of the present will, in time, be succeeded by an intelligent restraint.

Excluding ornament by setting precious materials and by the use of colour, there are three great systems which have been in use. They have been more or less combined in the ages and styles of the past.

First.—The use of conventionalised possible but unnecessary constructive forms. Triglyphs and dentils on a Doric entablature and wall arches in Mediæval work would illustrate this class.

Second.—The use of geometric and other forms as surface ornament to change the linear and volumar effect of the structure, the forms bearing no relation to structural requirements.

The Saracenic and oriental surface ornament—the foliage, panels and festoons of the Renaissance will illustrate this class.

Third.—The beautifying of real construction by the use of geometric forms and a lithic semblance of the forms of vegetable or sentient life the lines of which seem to lend assistance in the work the ornamented portion really performs. Moulded base and the acanthus leaf on capital of the Corinthian column illustrate this class.

These methods of ornamentation rise in the scale of artistic merit in the order in which they have been mentioned. The lowest grade of ornament in an artistic sense is the decorative use of needless constructive features. The next is the use of exterior forms to modify the emotional effect of the structure. The third and highest is the beautifying, geometrically or otherwise, of real construction; and in this class that is highest in which the best geometric form is clothed in lines of lithic life.

If the architecture of all history can form a criterion, it is probable that our ornament will continue to be composed of these three classes. In fact, it is some question whether to a nation of practical people, as we are, and will continue to be, so satisfactory results can be obtained by the exclusion of the lower orders of ornamentation as by the proper harmonising of them with the higher classes, somewhat as the Greeks did, so that we may maintain a scale of ascent from the purely technic, through degrees in higher art, to the purely phonetic. As the structural element of our buildings cannot be of gold, but must be of stone, brick and wood—more earthly materials—and as we ourselves are a combination of the spiritual and the animal, it seems but right that the art, in even our highest productions in architecture, should have a foundation upon the earth, and that on its nether side the artistic spirit should come as near to the material element of the structure as possible. It is fair to expect that the three grades of æsthetic ornament will be used in the perfected type of American architecture, when it shall come.

In the selection of subjects from the vital world, not only should those be chosen which, in their lines or forms, accentuate the spirit of the design in hand, but they should, so far as possible and whenever possible, have some appropriate connection with the building or its class and with the sentiment surrounding its use. In this respect our ornament, on its subjective side, should not appeal to the mythology of history so much as to the facts and feelings of the present day and of our own country.

The art of no age or country, whether of poetry, painting, architecture or sculpture, ever rose to commanding eminence

except when founded in the very nature of those for whom and by whom it was produced. If we would have American architecture rise to that enduring importance which will challenge the admiration of future ages we must bring ourselves up to a recognition of the fact that art is a precious treasure of unfathomable, inconceivable richness, which can neither be bought nor borrowed. We may inherit some scattering jewels from a provident ancestry, we may find some diamonds in the chaotic remains of historic times, but the brightest gems in our artistic crown we must bring up with much searching from the ocean of infinite possibility. In the development of our architecture we must rise above the limitations of any style or order to a position where we may not only compare all work of all the past with reference to its adaptation to the wants of this country and our times, but where we can go beyond the concretions of all times and glean from the broad field of nature in which all styles and orders grow, and where the sum of all that has ever been done is but as a sheaf in a whole harvest when compared with that which can be done.

FORESTRY OF BRITISH PLACE NAMES.

IN his speech at the Society of Arts on the 19th inst., after the reading of a paper by General J. Michael on "Forestry," Sir George Birdwood said:—

An innate, unfeigned love for woodland lore is instinctive in the whole Aryan race, which from its earliest migrations has been associated with that great forest belt once extended across the entire breadth of the Euro-Asian continent, of which the Black Forest in Germany, the Ardennes Forest in the North of France, and the remains of Andred's Wood in Kent and Sussex, and the New Forest in Hampshire, which once linked Andred's Wood with the Forests of Dartmoor and Exmoor, and the Dean Forest, are now isolated fragments. It was in this vast temperate forest belt, extending from the Himalayas, along the Caucasus and the Imaus and the Balkans, Alps and Apennines, to the utmost British Isles, that the ancestors of the ancient Hindoos and Persians, and Greeks and Latins, and of the modern Celts, Slavs and Teutons learned their common names for the alder, apple, ash, aspen, beech, birch, elm, hazel, holly, linden, maple, oak, pine and willow; and that the European Aryans learned to worship the oak as the king of the wood, and their highest god. From Dodona to Leatherhead—"the high oracular grove"—the oak was associated with the supreme god of the Aryans, either as his sanctuary or the godhead's self. The love of trees is as strongly marked in the British and Anglo-Saxons as in every other branch of the Aryan race. I have made out two lists of place names in Great Britain, the first being of places named after woods and clearings in woods and trees generally and parts of trees, and the second of places named after trees. The following places in Great Britain derive their names from British, Anglo-Saxon and Danish words signifying woods or groves, clearings in woods, trees generically, the branches, trunks, stems and boles of trees and timber. Thus, from the Anglo-Saxon beam, a tree, we have Benfleet, in Essex, Bampton, in Oxfordshire, and Bamford Speke, in Devon; and from the Anglo-Saxon treow, a tree, Treborough, in Somerset, and Treeton, in Yorkshire; from the Danish thufe, a branch, Tufton, in Hampshire; from the British bon, the bole of a tree, Bungay, in Suffolk; from the Anglo-Saxon bol, bole, Bolton, in Lancashire, and seven other Boltons, Bole, in Northampton, Newbold, in Derbyshire, and Bolingbrook, in Lancashire; from the Anglo-Saxon stib, bole, Stibbard, in Norfolk, Stibbington, in Hampshire, Steeping, in Lincolnshire, Stebbing, in Essex, and Stepney, in Middlesex; and from the Anglo-Saxon stoc, tree stock, stem, or trunk of a tree, over 100 names of places, including Stoke d'Abernon, in Surrey, Stogursey, in Somerset, Stoke Say, in Shropshire, and Greystoke, in Cumberland; from the Anglo-Saxon tymbre, wood, Timberland, in Lincolnshire, and Timberscombe in Somersetshire. From the British bar, a bush, we have Barcomb in Essex and Barlow in Derbyshire, and from the Danish bosch, a bush, Buscot in Berkshire and Bushey in Hertfordshire, and elsewhere. From the British coed, a grove or wood, we have Coed-Arthur, Argoed, Coyty and Disgoed, all in Wales; from the Anglo-Saxon bærw (compare British bar, a bush), a wood, a grove, Barrow in Leicestershire and elsewhere, Barrow-in-Furness in Lancashire, Barrowden in Rutland, Berrow in Worcestershire, Burwarton in Shropshire, Berry Pomeroy in Devonshire; from the Anglo-Saxonholt, a wood, *i.e.* hold of wild beasts, Bergholt in Essex; from the Anglo-Saxon hlyrst, a wood, over seventy names of places, including Hurstmonceaux and Billingham in Essex and Deerhurst in Gloucestershire; from the Anglo-Saxon wæald, or wild woodland, Weald Bassett in Essex, Woldingham in Surrey, Woldford in Warwickshire, Old in Northamptonshire, Old Castle in Herefordshire, and Oldberrow in Worcestershire; from the Anglo-Saxon scua, a wood, Shaugh and Shaugh-Prior in Devonshire, Shawbury in Shropshire and Shoebury in Essex; from the Anglo-Saxon wuda,

wood, Outwood in Lancashire, Woodsetts in Derbyshire and Sherwood in Nottinghamshire; from the Danish skeg, a wood, Skegby in Nottinghamshire and Skegness in Lincolnshire, and from the Danish toft, a wood surrounding a house, thirty names of places, as Toftwood in Suffolk and Norfolk and Toftmill in Durham. From the British den and denan, and Anglo-Saxon dene, a woody dingle, we have Hastingdene in Kent, Rottingdean in Sussex and the Forest of Dean in Gloucestershire (compare Devon, the "deep valleys," *deifneint*). The Anglo-Saxon plump, a clump of trees, gives its name to Plumpton in Sussex and Northamptonshire; and the Anglo-Saxon hleoðar or oracular grove to Leatherhead, "the high oracular grove." The old French word forest (from the Latin forestis, lying without, through the Low Latin foresta), signifying an open woodland (as distinguished from an enclosed one or park), in which the king's rights of the chase were reserved, is found in the names of Forest Gate in Essex, Forest Hill in Kent, Forest Row in Sussex and of the Forest of Dean in Gloucestershire, the New Forest, Hampshire, &c. Its association with hunting is seen in the name of the town of Huntly, "the land for hunting," on the borders of the Forest of Dean; and again in the names of several places near open woodlands compounded with the word chase, as Enfield Chase and Cannock Chase. From the British clawr in its Anglo-Saxon form, clere, a clearance in a forest, we have Clawrplwyf in Wales and High-clere and Kings-clere, both in Hampshire. From the Danish thwaite, meaning the same thing, we have upwards of forty names of places in Norfolk, Suffolk and other eastern and northern counties; from the Anglo-Saxon word royd, a road cut through a forest, Huntroyd and Mytholmroyd, both in Yorkshire; and, finally, from the Anglo-Saxon erwd, ploughed woodland, we have Erwood, or Erwd, in Breconshire, Wales.

The following places in Great Britain derive their names from the British, Roman, Anglo-Saxon and Danish names for special trees. Thus the alder gives its name from the British gwern to Vern (literally the Alders) in Herefordshire; from the Anglo-Saxon alar to Alresford in Hampshire, Alrewass in Staffordshire, Ellerton in Northumberland, Orleton in Herefordshire and Orleston in Kent; and from the Norse embla to Embleton in Durham and Emley in Yorkshire. The apple, in British æpl, apal and aval (Avalon) to Applethorpe in Nottingham and Appuldercombe in Devonshire. The ash, from the British onn, to Llwyn-onn, "the ash-grove," in Wales, to Machen (plural form) in Monmouthshire and the river Onny in Shropshire; from the Anglo-Saxon aesc to upwards of 120 places, including Axminster and possibly the river Exe (which is probably Usk, if Oxus and Oxford, water) and Exeter in Devonshire and Axbridge in Somerset; from the Danish aesc to Askrigg in Yorkshire, and to several places called Askham in Nottingham, Yorkshire and Westmorland. The aspen, from the Anglo-Saxon aeps, to Epsom in Surrey, Epworth in Lincolnshire, and probably Ipswich in Essex, and from the Danish asp, to Apsley-Guise in Bedfordshire and Aspeden in Hertfordshire. The elm gives its name to nearly forty places, including Helmshore in Lancashire, Helmley in Yorkshire and Helmdon in Northamptonshire. The beech, from the British fedw, gives its name to Llwyn-y-fedw in Wales (it seems to lurk also in the later etymology of Hereford), and from the British bæcen (beeches) to Beckenham in Kent and Beckingham in Nottinghamshire; and from bæce (beech) to Bixton and Bickleigh in Devonshire, Bicknor in Monmouthshire, Bicker in Lincolnshire, Beecham Well in Norfolk and Burnham Beeches in Buckinghamshire; from the Anglo-Saxon boc to Bocking (bocen, "the Beeches") in Essex, Bockleton in Herefordshire, Boxford in Suffolk and to Buckinghamshire. The birch, from the British bedw (compare fedw, beech), gives its name to Bedwely in Monmouthshire and Beddow in Shropshire; and from the Anglo-Saxon birce to Birchington and Birchholt in Kent, Birkham in Nottinghamshire and Berkeley in Gloucestershire. The cherry, from the Latin cerasus, has been thought to give its name to Cherry-Hinton in Cambridge, to Cherhill in Wiltshire and to several places called Cheriton. The hawthorn gives its Anglo-Saxon name to nearly 100 places, including Tring in Hertfordshire and Thurning in Norfolk. The hazel, from the British celli, gives its name to Pencelli and Tregelli in Wales; and from the Anglo-Saxon hæsl, to Haslingdene in Kent, to Hesse and Heslington in Yorkshire, Haslingden in Lancashire and Hesley in Warwickshire, and elsewhere. Nutfield in Surrey, Notting Hill in London and Notgrove in Gloucestershire are called after its nut. The holly, from the British celyn, gives its name to Cwm-celyn in Monmouthshire, the Chin river and Chingunford in Shropshire, to Callington in Cornwall and Calne in Wiltshire; and from the Anglo-Saxon holegn to Holne in Devonshire, Hollington in Sussex, Olney in Buckinghamshire, Hollesley in Suffolk, and Alnwick in Northumberland. The linden or lime gives its Anglo-Saxon name to Lindsell in Essex, Lyndhurst in Hampshire, and Lindridge in Worcestershire. The maple gives its Anglo-Saxon name to Maplebeck in Nottingham, Maple Durham in Oxfordshire, Mapleton in Derbyshire and several other places. The oak, from the most ancient British dar

(compare darwydd, "druid") gives its name to Darlin, in Monmouthshire, and, indirectly, to Redruth, the "Druids' town," in Cornwall; and from the Saxon æc, to Acton in Middlesex, and elsewhere (eight places all so called), Acaster, Acklam and Ackworth in Yorkshire, Acomb in Durham, Acrise in Kent, Green Cryse in Herefords hire (where its corn or "seed" gives its name to Acornbury, as in Wales it does to Festiniog, the "acorn-land" of Merionethshire), to over twenty places called Oakham, Oakington and the like, and to about six places in which oak becomes oc or ock, as Occold in Suffolk, Ockbrook in Derbyshire, Ocle in Herefordshire and Okeover in Staffordshire. Glastonbury is called after the British name glastennen, of the helm oak; Berkshire takes its name from the polled ("pollard") oak, under which the shiremoties of that county were anciently held; while the name of Sherwood is similarly derived from the oak (here generically wuda), under which the shiremoties of the county of Nottingham were wont to assemble. The pear gives its Roman name to Purley, Purleigh and Pyrford in Surrey, Parndon in Essex, Parham in Suffolk and Paracomb in Devonshire. The pine gives its Anglo-Saxon name to Pinner in Middlesex, Pinefern in Dorset, Pinhoe in Devon and Punctestown in Wales. The plum gives its Anglo-Saxon name to several Plumsteads in Norfolk and elsewhere, and to Plumbland in Cumberland. The privet gives its British name yswydd to places in Wales, and, finally, the willow gives its several Anglo-Saxon names, purs, sahl, wil, windle and withig, respectively to Pershore in Worcestershire, Soho ("Willow Hill") in London, Soham in Cambridgeshire, Salehurst in Sussex, Saul in Gloucestershire, Salford in Lancashire, Soulbury in Buckinghamshire, Souldern in Oxfordshire, Willoughby in Lincolnshire and elsewhere, Windle in Gloucestershire, Windsor in Buckinghamshire, and a dozen Withams, Witherns, Withingtons and the like, in Suffolk, Lincolnshire and elsewhere.

You will observe that there are about 500 such place names, and what is so remarkable is that the trees thus toponomically commemorated are, with the possible exceptions of the cherry and the pear, all trees which were the indigenous forest trees of these islands before the invasion of Julius Cæsar; and the very trees I have already cited as having a radically common name among the principal Aryan races. It proves how trifling has been the influence on the Aryans of the 2,000 years of their civilised history in comparison with that of their 15,000 to 25,000 savage history, which some would indeed extend to 50,000 years. The Romans are generally supposed to have neglected the administration of the forests in these islands. Still they would appear to have added the box, the sycamore and the laurel to our woods, and the cherry, pear, medlar, quince, mulberry, fig, damson plum, vine, chestnut and walnut to our orchards and homestead plantations, and they thus immensely and permanently increased the horticultural productiveness of the country. There is positive evidence of the care for our forests shown by the Anglo-Saxons and Danes. One of the Saxon kings instituted a fine of 60s. for burning a fire in any wood, "for fire is a great thief." Canute levied a fine of 20s. on anyone cutting brushwood without permission or destroying trees and shrubs used as fodder for cattle, and in every county during the Norman times the sheriff was made accountable for the conservancy of all woods. From Domesday Book and the "Codex Diplomaticus" a very good idea may be obtained of the extent of the contemporary forests in Great Britain, and the general conclusion one comes to from the survey is that there is no country in the world which would better repay sound and systematic conservancy than these British islands. They seem to afford a kindly home to every robust timber tree and temperate fruit tree and hardy flowering plant. They are, indeed, one of the world's great natural paradises. Where we have lost our forests it has been through sheer stupidity; the most terrible example of this being the disappearance, in greater part, of the famous Andred's Wood, which once covered all the waste lands of Kent, Sussex and Surrey, and extended along the "Saxon shore" into the present New Forest, in Hampshire, but was almost totally destroyed in the seventeenth century by the reckless iron smelting then carried on in our south-eastern counties.

HIGH BUILDINGS AND GOOD ARCHITECTURE.*

I HAVE been invited to speak upon the subject of lofty buildings, from an artist's point of view. I hesitated to accept, because in general I believe it is better to work than to talk about working. Work is so much more and higher than words. And yet a comparison of views among us who are all workers may be mutually helpful. There is but little to be said upon this subject which has been assigned me, but I may hope at least to suggest a few things which will invite discussion.

* A paper by Mr. Thomas Hastings, read before the Twenty-eighth Annual Convention of the American Institute of Architects.

I will not venture to discuss the propriety of erecting such high buildings or the municipal laws that should limit their height, because that aspect of the question has been assigned to another; but I will only express my own personal convictions upon the subject.

I believe that there should be rational limitations for all buildings constructed solely for revenue. This is required by practical and sanitary considerations. From an artistic point of view my subject permits me to argue that there is nothing more unfortunate in the general aspect of a city than the necessarily broken sky lines of our streets, because of there being no legal limitation as to the height of buildings. It is almost discouraging to spend one's energies upon 50 or 100 feet of an avenue or street, when, however good the result in itself may be, we are only making a blot upon the *ensemble* of the general line of building. Legal limitations would give us that monotony so essential to the general appearance of a city, and also so essential as a background for exceptional monuments. In such a company as this it is not necessary for me to do more than allude to the rigid building laws existing in other countries than ours, in order to explain the charming unity and monotony which exist in the streets of the principal foreign cities.

Modern life and habits, modern inventions, the modern industrial and commercial spirit, perfected systems of lighting, ventilating and heating, the elevator and other practical conveniences, have of necessity imposed upon the architects of our time a new and serious problem to solve. This problem must confront us even if legal authorities finally fix a limitation as to height or number of storeys; for such a limitation can only simplify the problem and not eliminate it. It must, therefore, be solved in an artistic way. To contend that this one problem, resulting from the industrial and commercial spirit of the age, must, as has so often been assumed, determine and transform all modern architecture, is unquestionably an exaggeration. The architect of our time has practically the same civil, domestic and religious problems to solve in their many and varied forms which have been given his profession ever since classic times. The variety of problems only increases as life expands and differentiates, as is noticeable when we study the history and development of architectural style. The mere theorist is apt to make too much of what he calls an "entirely new state of affairs," and so becomes revolutionary in questions of design. The office building is only one step further in the general advancement. With the many difficulties before us, while endeavouring to design a lofty structure, we must not be discouraged, but only try to build in the most natural and logical way, adapting all precedents to this one new condition.

Before suggesting any solution of the problem, allow me to say it is both easy and permissible for me, as well as for all of us, to preach better than we have been able to practice, especially when such difficulties are before us as baffle all education and demand experience which involves failures. Therefore, I beg those of you who are familiar with any work of this kind in which I have participated, not to allow what I have done to prejudice you against any suggestions which I may be able to make concerning this matter.

It would seem as if nature had come forward to provide us with comparatively new materials in iron and steel to assist us in this new kind of work. That these materials should play a most important part in our designing it seems to me must be accepted. Our building laws, instead of hindering the architect in his design, should assist him more than they do by being properly revised. Some practical solution should be devised which would permit the use of apparent iron construction within the spirit of our laws. We might use exposed iron in a partly decorative way to indicate the constructive members which are concealed of necessity for fireproof reasons. I cannot imagine a more natural and beautiful solution than to treat these iron and steel constructions with curtain walls, by honestly showing the iron or steel on the façade, with a filling-in of terra-cotta, brick or faience, with projections constructed in apparent iron and terra-cotta. But such a solution is even more difficult to talk about than to execute. If the laws should be revised, as suggested, we could only wait for someone capable to experiment in this direction.

Let us now consider the artistic treatment that is possible under existing legal conditions. The utilitarian problem which confronts us is simply a beehive or manifold collection of similar cells with equal divisions, both lateral and perpendicular. As in all architectural study our façades should, as much as possible, interpret this interior condition of things. In order to do this there are but two principles of design which suggest themselves. One is to build a façade and to pierce it with windows equal in size and distribution, leaving equal wall-surfaces to be decorated with ornament and detail. But this would not be an artistic solution, for it is simply giving up all endeavours to meet the difficulty—for architecture should demand first of all that we know how to make openings in a wall so as to have a proper and agreeable relation between them, and to leave well-proportioned wall-surfaces. Shadows

from projections are always secondary to the deeper and larger shadows that these openings produce, and of still less importance are the lights and shadows obtained by ornament. An equal distribution of openings with ornament may be decoration, but it is not architecture. It is, as it were, decoration applied to a treatment legitimate only for light wells and rear yards—a checker-board arrangement. Any good architectural building must always look well, and be interesting to the architect when seen either at a distance or by moonlight or twilight, when only the main masses are apparent. The other principle in design is that of unequal division. To secure this, which seems to me to be the true principle, *i.e.* a large opening in contrast with a small one, or the grouping of openings together, and the proper colour and variety in wall surfaces, we must of necessity resort to combining some storeys in one *motif*. In so doing, instead of filling in these large *motifs* with stone divisions, is it not more rational to allow the steel, iron, or other construction of the interior floors and partitions to be apparent, instead of entirely masking them with masonry in the façade and destroying the true value of the openings? That is to say, is it not more rational to accentuate the *motif* by filling in with some other material different in character and colour, rather than with a pierced wall of stone? Such apparent iron construction in these *motifs* should then be treated or decorated in that light and delicate way which the nature of the material would seem to demand. This would give the composer almost absolute liberty in applying the same great principles of composition as obtain in other problems.

With such difficulties at hand, we must more and more demand from the critics and the profession alike an absolute freedom from all narrow and biased prejudices. Taste is a matter about which there are many perverted ideas. People are more sensitive about questions of taste than about almost anything else. I really believe that there has been more rubbish written in this relation than in politics or religion. Every man's taste, like his orthodoxy, is personal. It belongs to himself and to nobody else. It is therefore a very presuming thing to condemn a work of art because it does not happen to accord with your taste. Think first of what the artist has endeavoured to do, and then how he has done it. We hear men say "we know what pleases us"—but it surely requires but little taste to know that. I have heard men who called themselves architects condemn the best portions of the Louvre and other great works in architecture, because of their petty prejudices and their little formulas of good taste. They write or dogmatise in a way that is sometimes very persuasive, using superficial arguments, and perhaps applying some well-known principles, without being able to recognise the exceptions. It is difficult, in fact, to determine the difference between a prejudice and a principle. We must no more mistake prejudices for principles in art than in life. We should not be too outspoken about our prejudices, but should make proper allowance for our temperaments. Some men have so much conceit that they do not hesitate to condemn *in toto*, because of their little prejudices, works of art which have been considered masterpieces alike by artists and by an intelligent and admiring public for centuries. They write critically not only about individual buildings, but they decry entire epochs in the history of art. We must demand freedom from this.

Some men would fain settle the height and projection of a cornice before taking their pencil in hand. The pilaster need not of necessity be a buttress; a cornice need not of necessity crown the entire height of a building, simply because of the etymology of the name; this especially when the building is so high that no reasonable projection could crown it or be weighted enough to be held in place without iron. Webster and Worcester are not criteria in architecture. A pediment need not necessarily receive a roof because it was originated for this purpose. Even broken pediments, so much deplored by Purists, have been built by the greatest of artists. They cannot be said to be bad when they compose well and look well. The masterpieces of architecture of all ages contradict such theories and show them to be prejudices. While we can refer to such precedents we need not fear to build attics or to decorate with pilasters and pediments, if they look well.

The story is told of Haydn that a pupil brought to him one of the master's compositions and asked him if certain sequences were not wrong or contrary to the rules. Impatiently the master replied, "Yes, but they sound well." If a design looks well, it is well. Of course such freedom should not be carried so far as to become license.

It is right to be logical, but a work of art was never beautiful solely because logical. The most difficult thing in composition, and I believe this to be true in all art, is to know how to be simple—to be simple without being stupid and empty; to be firm and strong without being hard and angular; to have good detail, which on the one hand does not assert itself to the injury of the composition, and on the other hand is not timid for fear of a want of refinement. When a man has acquired a certain knowledge of his art, timidity is almost as bad as

vulgarity or brutality, and weakness as unpardonable as coarseness.

Therefore, in solving this exceptional problem, the "high office building," we must demand, while holding to precedents and traditions as much as possible, perfect freedom in composition, and, above all, avoid copying or adapting entire *motifs* or parts of other buildings that we have seen to these new conditions. We must compose and not copy. Only in this way will the new problem play its part among the numerous and varied other conditions of our life to influence modern architectural style in its further development.

New conditions have always demanded of contemporaneous architects a modern architecture expressive of the times, and every honest solution of this new and most difficult problem should be allowed to have its proper and natural influence upon our architecture.

GLASGOW ARCHÆOLOGICAL SOCIETY.

AT the monthly meeting of the Glasgow Archæological Society, held in the rooms, 207 Bath Street, Mr. P. Macgregor Chalmers, F.S.A.Scot., read a paper on "An Outline of Mediæval Church Architecture in Scotland," in which he traced the development of ecclesiastical art from the Roman period to the middle of the sixteenth century, when Classic art was revived. By giving views of actual examples he showed that the current opinion regarding the early structure of the Glasgow Cathedral was not in accordance with the stages of development. The early structure had only hitherto been shown to exist in the south aisle of the crypt, whereas he pointed out that there was a very large portion of the early structure still existing in the north aisle, giving a clue to the early plan of the cathedral. By this theory the early building was shown to be on similar lines to all the ecclesiastical buildings of Scotland of the same period. The paper was illustrated by a series of photographic views.

Mill Chimneys.

SIR,—After reading of the fall of so many mill chimneys during the recent storm and the consequent loss of both life and property, one cannot help regretting that such structures are still being put up, but this likely arises more from lack of knowledge than anything else.

Some little time back a design was invented somewhat on the lines of the Blackpool Tower, which has so well withstood the terrific winds of last week.

Briefly put, it consists of three lattice girders on end, tied into a bed of concrete and bound together, with an iron plate tube in the centre, which is lined about 12 feet up with fire-clay.

The patentee claims it is cheaper and quite as durable as those of brick or stone, while it is free from many of the dangers to which the latter are subject.

It can be run up any required height and will not fall, and any weakness caused by accident or carelessness is easily detected, which is not so in the case of brick shafts.

I shall be glad to supply any further information.—Yours truly,

RICHARD L. KIRLEW.

56 Clarendon Road, Manchester, S.E.:
December 26, 1894.

GENERAL.

Mr. Arnold Mitchell will deliver the Christmas course of three lectures for juveniles at the London Institution on Friday (to-day), the 28th; Monday, the 31st inst.; and Wednesday, January 2, at 4 P.M., on "English Cathedrals" (illustrated).

The Queen has approved the appointment of Mr. Frederick York Powell to be Regius Professor of Modern History at Oxford University, in succession to the late Mr. J. A. Froude.

Plans have been approved by the Kilmarnock Town Council for an extension of the waterworks at an outlay of about 5,000*l.*

The Surveyors' Institution will hold the next ordinary general meeting on Monday, January 7, when the adjourned discussion on the paper read by Mr. William Sturge (past-president) at the last meeting, "The Burdens on Real Property and Land," and on the paper by Mr. A. Dudley Clarke on "The Incidence of Taxation on Land," will be resumed.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.
